

The Journal

of the

American Pharmaceutical Association

INDEX TO VOLUME III

JANUARY TO DECEMBER, 1914

INDEX TO AUTHORS

- Ackerman, Adolph H.,
Advertising, 976
- Alpers, W. C.,
Address, 1695
American Pharmaceutical Association, His-
tory of, 1625
Request from the Historical Department,
597
Syrup of Ferrous Iodide, 420
- Amos, W. S.,
Additions to N. F., 322
- Apple, F. M.,
Calendars for Advertising, 1316
Insurance for Pharmacists, 713
Pennsylvania in A. Ph. A., 1135
Review of Current Pharmaceutical Litera-
ture, 1721
Some Dispensing Hints, 231
Synthetics, 1141
- Arny, Harry V.,
The A. I. P., 1542
- Baker, W. F.,
Digitalis, 304
- Ballenger, Edgar G.,
Gastric Disturbances, 736
- Beal, George D.,
Caramels, 495
Chemistry, Treatise on, (Book Review), 778
Collodion Membranes, 499
- Beal, James H.,
Am. Med. Education, 297
Bichloride Legislation, 161
Bichloride Situation, 483
Co-operation, 295
Harrison Bill, 4, 479
Law for Itinerant Vending, 1690
Legislative Problems, 1051
Price Protection, 8
President-Elect, 136
Professional Ethics, 619
Trade Pirates, 164
- Beath, O. E.,
Oregon Balsam, 28
- Becker, L. A.,
U. S. P. (IX) Preparations, 1023
- Beckwith, C. P.,
Adrenalin, 1547
- Bender, A. W.,
A Prescription Query, 695
- Berlinger, George M.,
Bichloride of Mercury, 1111
Invitation, 1143
Report on Standards, 873
Syrup of Iron Iodide, 970
- Bradley, Theodore, J.,
Nitrometer, 1442
- Bragg, W. H.,
X-Rays, 1602
- Briggs, C. H.,
Compressed Tablets, 31
- Bromley, A. W.,
Advertising, 738
- Brown, J. Lee,
Liquor Magnesiae Citratis, 969
- Brown, Linwood A.,
Methods of Analysis, 642
- Cadwallader, R.,
Address, 1125
- Caspari, Charles E.,
Santonin, 634
- Chambers, H. L.,
A Pharmacopoeia, 51
- Chase, Walter M.,
Biologicals, 1319
- Chillingsworth, F. P.,
Gelsemine, 315
- Clark, Ira B.,
Window Dressing, 122
- Cook, E. Fullerton,
Address, 1298
- Cooper, Zada M.,
College Examinations, A Defense, 1713
Pharmacist's Duty, 672
- Day, Wm. B.,
Hughes-Bacon Bill, 13
Retailers in A. Ph. A., 1688
- Diner, Jacob,
Autogenous Vaccines, 177
- Dodge, Francis D.,
Oils, Analysis of, 1664
- Doepfers, W. A.,
Oubain, 646
- Dunning, H. A. B.,
Formaldehyde and Methyl Alcohol Detec-
tion, 637
- Eberhardt, E. G.,
A Bibliography, 38
- Eldred, F. R.,
A Bibliography, 38
- Elliot, Vanna,
Spirits Camphor and Water, 91
- Emanuel, Louis,
The Law and the Label, 670
- England, Joseph W.,
Dreaming and Doing, 1716
Dr. William Saunders (Obituary), 1726
Joseph E. Morrison (Obituary) 277
Louis Woltersorf (Obituary) 278
- E'we, G. E.,
Laboratory Notes, 1681
- Fantus, Bernard,
Tablet Making, 72
Tablets for Children, 656
- Farwell, Oliver A.,
Rhamnus, 649
- Fell, Joseph,
Glycerin, A Substitute for, 1648
- Fernald, F. K.,
Business Relations, 85
- Ferry, N. S.,
Infection and Immunity, 558, 730
- Floyd, Henry B.,
The Laboratory Equipment of the Pharma-
cist, 569
- Forman, Leroy,
Chicory, Its Detection, 1669
Emulsions, 1444
Glycerine, Its Determination, 1644
Vanilla Extract, 25
- Frame, A. W.,
Poison Law, 663
- Freericks, Frank H.,
Harrison Bill, 1, 882
Pharmacy Laws, 55, 196, 333
- Fuller, H. C.,
Pharmaceutical Chemistry, 129
- Gardner, Robert J.,
Fluid Extract Manufacture, 997
Manufacturing Pharmacy, 1325
- Gathercoal, Edmund N.,
Frangula and Rhamnus Purshiana, 982
The Pharmacognosy Museum, 17
- Gay, Mrs. St. Claire R.,
The Pharmacopoeia, 432
Ginger, 115
Syrup of, 1576
- Godding, John G.,
Massachusetts College of Pharmacy, 77
- Gordin, H. M.,
Lloyd's Reagent, 627, 1656
- Gordon, Fred T.,
History of Homeopathic Pharmacy, 1707
Report of Section on Historical Pharmacy,
1699
- Haskell, Chas. C.,
Digitalis Leaves, 306
Ergotin and Powdered Extract of Ergot, 786
Oubain, 646
- Heidelberg, Fritz,
Metal Colloids, 799
Pituitary Gland, 808
- Helfman, Joseph,
Detroit Meeting, 489
- Hensel, S. T.,
Compound Syrup of Phosphates, 232
Magnesia Magma, 1118

- Hilton, S. L.,
Harrison Bill, 880
Petroleum Liquidum, 577
- Hitchens, A. Parker,
Antitoxins and Vaccines, 715
Sterilization, 792
- Hostmann, Jeannot,
Apparatus in a Pharmacy, 697
- Hynson, Henry P.,
All Fool's Day, etc., 1537
Difficult Things in Dispensing, 313
- Kaplan, J.,
Lloyd's Reagent, 627, 1656
- Kauffman, George B.,
The War and the Drug Market, 1533
- Kebler, L. F.,
The Tablet Industry, 820, 937, 1062
- Kline, A. J.,
Edible Mushrooms, 434
- Kraemer, H.,
Medicinal Plants, 111
- Lascoff, J. Leon,
Camphorated Oil in Ampoules, 689
- Latham, Thomas,
The Liniments of the U. S. P. and N. F., 234
- Laube, J. E.,
Poisons, 257
- Lawall, Charles H.,
Chicory, Its Detection, 1669
Emulsions, 1444
Extract of Vanilla, 25
Law, the Letter of, 326
Liquor Antisepticus, 507
Liquor Antisepticus, Alk., 508
Magma Magnesia, 1002
Mercury Estimation, 50
Pennsylvania Laws, 1025
Review of Phar. Literature, 1593
Separatory Funnel, 498
- Leet, R. A.,
Advertising Methods, 1318
- Lindley, John M.,
A Suggestion or Two, 1173
- Little, L. D.,
The Determination of Citral, 553
- Llewellyn, J. F.,
Pharmaceutical Chronology, 213
- Lloyd, John Uri,
Biography of John King, 217
Lloyd's Reagent, 625
- Lobeck, A. K.,
Efficiency, 700
- Lyman, Rufus A.,
Modern Medicine, 1175
- Lyon, B. B. Vincent,
Autogenous Vaccines, 721
- Maines, E. L.,
Ash Content of Crude Drugs, 423
Manufacturing Points, 1325
Total Extractive as a Factor, 997

INDEX TO SUBJECTS

A

Acacia, 359
 syrup of, 1575
 Acetum Scillae, 549
 Acid and Alkali V. S., Standardization of, 708
 Acid, citric, 1563
 hydriodic, 1564
 hydrobromic dilute, 1564
 hydrochloric, 1564
 hypophosphorous, assay of, 182, 1564
 nitric, 1564
 phosphoric, 1564
 sulphuric, 1564
 concentrated for tests, 1582
 Aconite—
 root, 359, 670
 assay of, 986
 Address, of Pres. Beringer, 1217
 of chairman, section on Pharmacopœia and
 Formularies, 1298
 of chairman of section on practical phar-
 macy and dispensing, 1309
 of chairman on Historical Pharmacy, 1695
 of president of women's section, 1513
 installation of Pres. Mayo, 1249
 of R. Cadwallader, 1125
 report of committee on president's, 1368
 Adeps—
 benzoin, 1565
 Adjuvant elixir, 1568
 Adrenal gland, 1139
 Adrenalin, pharmacy of, 1547
 Adulterated preparations, the cause of, 500
 Advertising—
 art of writing, 738
 calendars, 1316
 pharmaceutical, 125
 retail drug store, 976
 "What Methods to Employ," 1318
 Agar-Agar, 360
 Agaricus, 434, 873
 Albumen, 873
 Alcresta—alkaloids, 710
 Alkaloid—gelseminine, study of, 314-315
 Almond meal, 856
 Almond, oil sweet, 362
 Alpers, William Charles, 1722
 Aloes, 360, 855
 Althaea, 361
 All Fool's Day,—
 at the dispensing counter, 1537
 Amendment—
 to By-Laws of House of Delegates, 1403
 to Food and Drug regulations, 902
 to Harrison Bill, 479
 to Pharmacy Laws, 55, 196, 333
 Amer. Druggists' Fire Ins. Co., meeting of,
 1750
 Amer. Druggists' Syndicate, convention, 589
 American Institute of Prescriptionists, (The)
 1542
 Am. Medical, education criticised, 297
 American Pharmaceutical Association—
 convention, rates and routes for, 921
 history of, 1625
 honorary pres. of, Geo. Henry Schafer, 1459
 officers elected, 1535
 Pennsylvania in, 1135
 reform measures for, 416
 retailers in, 1688
 sixty-second annual convention of, 1217
 Year Book of, 819
 Ammonia liniment, 550
 Ammonia water—
 method of handling, 506
 Ampoules—
 camphorated oil, 689
 Amyl nitrite, 362, 1327, 1466, 1684
 Analysis—
 of emulsions, 1444
 of prescriptions, 1554
 methods of, 642, 1076

Anise, 362
 oil of, 855, 1105
 Antisepticus, liquor, 507
 Antipyrin—
 tablets, 1087
 Antitoxins—
 and vaccines, 715
 preparations and care of, 858
 Apothecaries Abroad, 1735
 Apparatus in retail pharmacy, 697
 Apple, Franklin M., 1725
 Arnica, 363
 Arny, Harry V., 1725
 Aromatic elixir, 1568
 Arsenic—
 in Fowler's Solution, 645
 test of, 1579
 Art of making a sale, 509
 Asafoetida, 363
 Asclepias, 873
 Ash-content of crude drugs, 423
 determination of, 1078
 Associations—
 Maine, history of, 350
 Massachusetts, State, 1240, 1037
 Medical, American, 65, 1121
 Illinois, 1035
 Kentucky, 1180
 Maryland, 1180
 Missouri, 1181
 Pennsylvania, 1182
 N. A. R. D., 1034, 1474
 National of Boards of Pharmacy, 584
 National of Mfgs. of Medicinal Products,
 587
 National Wholesale Druggists, meeting of,
 1608
 Women's Pharm. of the Pacific Coast, 1343
 Aspidosperma, 1566
 fluid extract, 1569
 Assay—
 alkaloidal, gen. directions, 984
 allyl iso-thiocyanate, 1110
 cinnamic aldehyde, 1107
 citral, 1119
 phenols, 1110
 Atropin sulphate, 1088

B

Balsam, Oregon, 28
 Baptisia, 873
 Beal's, Dr., Resignation, 769
 Beef, wine and iron, 670
 Beeswax, 854
 Belladonna, 365, 366, 492
 alkaloidal content of, 98
 assay of, 987
 emplastrum, 1568
 Benzoin, 366, 855, 1565
 Bergamot—
 oil of, 876
 Berries, blackberry, 874
 raspberry, 874
 horse-nettle, 874
 Bibliography—
 of deterioration of drugs, 38
 of formularies, 959
 Bichloride legislation, 161
 situation, 482
 Biological products, 1100
 business, boosting the, 1319
 Blood Root, 399
 tincture of, 1577
 Book Reviews, 777, 924, 1157
 Branches A. Ph. A., 142, 279, 458, 598, 762,
 891, 1030, 1340, 1484, 1612, 1744
 Brown, Linwood A., 1724
 Buchner, Ludwig Andreas, 83
 Buchu, 367
 Bureau of Standards—
 work of, 1426
 Butternut, 874

C

Cade, oil of, 1106
 Caffaina, alkaloid, 1089
 citrated, 549, 1089
 Calendars as an advertising medium, 1316
 Candy, as a side line, 1314
 Cajuput, oil of, 1106
 Calamine, 856
 Calcium glycerophosphates, 1566
 California, 1915! 880
 Calomel suspension, 965
 Calumba, 367
 Cambogia, 368
 Camphor, a study of, 91
 liniment of, 550
 Camphorated oil—
 apparatus for filling ampoules with, (illus-
 trated), 689
 Cannabis, 368
 Cantharides, 369, 988, 1567
 tincture of, 631, 1576
 Capsicum, 369
 Caramels, preparation of, 495
 Cardamon, 369
 Carum, 370
 oil of, 1106
 Cascara sagrada aromatic, 1569
 Castile soap, 853
 Causerie, 920
 Centenary—
 of men famous in pharmacy, 80
 Ceratum, 1567
 cantharides, 1567
 Chapman, William B., 81
 Chemicals, buying from peddlers, 89
 Chemistry, pharmaceutical, 129
 Chicory, its detection, 1669
 Cinchonidin, 1090
 Cinchona—
 assay of, 989
 flava, 371
 rubra, 372
 tinctures of, 1577
 Chondrus, 371
 Cimicifuga, 371
 Citric acid, 1563
 syrup of, 1576
 Cinnamon, 372, 373
 oil of, 1107
 Clerks—
 how to gain efficiency from, 1449
 City, the convention, (illustrated), 916, 1151
 Clover, 879
 Cloves, 370
 oil of, 1107
 Cobblers, To Your Lasts!! 1609
 Coccus, 373
 Cochineal, 373
 Colocynthis, 374
 Colchicum, 545
 assay of, 990
 extract of, 374, 534, 996
 College Examinations, A Defense, 1718
 Colleges of Pharmacy—
 Massachusetts, 77
 Philadelphia, 78
 Iowa, 1342, 1475
 Illinois, 1342
 St. Louis, 1343
 West Virginia, 1475
 College and Society, 887, 1034, 1179, 1342, 1475,
 1614, 1748
 Collodion, 549
 cantharidal, 550
 flexile, 1567
 Colloids, metal, (illustrated), 799
 their importance, 1004
 Colorimetric methods, (illustrated), 553, 1460
 Commercialism—
 the bugaboo of, 1446
 Committee, local,
 Detroit, its organization, plans and work,
 1456
 Compressed tablets, 31, 820, 937, 1062
 Condurango, 374
 Conference National Food Trades, 584
 National Drug Trade, 590
 minutes of, 744
 Convallaria, 375

Conventions—

American Druggists Syndicate, 589
 N. A. R. D., 1034, 1474
 N. W. D. A., 1608
 Convention, (A. Ph. A.), 1217, 1336, 1353, 1489
 at Detroit, 921
 invitation to, 1143
 dispatch of business at, 1145
 attendance at, 1371
 Co-operation overdoing, 295
 Coriander, 376
 oil of, 1107
 Creosote coal-tar, 856
 Cresol, 1567
 Council business, 157, 287, 471, 611, 761, 905
 1038, 1186, 1343, 1374, 1479, 1614, 1754
 Cubebs, 376
 oil of, 1107
 Cunila Mariana, 33

D

Day, William B., 1336
 Decoctions, 550
 Delegates—
 resolutions from House of, 1401
 accredited to the 62nd annual convention
 1404
 Detroit, the Convention City, 624
 the work of the local committee, 1456
 Delphinium, 873
 Dentists—
 native, in China, 849
 Digitalis—
 activity of, 304
 potency of, 306
 dried, 377
 infusum, 550
 tincture of, 1577
 fluid extract of, 541
 Dioscorea, 874
 Dispensing counter—
 All Fool's Day at, 1537
 Dispensing, difficult things in, 343
 Dispensing doctors, 1321, 1322
 Don'ts in pharmacy, 971
 Dreaming and Doing, 1716
 Drugs—
 ash content of, 423
 better, as well as foods, 1603
 crude, 972
 deterioration of, 38
 habit forming, 1168
 specifications in buying, 851
 Drug plant breeding, 166
 Drug market, effects of the war on, 1533
 Drug store, efficiency in a, 700
 Drug trade, conference, 590, 744

E

Education, medical, criticized, 297
 Elder Flowers, 877
 Electrical science, 1606
 Elixir—
 aromatic, 1568
 adjuvant, 1568
 Emplastrum—
 belladonna, 1568
 cantharides, 1568
 capsicum, 1569
 rosin, 1569
 lead, 1669
 Emulsum, amygdalae, 549
 analysis of, 1444
 asafoetidae, 549
 olei morrhuae, 550
 olei terebinthinae, 550
 Entertainments proposed at Detroit meeting,
 (illustrated), 489
 Ergot, 377
 activity of, (illustrated), 786
 fluid extract of, 541
 method of testing (illustrated), 925
 Eriodictyon, 378
 Ether, 1565
 Ethics, a question of professional, 619
 Eucalyptus, 378
 oil of, 854, 1107
 Euonymus, 379
 Examinations, College, 1718

Exposition, Panama-Pacific International, 449

Extracts—

aconiti pulveratum, 533
 belladonnae foliorum, 533, 534
 cannabis indicae, 534

MORE ABOUT THE HARRISON BILL.*

IN the December number of the JOURNAL, Editor Beal, in his customary interesting and lucid manner, discusses some of the objections made to the present so-called Harrison Bill. If there be any one thing which I regret in this connection, it is my inability to share the views of Dr. Beal on this oft discussed measure. In aid of a clear understanding of these comments, it is suggested that they be read together with the editorial.

First: It will hardly do to say that the National Drug Trade Conference in its draft of the Harrison Bill sought only the means to trace habit-forming drugs to the hands of the distributor, and to avoid interference with the police powers of the several states. The bill as drafted would supervise and control every grain of the narcotics as distributed to consumers by retail druggists, other than preparations containing minimum quantities. To say that the Harrison Bill does not undertake to regulate distribution to the consumer, in the face of a provision under which pharmacists may sell only on physicians' prescriptions, and are required to keep such prescriptions for a term of years, always subject to the control and inspection of Government officials, cannot well be. There are a number of other instances in which the bill would aim at police regulation without showing any connection with the taxing or inter-state commerce power of the Federal Government. The most curious part of it all is, however, found in the fact that the Conference deemed it necessary to ignore its own expressed intent when it came to consider distribution by the retail druggist.

Second: To contend that physicians are not required to register under the bill if they merely prescribe, is hardly correct, for Section II of the bill provides that the pharmacist may fill the prescription *only of physicians who are regis-*

*A reply to "Some Objections to the Harrison Bill" on p. 1498 of the December Journal.

tered under the Act. It will not serve the physician much to have the right to prescribe without being registered, if no one may lawfully fill his prescription. The point, however, is that a physician who does not assume the functions of a pharmacist, and who himself uses the narcotics only for administration by him in cases of emergency, should not be put upon the plane with the dispensing doctor.

Third: It is my opinion that those who have been advocating Federal regulation of the traffic in narcotics, have had in mind largely the inefficiency of the state laws, and the inefficiency of their enforcement. It is, therefore, aside of the question to say, that if state laws are inefficient, or if local authorities are lax in their enforcement, that then the interest of the Harrison Bill will be largely nullified. Those who have advocated proper Federal legislation, have sought something which would be effective in spite of the inefficient state laws, and the lax enforcement by local authorities.

Fourth: Of course, it is no hardship to require the pharmacist to preserve his prescriptions. This is not the point. The pharmacist is required to preserve them *as a record, and must keep them open for inspection and supervision.* If such a requirement for record, inspection and supervision is deemed essential from the pharmacist, then, why is it not essential for the man who as a dispensing physician assumes the function of a pharmacist? There can be only one sound reason advanced for the differentiation, and this would have to be based on the claim that the wrong doers are all in the ranks of pharmacy, and not in the ranks of the dispensing physician.

Fifth: It is difficult to understand why it would be unjust to require the dispensing physician to write a prescription for the narcotics which he would dispense, and then to keep such prescription as a record open for inspection and supervision, just as the pharmacist is required to do. If the dispensing physician assumes to act in a dual capacity, why should he not be required to comply with the requirements which are incident to each of said capacities? Of course, if the dispensing physician does not know how to write a prescription, it may be a little hard on him, but then, in the cause of humanity, it is high time that he learn. Incidentally, he might then learn to write other prescriptions. The requirement is not intended to be that some third person write the prescription for the dispensing physician. He is to write it himself, and thus establish the written record for inspection, just as the pharmacist is required to do.

Sixth: While it is true that inequality in the operation of the laws between the pharmacist and the physician gives some ground for questioning the constitutionality, this is not at all the only reason advanced. The important grounds upon which the constitutionality of the Harrison Bill is questioned are

(a) That it discriminates between those who are required to pay the same tax. A manufacturer and a wholesaler, who pay the tax and who are not pharmacists (created by state law) may not sell to the consumer, while the pharmacist may sell to the consumer and act also as a manufacturer and sell at wholesale. That the pharmacist is permitted to do this, is of itself no cause for complaint on the part of the writer, but under the law it produces such inequality and discrimination as to seriously affect the constitutionality of the bill. This

is said with full knowledge, that uniformity as specifically required by the Federal Constitution, has been decided to mean geographical uniformity, but aside from this, it is the first essential of every act to give the same rights to those who are required to pay the tax.

(b) Sub-Section (a) and (b) of Section II, are purely an exercise of the police power, without showing any connection whatever with either the taxing power or the interstate commerce power. If these provisions are not shown to be an incident to either the taxing power or the interstate commerce power of the Federal Government, then the Government has no authority to enact them.

If these two Sub-Sections are held unconstitutional, they do not merely affect some minor provisions, but do affect the constitutionality of the entire act, and they can be changed, if the dispensing physician is not exempted, to meet constitutional objection.

Seventh: In deciding upon the constitutionality of the Act, the Court could not take into consideration that the druggist has no business to sell habit-forming drugs direct to the general public. It would have to recognize, that in and of itself, such is not properly a concern of the Federal Government. The example sought to be cited of inequality between the druggist who buys a barrel of alcoholic liquor and sells it as such, and the druggist who buys a barrel of alcoholic liquor and uses it to make real medicines, and then sells it, is hardly an analogy. In the one case the druggist sells liquor and in the other he sells medicines. The druggist who sells liquor has exactly the same right as has the druggist who sells medicines, and if he does not sell his barrel of alcoholic liquor as such, then he is not required to pay the retail liquor dealer's tax.

Eighth: It has not become known to me, that any one has advocated that the dispensing physician should be required to demand of his patient that he register as a dealer. The thing that has been advocated is, that the dispensing physician make and keep exactly the same kind of a record as the pharmacist is intended to keep. If there be any absurdity in this, it can be found only in the mind of one who would favor the dispensing physician acting as a pharmacist, as against the pharmacist acting as a pharmacist. The question is not with reference to the administration of a dose by the physician to the patient, it is with reference to the physician who would dispense to his patient a quantity of narcotics for subsequent use.

Ninth: To claim that permission to the dispensing physician to distribute narcotics *only in the course of his professional practice*, is a safeguard against the abuse of the privilege is rather farfetched and not borne out by past experience. The latitude which of necessity would need to be given every physician is sufficient to cover most every possible abuse. To say that the danger of a \$2000.00 fine, in making use of the order blank to obtain the drugs for any other but a lawful business, would prevent abuse by the physician hardly serves to sustain the point which is sought to be made, for so long as it rests in the discretion of the physician to claim that he has dispensed the drug in the legitimate practice of his profession, it also rests with him to claim that it was a lawful business. To say that, if the exception and discrimination made in the bill in favor of the dispensing physician transfers to him all of the illegitimate traffic

in narcotic drugs, this should be a source of congratulation on the part of the pharmacist, is entirely aside of the point involved. Those who have sincerely and actively been advocating proper Federal regulation, which should include the Drug Trade Conference, have been interested and engaged in this effort for the purpose of securing efficient regulation which would curb the narcotic evil for the common welfare of all, not for the purpose of giving one class of men an opportunity to proudly strike their chests proclaiming that the evil doers are not among them. To the person who is interested in preventing illegitimate traffic in narcotics, it can be but of small satisfaction to know that his effort has succeeded only in transferring part of the traffic from one class entirely to another class. Of course, there is nothing in the bill which would restrict further state legislation. It is, however, the opinion of many, and more than likely the opinion of those who first agitated proper Federal regulation, that state legislation, no matter how thorough and complete, would always fail because of insufficient enforcement by the state authorities.

Tenth: There must be error in the claim, that the phrase "Registered Under This Act" was carried over from several earlier forms of the bill, for the writer has industriously studied such earlier forms of the bill and has not found the phrase *in connection with the subject matter* in which it is found in the present Harrison Bill. To impose upon the pharmacist under a penalty of \$2000.00 and five years' imprisonment the duty to know that a prescription which he would fill is written by a physician who is registered as a dealer in narcotics, is certainly going just a little beyond sound reason. That those who are responsible for this provision did not really intend it, must be granted by any fair-minded man, but that it continues to be defended after being pointed out, is to be regretted. It certainly would be far more in keeping with the sound judgment of those who are responsible for it, had they graciously said "It is an error and we will see that it is corrected."

In making these comments it has been my purpose to touch only upon the more important features of the editorial in question. It, however, may not be out of place to say that, I cannot believe that Congress will ever stultify itself by enacting into law that so-called Harrison Bill in its present form. So long as certain special interests seek advantages and exceptions, the difficult problem of securing proper effective and enforceable legislation will not be solved, unless those who are entrusted with the task decide that all shall be treated with equal fairness, and none with special favor. As soon as this can be agreed to, the inherent difficulties will become far less difficult.

FRANK H. FREERICKS.

THE EDITOR'S REPLY TO MR. FREERICKS.

WHEN the discussion of so technical a matter as is involved in the Harrison Bill is unduly prolonged there is always danger that it may become a mere exercise in verbal dialectics, and what was intended as serious debate degenerate into fruitless quibbling over words and definitions.

While desirous of avoiding responsibility for such a result in the present in-

stance, the Editor feels that circumstances require him to make some reply to the very interesting comments submitted by Mr. Freericks in the preceding paper. For convenience of reference, the several sections of this reply are numbered to correspond to the sections of Mr. Freericks' argument to which they refer.

First. The Harrison Bill does not propose to interfere in the police regulations of a state any further than is necessary to insure the collection of the tax levied. The tax is laid upon the handling of certain drugs by dealers, and having power to levy the tax the Congress has also power to adopt such regulations as will insure its collection from those who should pay it, even though these incidental regulations operate wholly within a state.

The tax is not levied upon the purchase of the drugs for consumption, but upon the business of dealing in such drugs, and dealing in them includes both a purchase and a resale, either to a customer or to a patient.

In order to distinguish between those who are dealers and those who are not, the former are required to register and use an official order blank for their purchases of the drugs. The production of the order blank is legal evidence of their having registered and paid the tax.

The physician's patient, however, is not a dealer and not liable for the payment of any tax, and the bill simply provides that the physician's prescription shall be sufficient evidence to the seller that the drug is intended for consumption and not for resale. The requiring of order blanks and prescriptions is not an interference with the state's police powers, but only the requiring of evidence of certain facts: in the case of the order blank that the dealer has paid the tax; in the case of the prescription that the drug is required for consumption, for which no tax is necessary.

Second. The editorial which Mr. Freericks reviews stated plainly that the practical effect of the Act would be to require all physicians to register as dealers, whether they were of the class commonly known as dispensing physicians or not. As this point was not in controversy it did not seem to the Editor to be necessary to point out all of the reasons why every physician would be compelled to register.

Third. No doubt the advocates of Federal regulation of the traffic in habit-forming drugs had it in mind to supplement state laws and to make their efficient enforcement possible. There is no dispute on this point. It has been the constant claim of those who helped to formulate the Harrison Bill that this was the objective at which they aimed.

To advocate, however, that Federal legislation should be such as will effectually control the traffic irrespective of state laws and their efficient enforcement is to advocate the impossible. To do so would necessitate a far greater interference with the state's exclusive jurisdiction in police affairs than is involved in the most extreme proposition of the Harrison Bill. If the traffic in habit-forming drugs is to be touched at all through Federal law, it must be either through the expressed power of Congress to regulate interstate commerce, or through its power to levy taxes, and its implied power to make these regulations effective, even though they do incidentally affect the police powers of the state.

Fourth. The pharmacist may dispense either on an order blank or on a prescription. The first is preserved as a record to show that the drug was sold to a

dealer who has paid the tax, the second that the sale was to a consumer who is not required to pay the tax. If the physician, acting as a dealer, sells to one not his own proper patient he would have to preserve the same record as the pharmacist.

Fifth. To require that the physician write a prescription for what he dispenses, and then *himself keep the prescription*, as suggested by Mr. Freericks, would be fruitless, if not worse. It would cause the law-abiding physician some additional trouble, and would give the dope dispensing doctor something he would very much like to have, namely, the authority to manufacture evidence at will to cover his nefarious practice. When a physician has so far lost his sense of professional responsibility as to be willing to sell habit-forming drugs to habitues, a little thing like writing a fake prescription is not going to burden his conscience, especially when the law by recognizing his right to do so would make it still more difficult for the state officers to prove that the substance had been improperly dispensed.

He could write a prescription for a grain and deliver an ounce, or any other quantity, and the patient, if a "fiend" or one who is obtaining the drug for surreptitious sale to others, would do anything necessary to keep the doctor out of trouble, and thus preserve his source of supply unimpaired.

If the proposition was that the physician when he dispenses should deliver a prescription to a *third* party, who had the means of knowing that the amount delivered corresponded to the prescription, (as is the case when the pharmacist fills it) then it might prove effective; but such a proposition is not under discussion.

Sixth. To the objection that the law would discriminate between the wholesaler and manufacturer on the one hand and the retailer on the other in that it would require all to pay the tax, while only the latter, (i. e., the pharmacist registered under state law) could dispense on prescription would constitute such an inequality as to make the law invalid, it may be replied that wholesalers and manufacturers, acting as such, do not compound prescriptions for patients.

The bill does not divide dealers into wholesalers, retailers, etc. It classes them all as "dealers," and does not discriminate as to the amounts they may sell or the persons to whom they may sell. That the state law would permit some dealers to fill prescriptions and deny the privilege to some others is an incidental matter with which the Federal law would have nothing to do.

If any dealer, whether wholesaler, retailer, or physician, sells to another dealer, he must have an order blank to show that the purchasing dealer has paid the tax. If the dealer dispenses on a prescription, the latter is recognized as sufficient evidence that the sale was to a consumer who is not liable for the tax. If the state law permits wholesalers to fill prescriptions, these prescriptions would be accepted the same as those of the retailer.

The same reply applies to the objections that exceptions (a) and (b) constitute an invasion of the state's exclusive right to police powers.

These exceptions do not change the liabilities of the physician or other dealers to register and pay the tax. They only relieve the patients from the necessity of presenting an order blank to the physician or pharmacist before they can ob-

tain the medicine. If the drug is dispensed by a physician, dentist, or veterinarian when they shall personally attend upon such patient, this is accepted as sufficient evidence that the drug is for consumption and not for resale, and consequently that the person who gets it is not liable for the tax. The physicians's prescription when filled by the pharmacist is accepted as evidence of the same fact.

They are properly incidental to the exercise of the taxing power, since they relate to evidence regarding payment or non-payment of the tax. The fact that the law chooses to accept such evidence as sufficient to show that the sale is to a consumer who is not required to pay a tax could not, in the writer's opinion, be construed as an undue invasion of the state's police powers.

Seventh. In passing upon the constitutionality of an act, a court would most certainly take into consideration the rights of the party claiming relief. The claimant could not attack the validity of an act except by pleading that it abridged some of his rights under the Constitution. Unless his constitutional rights are abridged, he has nothing to plead, and consequently no standing in court.

The case cited of the difference in the burden placed upon the sale of alcoholic liquors for beverage purposes, and their sale when used as the constituents of a medicine is exactly in point. The tax is levied upon the traffic in alcoholic liquors for the purpose of raising revenue, but the law recognizes that the sale in the one case may be opposed to the public welfare and in the other case in aid of it, and hence places the tax upon the one and not upon the other.

The Harrison Bill does not go even so far as this. It requires the tax from every dealer alike, whether sold for the purpose of a medicine or for ministering to a previous habit.

All that exceptions (a) and (b) amount to, *when viewed in their true light*, is to relieve the consumer (i. e., the patient) from the necessity of registering as a dealer—which he is not—and using an order blank upon which to obtain the medicine which his condition requires.

Eighth. The writer is a pharmacist, his sympathies are with the pharmacist, and he yields to no one in his readiness to defend every moral and constitutional right that the latter is entitled to, but he denies that the bill would invade any such rights.

If the bill proposes an inequality of obligation as between the physician and the pharmacist it can be removed only by increasing the obligations of the former or by decreasing those of the latter. As to the futility of increasing the obligation of the physician by requiring him to preserve his own record without supervision or control by a third party the writer has already expressed himself, and will not repeat the argument.

When it comes to reducing the obligations placed upon the pharmacist by the bill, the writer claims that the requirements are already as light as they should be. The pharmacist's moral and professional obligations, and in many cases the state laws require that he dispense these drugs, (when in such form and quantity as to create or foster a habit) only on a physician's prescription. The bill requires no more than this, and hence does not increase the burden which is now imposed upon him both by moral and by state law.

Ninth. The dope dispensing doctor might "claim" that he dispensed the drugs in the conduct of a lawful business and in the course of the legitimate practice of medicine, but when confronted by a Federal court and jury he would discover that there is a vast difference between "claiming" and proving.

Tenth. There was no error in stating that the phrase "registered under this act" was introduced into one of the earlier forms of the bill. The Bill known as H. R. 28277, introduced January 20, 1913, after the first Drug Trade Conference, contains on page 9 the following: "That nothing contained in this section shall apply to the delivery of prescriptions of physicians, dentists and veterinarians duly registered under this act, compounded by a person duly registered under this act."

It is beside the point to say that it was not "used in the same connection as in the present bill." The first bill was a regulation of interstate commerce; the present one is a tax measure, and consequently the connection could not be the same. The intent of the phrase in both bills, however, was the same, namely, to give to drugs when dispensed on physician's prescriptions a different status under the law than when dispensed without a prescription.

As stated in the editorial, the writer considers the danger of harm to the druggist from filling the prescriptions of unregistered physicians as rather remote. As the bill will compel every physician to register as a dealer, even if he dispenses only on emergency, as all must do sometimes, there is not one in a thousand who will risk the penalties of the law by not doing so. If objection had been made to the phrase before the National Drug Trade Conference adjourned it is likely that it would have been eliminated, not because of any particular danger due to its presence, but from a desire to make the bill as satisfactory to as many persons as possible.

That Congress will not pass the bill in exactly its present form is quite probable. It would be equally safe to prophesy that Congress will never pass any other bill of equal length and importance without making changes in its phraseology as introduced.

J. H. BEAL.

BRIGHTER PROSPECTS FOR PRICE PROTECTION.

WHEN the retail druggist stood alone, as until recently he did, in asking for the maintenance of the advertised retail prices on proprietary articles the rate of progress toward the legal and public recognition of his claim was slow, and at times the movement has even seemed to be in the reverse direction.

This ill success has been due to the world-wide and almost world-old popular belief, or more properly superstition, that there is an enormous profit in the sale of drugs, and the contest between the aggressive cutter and his fellows has generally been regarded as a dispute between robbers over their ill gotten gains, or if any sympathy was aroused it was betowed upon the cutter, who was looked upon as being, partially at least, in favor of giving the public a square deal.

When the druggist attempted to tell his customers that his average net profits were even less than those of some other retailers, he was met with polite incredul-

ity or flat unbelief. Nor has this prejudice been confined alone to those whose opportunities for impartial observation might be presumed to be limited, but it was extended to those who might be presumed to know better. On several occasions when the writer has called the attention of his friends in the newspaper fraternity to the well considered and carefully prepared articles by Mr. Harry B. Mason on drug store profits, while he was listened to politely enough it was easy to see that his hearers were inclined to believe that Mr. Mason had somehow juggled the figures so as to make out a better case for the druggist than the facts warranted. If the newspaper man condescended to argue the case it was usually to point to the success of those who extensively advertised themselves as cutters, and yet were able to conduct several flourishing stores, and by their scale of living exhibit all of the external evidences of financial prosperity.

If it was objected that these notorious cutters cut the prices of advertised proprietaries merely to create a reputation for cheapness, and relied for their profits upon the sale of their own make of substitutes for the advertised goods and by boosting the margins on goods the prices of which were not advertised, it was thought sufficient to reply that the average retailer ought to adopt the same policy and thus reap some of the prosperity that goes to the aggressive cutter.

In other words, the druggist's reputation as a taker of exorbitant profits is too deeply ingrained in the mind of the average man to be overcome either by evidence or argument to the contrary.

When, however, patented razors and cameras, copyrighted books, package groceries, and dozens of other articles widely advertised to sell at specified prices were seized upon by department stores and others to use in the same way they had used proprietary medicines—by advertising them at cut prices to draw people into their stores, and recoup themselves by the sale of more profitable articles,—then the regular dealers in these goods began to understand that the cause of the retail druggist was, after all, the cause of the square deal and fair play. The great difficulty has been, and still is, to reach and convince the purchasing public which, having only partial knowledge, has been persuaded that it has been profited by the price cutters.

Until one or two years ago, the task of reaching and instructing public sentiment seemed almost hopeless, but within that period there has appeared evidence, the volume of which is daily increasing, to show that the public conscience is at last beginning to be aroused to the economic and moral evils of price cutting upon fixed price goods, and is beginning to seriously consider legislation designed to prevent so-called competition from being used as an instrument for the destruction of real competition which always results when the independent small dealers are driven from the field.

The drug trade can now congratulate itself that its own members have done not a little to inaugurate the reform, and have secured through judicial decisions, not only a clear definition of the questions at issue, but also some clean-cut arguments in support of the principle of price maintenance, as in the case of the Miles Medical Co. vs. Park and Sons, in which Justice Holmes, in his dissenting opinion says:

"I cannot believe that in the long run the public will profit by this course, permitting knaves to cut reasonable prices for mere ulterior purposes of their own,

and thus to impair, if not destroy, the production and the sale of articles which it is assumed to be desirable the people should be able to get."

Since then the movement for adequate and proper price maintenance has received an important impetus by the organization and activities of the American Fair Trade League, which has enlisted the interests and co-operation of prominent publicists in their propaganda. One of the most notable of the recent utterances upon the subject is found in an article on "Cutthroat Prices," by Louis D. Brandeis, in a recent number of *Harper's Weekly*. In drawing a distinction between price maintenance and price fixing Mr. Brandeis uses the following argument:

"The independent producer of an article which bears his name or trade-mark—be he manufacturer or grower—seeks no special privilege when he makes contracts to prevent retailers from cutting his established price. The producer says in effect: 'That which I create, in which I embody my experience, to which I give my reputation, is my property. By my own effort I have created a product valuable not only to myself, but to the consumer; for I have endowed this specific article with qualities which the consumer desires, and which the consumer should be able to rely confidently upon receiving when he purchases my article in the original package. To be able to buy my article with the assurance that it possesses the desired qualities, is quite as much of value to the consumer who purchases it, as it is of value to the maker who is seeking to find customers for it. It is essential that the consumer should have confidence not only in the quality of my product, but in the fairness of the price he pays. And to accomplish a proper and adequate distribution of product guaranteed both as to quality and price, I must provide by contract against the retail price being cut.'

"The position of the independent producer who establishes the price at which his own trade-marked article shall be sold to the consumer must not be confused with that of a combination or trust which, controlling the market, fixes the price of a staple article. The independent producer is engaged in a business open to competition. He establishes his price at his peril—the peril that if he sets it too high, either the consumer will not buy or, if the article is, nevertheless, popular, the high profits will invite even more competition. The consumer who pays the price established by an independent producer in a competitive line of business does so voluntarily; he pays the price asked, because he deems the article worth that price as compared with the cost of other competing articles. But when a trust fixes, through its monopoly power, the price of a staple article in common use, the consumer does not pay the price voluntarily. He pays under compulsion. There being no competitor he must pay the price fixed by the trust or be deprived of the use of the article."

In pointing out how, under the disguise of open competition, price cutting may become the most effective instrument in the creation and maintenance of monopoly, Mr. Brandeis presents the following cogent thoughts:

"The competition attained by prohibiting the producer of a trade-marked article from maintaining his established price offers nothing substantial. Such competition is superficial merely. It is sporadic, temporary, delusive. It fails to protect the public where protection is needed. It is powerless to prevent the trust from fixing extortionate prices for its product. The great corporation with ample capital, a perfected organization and a large volume of business, can establish its own agencies or sell direct to the consumer, and is in no danger of having its business destroyed by price-cutting among retailers. But the prohibition of price-maintenance imposes upon the small and independent producers a serious handi-

cap. Some avenue of escape must be sought by them; and it may be found in combination. Independent manufacturers without the capital or the volume of business requisite for engaging alone in the retail trade, will be apt to combine with existing chains of stores, or to join with other manufacturers similarly situated in establishing new chains of retail stores through which to market their products direct to the consumer. The process of exterminating the small independent retailer already hard pressed by capitalistic combinations—the mail-order houses, existing chains of stores, and the large department stores—would be greatly accelerated by such a movement. Already the displacement of the small independent business man by the huge corporation with its myriad of employees, its absentee ownership, and its financier control, presents a grave danger to our democracy. The social loss is great; and there is no economic gain. But the process of capitalizing free Americans is not an inevitable one. It is not even in accord with the natural law of business. It is largely the result of unwise, man-made, privilege-creating law, which has stimulated existing tendencies to inequality instead of discouraging them. Shall we, under the guise of protecting competition, further foster monopoly by creating immunity for the price-cutters?"

And, finally, this very remarkable paper is closed with the following stirring appeal to the common sense and spirit of fair play of the American people:

"Americans should be under no illusions as to the value or effect of price-cutting. It has been the most potent weapon of monopoly—a means of killing the small rival to which the great trusts have resorted most frequently. It is so simple, so effective. Far-seeing organized capital secures by this means the co-operation of the short-sighted unorganized consumer to his own undoing. Thoughtless or weak, he yields to the temptation of trifling immediate gain; and selling his birthright for a mess of pottage, becomes himself an instrument of monopoly."

That the leaven is spreading is also apparent from the fact that many other independent and non-partisan journals of national circulation are beginning to quote with approval the arguments of the price protection advocates, as for example, the following which is quoted from the editorial columns of the *Saturday Evening Post*:

"Thoroughgoing followers of Adam Smith held that competition would cure everything. Give competition free sway and goods would be sold at the lowest possible price because manufacturers would bid against one another for customers; wages would be as high as possible because manufacturers would bid against one another for labor; goods would be of the best quality because such goods would attract the most buyers.

"Nobody, we suppose, believes that now. Experience contradicts it on every hand. Everyone who reads the newspapers sees that competition, instead of curing all evils, creates many. The Standard Oil Company was a perfect fruit of unlimited competition—being simply the competitor that survived and beat all others in a completely untrammelled field.

"Banks, railroads, insurance companies, meat packers, food manufacturers, and others, are restrained by law from competing in certain ways. It is said now that we want fair competition—which always means limited and restrained competition.

"The big thing before the forthcoming session of Congress will be the Administration's trust policy; and the big question concerning that policy is as to how much it will insist merely on competition.

"President Wilson has already signed a bill containing an exemption which im-

plies that monopolistic co-operation may be very beneficial for labor and for agricultural products, even with no supervision on behalf of the public. That is a pretty plain acknowledgment that competition is no cure-all."

Additional encouragement is found in the fact that politicians in search of popular issues are also beginning to see the light, as is witnessed by the recent report of a newspaper interview with Secretary McAdoo, who as a member of the President's official family may be expected to be in accord with the policy of the present administration:

"How would you regulate monopoly?" I inquired.

"I do not believe you can successfully regulate monopoly by permitting it to exist and by then passing laws to control it. Some men advocate this, prominently among whom is Mr. George W. Perkins. There are others equally as conspicuous. The only way to regulate monopoly successfully is to prevent it. I believe in prevention. What we ought to do is to regulate competition. By that I mean that we should pass such legislation as will preserve the virtues of competition and destroy its brutalities."

"Brutalities?" I interrupted.

"Yes, brutalities. Competition is full of them, but they are not half so great an evil as the brutalities of monopoly. Let me give you an instance of what I mean by the brutalities of competition. Suppose you own an oil refinery in Indiana and are doing a sound and profitable business in your own zone, which let us say, extends within radius of 200 miles from your establishment.

"Now, suppose that the Standard Oil Company, which has business throughout the United States, invades your territory and finds that you are in its way. It cuts the price of oil below the cost of production and drives you out of business. That is what I call one of the brutalities of competition.

"The Standard Oil Company would lose money in your territory while the fight was going on, but it could increase its price in other parts of the country, where it had a monopoly, and reimburse itself for these losses it was meeting in your territory. After it had driven you out of business it could put up the price in your territory and recoup again what it spent in disposing of you as a competitor.

"It should be made unlawful for a corporation to engage in this kind of practice. It is harmful in every respect, injurious to the public interest, and destructive to proper business standards and ethics. To my mind it is one of the most interesting economic problems of the day, and I have no doubt that it will receive attention by Congress when the whole question of trusts and monopolies is again considered."

In this connection also the writer takes the liberty of quoting from an article by J. Leyden White in a late issue of the *N. A. R. D. Journal*, in which it is shown in a convincing way that the battle for fair prices is not a struggle for special privileges to the retailer, but only an attempt to secure for him equality of commercial opportunity under the law, so that what are now special privileges enjoyed by the few may be converted into general privileges open to all alike. Mr. White says:

"The farmers who originate it, the producers, the growers, demand that they shall have a right to combine for selling purposes, for the price-fixing of corn, simply to protect themselves from their cut-rate competitors, the brokers. In this demand they are solidly backed by all union labor, by all country dwellers who have to do with them, even by country druggists. So powerful is this demand of the right to combine to preserve the farmer's profits on corn (and other products) that the General Deficiency Bill that recently became a law, in so far as that bill could, exempted farmers from the operation of the Sherman anti-trust law.

"The railroad men who take the corn from the farmers are unionized. So are the steamboat men, the longshoremen, freight handlers of all classes, the elevator men, the teamsters and all other labor concerned with its transportation. To defend itself against the cutters that menace it, every element of this labor demands the right to fix its own profits, its wages. This right to defend itself against the cutters whom it call 'scabs' is now generally acknowledged. As the corn goes into a manufactured article, let us say corn flakes, every element of labor, including even the printers of its advertising matter, has the power to combine, and does combine to fix, and does fix its own profit on the corn, by fixing its own wage.

"And did you ever hear of any association of jobbers or manufacturers being afraid to meet organized labor to fix prices, profits, wages, on anything with which labor is concerned? Ever hear them use the Sherman law spook on wage earners as they do on retailers?

"In the various sales of the corn, from the farm to the consumer, every price, every profit is fixed by combination. Brokers, elevator men, commission men, millers, bakers, manufacturers, all fix their profits on corn in their exchanges, boards, of trade, milling associations, and so forth. True, some of them are called 'trusts,' some are said to violate that Sherman spook, but as far as actual stoppage of any of their price-fixing is concerned—it's a joke.

"I said that every price, every wage, every profit is fixed. As a matter of fact, within or without the law, and with the favor of the actual majority of American citizens, every profit coming from the corn, from planter to eater, is practically, although not entirely satisfactorily fixed by the people making the profit, *except in one case.*

"The retail grocers who sell the canned corn or the corn flakes are not allowed to fix their wages, their profits. There the chain breaks, there is the missing link!

"The labor union of girls who fill the boxes with corn flakes can meet their employers, demand a meeting and fix their profit, their wage, and neither public sentiment nor law says nay. But let the same manufacturer dare to meet with retail grocers to fix their profits, their wages, and lo, and behold, the majesty of the law, the power of Government steps in—and keeps the chain from being consistently linked up."

The question is no longer one for academic discussion by trade associations, but has become one of practical politics, and the contest for fair and honest competition has been transferred from the courts to the floors of the state and national legislative bodies.

The cause of the retailer is so just and reasonable that it needs only to be presented clearly and forcibly in order to win legislative approval. It is now up to the retailers of every class to see to it that those who make the laws are fully informed on the subject, and duly impressed with the earnestness and political force of those who make the law makers.

J. H. BEAL.

THE PRESENT STATUS OF THE HUGHES-BACON BILL.

THE annual report of the Surgeon General to the Secretary of War makes a strong plea for the increase and improvement of the status of the Army Hospital Corps. This report has just been published. We quote from it the following:

"I can not in transmitting this, my last, annual report fail to call your attention to one particular in which the Medical Department is unprepared to fulfill its responsibilities to the Army and the Nation. It is one which has been the sub-

ject of frequent communications from this office in the last few years and has been pointed out for several years in the annual reports—this is the great deficiency in number of the Hospital Corps; so that when the tactical divisions of the Regular Army take the field they can have not more than one-fourth of the sanitary units required for the medical service and called for by the Field Service Regulations. In fact the first division stationed in the Eastern Department has not a single sanitary unit. No action by Congress is necessary to remedy this defect, since Congress, in order that such deficiency might be avoided, has placed in the hands of the President the responsibility for providing a sufficiently numerous Hospital Corps to care for the sick and wounded, and has specifically stated that they shall not be counted as a part of the strength of the Army. It is believed that Congress has thus shown the intention that our Army shall have an adequate medical service proportioned to its strength, and this is what I have repeatedly urged. It is also believed that if the Secretary would recommend to Congress the reorganization of the Hospital Corps, which is asked for in this report, it will be easily obtained and will much facilitate the recruitment of suitable men for this relatively unattractive service.

"The authorized strength of the Hospital Corps is as follows:

Sergeants, first-class	300
Sergeants	362
Corporals	50
Private, first-class and privates	2800
Total	3512

"The number of sergeants, first-class, is fixed by law, the total strength of the Hospital Corps and number in the various other grades is determined by Executive order.

"In service June 30, 1913

Sergeants, first-class	295
Sergeants	336
Corporals	38
Acting cooks	190
Privates, first-class and privates	2560
Total	3419

"It will be observed that the Hospital Corps is over $2\frac{1}{2}$ percent. below its authorized strength. It has been found impossible to keep this corps at its normal strength by enlistments, or by voluntary transfer from the line. On four occasions during the year requests have been made to the Adjutant General for the transfer of unassigned recruits from the various depots to fill vacancies, and these requests have been complied with in so far as practicable. About 225 men have been transferred to the corps as a result of this policy. It has not resulted, however, in obtaining the most desirable class of men for service with the sick.

"The authorized strength of the Hospital Corps (3,512) is inadequate for the needs of the service, and does not provide the number of men prescribed by Army Regulations for duty with the Army as now constituted. When the allowance of 3,500 men was fixed for the Hospital Corps, the strength of the Army was less than 76,000. Its present authorized strength, exclusive of Hospital Corps and Philippine Scouts, is about 84,810, and a corresponding increase in the Hospital Corps would bring that organization up to 3905.

"As previously stated in this report, it has been impossible to keep the Hospital Corps filled up to its authorized strength by enlistment and reenlistment, and there has been a constant drain upon it by the transfer of desirable men to

the line and to other staff corps. This is interpreted to mean that the relative desirability of service in the Hospital Corps has lessened since the organization of the corps.

"In his annual report for the fiscal year 1911-12, the commanding general, Central Division, alludes to this condition of affairs in the following terms: 'The discipline and work of the Hospital Corps has been excellent. There has been some difficulty in keeping the detachments up to their authorized maximum strength, as the Hospital Corps does not offer sufficient inducements to make men desire to transfer to it from the line.'

"When the Hospital Corps was organized in 1887, it was recognized that its members would be required to do work that was not attractive to enlisted men and which required special qualifications. To secure a suitable class of men to do such work, non-commissioned officers of the Hospital Corps were given pay considerably in excess of most non-commissioned officers of the line. At a later date the pay of privates was likewise proportionately increased. This principle was lost sight of in the legislation of 1908, when the pay of the line was increased. In the meantime special grades of non-commissioned officers have been made in other branches of the service and various ratings established whereby the opportunities for promotion of intelligent men have been increased and opportunities for a substantial increase of pay have been provided. Opportunities for extra-duty pay are provided in other branches of the service, but are denied to Hospital Corps soldier.

"Bills are now pending in Congress which provide the following grades and rates of pay for the Hospital Corps: Sergeants major (new grade) 30, at \$75 per month, with the increased pay for service as now authorized for sergeants, first-class; sergeants, first-class, 300, pay to be increased from \$50 to \$65 per month; sergeants, pay to be increased from \$30 to \$36 per month; corporals, \$24 per month, (no increase); privates, first-class, pay to be increased from \$18 to \$21 per month; privates, \$16 per month, (no increase.)

"These bills were proposed and introduced without any prompting on the part of this office, but are in accordance with its ideas, and it is believed that if the measure were given the support of the Secretary of War it would become a law.

"Such a law would undoubtedly be for the benefit of the service by increasing the desirability of the Hospital Corps and attracting thereto a better class of men; and the additional higher grade contemplated would provide a more adequate compensation for a limited number of specially skilled men, such as pharmacists of exceptional ability, X-ray experts, anesthetists, and others of a class who can now command in civil life a higher rate of pay than is afforded them in the service.

"In consideration of the special functions of the mobile organizations, there is required for duty with them a certain number of men having qualifications different from those generally required for Hospital Corps soldiers. I therefore recommend that there be allowed for each ambulance company 1 horseshoer at \$30 per month, and 1 farrier, 1 saddler, and 15 wagoners, each at \$21 per month." and for each field hospital 1 artificer and 8 wagoners, each at \$21 per month."

In explanation of the last paragraph it should be said that the Army organization provides field service, hospitals and ambulance companies which have as important accessories, ambulances and other wagons with the necessary horses and mules. Organizations of the line provided with similar transportation, have farriers, horseshoers, wagoners, etc., who receive higher rates of pay than the privates. We believe that members of the Hospital Corps who perform similar duties with our field organizations should receive similar rates of pay. It is our

intention to make provision for these in the Hughes-Bacon Bill as reintroduced at the regular session of Congress and our committee is working toward that end.

In this connection it is of interest to quote from the annual Report of the Brigadier General Tasker H. Bliss, U. S. Army, Commanding the Southern Department:

"The condition of the Hospital Corps at the present time is a matter of very serious concern. The number of men present for duty is altogether too small to permit the efficient performance of the work that regulations, orders and customs of the service seem to require to be done. The service is so arduous for the really good men, and so unattractive, and the pay is so small that the application for transfer to the Corps of a superior man is now an extremely rare occurrence. There are very few applications for authority to re-enlist, while there is a constant depletion due to desertions and discharges.

"The medical and sanitary service could be performed in a much more satisfactory and creditable manner than at present were the hospital quota increased by fifty percent. and its quality could be improved by offering a larger stipend."

Our committee scarcely expected any action at the special session of Congress recently closed, fully realizing that the tariff and currency legislation would preclude the consideration of our bills. We have promise of a hearing early in the present regular session and we urge upon all pharmacists the importance of calling the attention of their representatives in Congress both Senators and Representatives to the national importance of the Hughes-Bacon Bills as bearing upon the efficiency of our Army and the need for the prompt passage of this legislation.

W. B. DAY...

Scientific Section

Papers Presented at the Sixty-First Annual Convention

THE PHARMACOGNOSY MUSEUM.

E. N. GATHERCOAL, CHICAGO.

A museum, according to Webster, is a collection of natural, scientific or literary curiosities. The object of a museum, according to the above definition, would be to arouse and satisfy curiosity, and such is the prime object of all museums. However, the term museum has taken on a broader meaning so as to include among its functions the opportunity for instruction and research, the preservation of historical material and of such articles as are rare in nature and commerce.

Pharmacognosy in a broad sense is the scientific treating of the physical characteristics of medicinal substances, therefore a pharmacognosy museum may be defined as a collection of such natural, scientific and literary articles as are medicinal substances or relate to the same, said collection being designed to arouse and satisfy curiosity, to instruct and give opportunity for research, to preserve rare and historical material. In the most restricted sense, however, pharmacognosy considers only crude animal and vegetable drugs and under this definition only such drugs are included in the pharmacognosy museum. Within these limits every curator of such a museum places his own definition upon the term.

The object of this paper is to present more or less comprehensive answers to the following questions:

(1) What is the value of a pharmacognosy museum to the college of pharmacy? To the teachers? To the students? To the alumni?

(2) How much money should be spent for this museum by the college? How much time given by the teachers to its upbuilding?

(3) What should be the scope of this museum, i. e., what articles should be contained in it?

(4) Where should the museum be situated, how arranged and catalogued and under what rules or arrangements should it be open to afford the utmost facility for use?

The answer to the first question may be presented in two ways: First, the museum of the average college of pharmacy should be subordinate to the library, to the equipment of the laboratories and to the quality of the teachers. That is, out of the definite sum that is allotted for expenditure by the college, high grade

teachers should be provided first, well-equipped laboratories next, a modern pharmaceutical library third, and the museum fourth. Second, the value of the museum to the college is very great. No student should be expected to learn the physical characteristics of a drug, chemical or medicine without having the opportunity of seeing, tasting and smelling the article. No teacher should attempt to present the description of any article of pharmacognosy without being fully familiar with its commercial appearance. The museum is the place to learn the appearance of a drug in a way that it will be remembered. For research work in pharmacognosy the value of the museum is unquestioned. To the average

Collection of Rare, Foreign and Powdered Drugs, University of Illinois, School of Pharmacy.

pharmacist, the alumnus, the museum gradually becomes naught but a pleasant memory, largely because it is so situated as to be unavailable for quick and easy use. Where the museums are accessibly located, the alumni often find them of great value for reference. As an advertisement a museum is without doubt an asset to the college. The prospective student in his inspection of the school lingers longest over the orderly array of specimens and cases here presented.

In answer to the next question as to what shall be the scope, the size of the museum, I assume that the ideal of each curator or teacher who chances to read this item: the museum under Dr. Tschirch at the University of Berne with its 50,000 catalogued articles. However, the ideal must give place to the real. Beginning with a college of pharmacy without any collection of drugs that could

by any courtesy be named a museum: one hundred dollars a year for ten years judiciously expended by a capable, earnest curator would provide a fine nucleus for a good museum. A museum when once established largely grows without any serious expenditure of time or money. Little gifts each of relatively small value to the donor are being constantly received. Specimens of drugs often rare and therefore valuable in the museum are received from time to time for purposes of identification. The residue of samples obtained for inspection from the custom's service may be added to the museum. Samples of fine chemicals and galenicals prepared in the class room find their place in the museum. Col-

Collection of Official Drugs, University of Illinois, School of Pharmacy.

lections of medicinal chemicals, inorganic and organic, of pharmaceuticals, of alkaloids, active principles and volatile oils are oftentimes presented to the museum by manufacturers of these respective classes of drugs. Crude drugs may be purchased in small quantities, pound or half pounds, from drug importing firms or foreign drug dealers, if the statement is made with the order that the drugs are for museum samples. But one of the most important means of supplying the museum with its choicest specimens is through the collection by friends in our own and in foreign countries of items suitable for the museum.

What shall be included in the museum? The pharmacognosy museum may be divided in a general way into the Crude Drug or Pharmacognosy Proper Division, the Chemical Division and the Pharmaceutical Division.

There will be criticism, I know, against including the chemical and pharmaceutical museums under the general title of Pharmacognosy, however, I defend the title as a good one to apply to the whole College of Pharmacy Museum.

Crude Drug Division.—A crude drug is generally understood to be one consisting of the whole or a part of a plant or animal which has undergone but little change other than drying. Under such a definition the ethereal oils obtained by distillation, the fixed oils obtained by pressure and subsequent purification and the alkaloids and active principles would not be included in the crude drug division,

Fresh Drugs in Alcohol and Crude Drugs, University of Illinois, School of Pharmacy.

but the balsams, oleoresins, resins and gums which have exuded naturally or after incision of the plant and even evaporated plant juices should be included.

The number of crude drugs that have been used by man is legion. From the earliest civilization until recent times they have been much more extensively used than chemical substances. Within the last century chemicals as medicines have become more popular.

The crude drugs fall into a number of groups, the most important of which is the Official Crude Drugs. The official group includes all the crude drugs defined in the current U. S. P. and probably should include the drugs of the National Formulary as well. Whether this group should include drugs not official in the United States but that are defined in foreign pharmacopœias is a question, though in the museum in which I am personally interested we have included

in the Officials not only those drugs defined in the current U. S. P., but also those that have been named in all the revisions of the U. S. P. since the original issue in 1820, and those official in the current pharmacopœias of Europe. Thus our Officials group has become quite large, including upward of 600 titles.

Unofficial Crude Drugs.—The second great group of crude drugs is often designated the Unofficials. This term ordinarily is restricted to those drugs in common use in one's country but not recognized in the national pharmacopœia. However, in our museum we have included in the Unofficials those drugs found in commerce in North America and Europe, but not named in the pharmacopœias of the United States or Europe.

In the large dispensaries and codexes there is described a long list of unofficial drugs, while an examination of one of the more comprehensive American or European drug price lists reveals the fact that here is named a large number of crude drugs included in neither pharmacopœia nor dispensatory. In fact it seems impossible to find a limit to the Unofficial Group.

Native Drugs of Foreign Countries.—Collections of drugs in common use in countries beyond North America and Europe are of value and interest. Thus the native drugs of China form a very extensive and interesting collection, as do also similar collections from Burma and the East Indies, from India, from several districts of Africa and from South America. Such collections fairly complete are difficult to obtain except from a native or resident of the locality.

Drugs in Original Packages.—The containers in which drugs enter commerce and "original packages" of drugs are always items of interest and instructive value. They may be obtained, usually without cost, from jobbers and importers.

The commercial varieties of a single drug make an interesting collection, such as opium, acacia, cinchona, rhubarb, etc., which enters commerce from different countries or localities, which is of several grades of quality or which occurs in several commercial forms.

Adulterated drugs are often found in commerce, especially in the customs houses and in the store rooms of importers, wholesalers and manufacturers. A sample preserved from each lot of adulterated drug met with will soon form a most valuable collection.

Drug Adulterants.—Substances that are or have been employed for adulterating drugs form an exceedingly interesting portion of the crude drug museum. Specimens of such adulterants may be had by garbling the adulterated drug.

Crude drugs preserved in a fresh state in alcohol or by other means are of especial use for the histological study of drugs. A collection of such fresh material can be gradually accumulated and eventually becomes of great value.

A collection of powdered drugs is a necessity in any well-organized pharmacognosy museum. Powdered drugs have largely replaced whole crude drugs in commerce and the pharmacognocist must be familiar with the gross and microscopic appearance of drugs in powdered form.

An herbarium of drug-yielding plants forms an important portion of the

pharmacognosy museum. Such an herbarium should be given first place. The drug plants native to the locality of the museum can be increased by purchase, exchange or travel so as to include specimens of the plants yielding all the more important drugs.

There always forms in the museum a collection noteworthy because of the historical interest of the articles included, such as amulets, charms, drugs used in former times but now neglected, drug samples of great age, drugs at one time possessed by a famous pharmacognocist or pharmacist.

Pictures and lantern slides of drugs and of drug-yielding plants, of drug containers, of the process of drug collection and of drug cultivation, etc.; portraits of pharmacognocists of note; manuscripts and books relating to pharmacognosy that because of age or rarity or especial value should be preserved—all of these may be gathered into still another section of the crude drugs division.

Chemical Division.—The chemistry division of the pharmacognosy museum is arranged in a general way similarly to the crude drug division. A chemical may be defined as a substance possessing a definite molecular composition. Thus this division of the museum would contain all those medicinal substances to which have been ascribed chemical formulas.

The articles in the chemical museum naturally fall into a number of groups, which may be designated somewhat as follows:

Inorganic Medicinal Chemicals.

Organic Medicinal Chemicals.

The Elements.

Ores and Chemicals as found in Nature.

Exhibits illustrating the Preparation of Medicinal Chemicals.

Adulterated Chemicals.

Chemical Reagents.

Chemical Apparatus.

The Inorganic and Organic Sections would include, first, those chemicals official in the pharmacopœias of the U. S. and Europe, and, second, those Unofficials mentioned in the dispensaries and price lists. The special collections are of great interest and value, especially where they are fairly complete, nicely arranged and well exhibited.

Pharmaceutical Division.—The pharmaceutical division of the pharmacognosy museum is of especial interest to the pharmacy student and pharmacist because the items contained therein are largely the products of his own skill; articles which he has presented to the museum and of which he possesses an intimate knowledge.

There might be included in the pharmaceutical museum the following sections:

Official Galenicals.

Unofficial Galenicals.

Alkaloids and Active Principles.

Ethereal and Fixed Oils.

Disinfected Surgical Supplies, including

Cottons, Gauzes, Bandages, Ligatures and Plasters.

Adulterated Pharmaceuticals.

Pharmaceutical Apparatus—

Modern, Ancient, Rare, and Historical.

Pictures, Portraits, Books, Manuscripts, Prescriptions.

Finally, a very short discussion of the fourth point—the location, preservation and arrangement of the museum.

The whole museum may be gathered together and located in one room or it may be located in various rooms throughout the college building. The plan of locating it all at one place, usually a room in connection with the library so that the librarian may also look after the museum, has several advantages, the principal ones of which are: the more impressive appearance made by such an arrangement, the increased facility of use, the advantages presented in cataloging, the assurance of safety which the constant presence of the curator implies.

There are, however, advantages in having the exhibits scattered in the various laboratories and lecture halls, under direct charge of the teachers, especially for the smaller colleges of pharmacy. Thus, much of the formality and inaccessibility of the formal museum is lost: students and teachers, especially, will use the various exhibits much more extensively if they are very conveniently located. Like the dictionary, if it is at your elbow you use it much more often than if it is in the other room. Again the exhibits may often be much better displayed because of the abundance of well lighted wall space in a number of rooms, whereas they would be dark and crowded in a single room. Further, in my opinion, the teachers in each department give more readily of their time and attention to their respective divisions of the museum than if the whole museum was placed in the exclusive charge of one person.

The arrangement of the museum is largely one of personal choice on the part of the curator, though the following points should be observed:

Display each article with such a lighting that it may be studied in detail to the best advantage.

Preserve materials that may deteriorate against deleterious influences, especially sunlight, dust and insects.

Arrange the exhibits in such a way that, given its catalogue number a visitor may easily find any article.

Arrange and label at least the more important exhibits such as the official and unofficial crude drugs, the inorganic and organic chemicals and the official and unofficial galenicals so that any article may be readily found without the catalog numbers.

In the museum of the University of Illinois School of Pharmacy, we have used in the crude drug division for the Officials half-gallon, glass-stoppered, wide-mouth bottles, each bearing a single-line paper label on the neck of the bottle with

hand-painted plain square letters about one-half inch high. Each drug is labeled with its pharmacopœial name, the abbreviated name of the pharmacopœia in which it is defined if other than the U. S. P., and the date of the revision in which it was last official.

The Unofficials are in similar bottles with the label bearing, however, only the botanical name of the plant yielding the drug.

Each of these exhibits is arranged alphabetically on open wall shelving in the roomy pharmacognosy laboratory. These exhibits are accessible to any student or visitor during the time the laboratory is open and upon request at any time the college building is open. The samples of many of the U. S. P. drugs are renewed annually.

The rare foreign drug exhibit is contained in screw-cap glass jars with a several line label stating the botanical source of the drug, the country from whence obtained, etc.

The exhibits of adulterated drugs, drug adulterants and commercial varieties are in quart glass-stoppered bottles arranged on open shelving.

The powdered drugs are in half-pint screw cap glass jars in glass front wall cases.

The fresh crude drugs in alcohol or formaldehyde are contained in pint and quart glass-capped jars.

The original packages are mostly exhibited in large glass front wall cases in the pharmacognosy lecture hall.

The herbarium of drug-yielding plants is in a regular herbarium case.

The walls of the laboratory bear many framed prints in color of drug plants.

In the Chemistry Division the inorganic and organic chemicals are displayed in glass-stoppered bottles on shelving in the laboratory, the elements are in a special small case, the apparatus in large glass front wall cases in the chemistry lecture hall.

In the Pharmaceutical Division the galenicals are mostly in pint cork-stoppered bottles, the alkaloids and active principles in slender footed display bottles, and the other displays in various wall cases in the large pharmacy.

In addition to these displays the college possesses portraits in oil of its deceased teachers and of a number of prominent pharmacists of the U. S. and Europe. Hanging from the walls of the lecture halls and library are photographs of every graduate and teacher of the college since the first graduating class fifty-two years ago. In the library are many old and rare books on materia medica, pharmacy and chemistry.

Some day if opportunity offers we may gather this scattered museum into one room, yet we may suffer disappointment if we do so, for the present arrangement is very satisfactory and affords abundant chance for growth.

THE ANALYSIS OF VANILLA EXTRACT.

CHARLES H. LAWALL AND LEROY FORMAN.

Vanilla extract is defined by the U. S. Department of Agriculture standards as "the flavoring extract prepared from the vanilla bean, with or without sugar or glycerin and contains in 100 cc. the soluble matters from not less than 10 gm. of the vanilla bean."

The vanilla bean is, according to the same authority, "the dried cured fruit of *Vanilla planifolia*."

The tincture of vanilla of the U. S. P. is a preparation conforming to the foregoing standards and the process described in that work is taken as a type process for the preparation of a standard preparation for purposes of comparison by many authorities. Inasmuch as there is nothing said in the standards about the grade or geographical origin of the vanilla beans, it logically follows that a multitude of sins are committed under the name of vanilla extract. The only commercial variety of vanilla bean which is not derived from the *Vanilla planifolia* is the inferior Tahiti bean which comes from a species called *Vanilla pompona*, so that the manufacturer may legally use any grade of Mexican, Bourbon or other variety of bean and make an extract true to the name "vanilla extract," and, to tell the real truth of the matter, there is no way of telling from the composition of the finished article what kind or grade of beans have been used, except by the flavor and aroma, characters not determinable by analytical procedure. Even the inferior Tahiti beans may be used without fear of detection, so the judging of a vanilla extract, after all, depends largely upon the exercise of the critical faculties of taste and smell.

There are certain factors, however, which, when ascertained, aid in arriving at a conclusion as to the genuineness of the product, and give some idea as to its quality. Of these, the principal ones commonly taken into account in judging of an extract are:

- 1 Percentage of alcohol.
- 2 Percentage of residue upon evaporation.
- 3 Percentage of ash.
- 4 Percentage of vanillin.
- 5 Percentage or relative amount of resins and character of same.
- 6 Character of color.
- 7 Presence or absence of such foreign substances as coumarin, acetanilide, etc.

The percentage of alcohol is of importance on account of the fact that if too little be used in extracting the beans the product is deficient in resins and consequently inferior in its flavoring value and aroma. Too much alcohol is also productive of an inferior product. The 60 percent alcoholic menstruum of the U. S. P. tincture is about the upper limit for a first class product and by far the greater number of manufacturers use a 50 percent. alcohol or even slightly lower. The percentage of alcohol in the finished product therefore ranges in high grade extracts from 35 to 55 percent. by volume and the majority are in the neighborhood of 40 percent. Some few commercial extracts of wide reputation are slightly below 35 percent., but they are always more or less turbid from the partial precipitation of resinous matter.

The alcohol may be readily estimated by taking a measured volume of 25 cc. of the extract and diluting it with about 60 cc. of water, placing it in an Erlenmeyer flask connected with a well cooled condenser and distilling off exactly 50 cc. for determination of the alcoholic strength by taking its specific gravity and referring to the appropriate table in the appendix of the U. S. P.

The percentage of residue upon evaporation is usually determined in routine practice more for the sake of observing the character of the residue and for purposes of comparison than for any real value which it possesses as there is no restriction as to the amount of sugar or glycerin which may be used, either of which, of course, increases the amount of residue in proportion to the amount present. It is customary to estimate the residue in 5 cc. of the extract by drying to constant weight upon the water bath.

The percentage of ash, which may readily be ascertained by igniting the residue after its determination, is of value in detecting the use of fixed alkali such as sodium or potassium carbonates or hydroxides, which are sometimes though rarely used to aid in extracting the resinous matter from the beans with a lower percentage of alcohol than would be otherwise possible. The percentage of ash varies somewhat in genuine extracts but we have never seen one which contained more than 0.50 percent by weight.

The percentage of vanillin may vary from 0.10 percent to 0.25 percent in a genuine vanilla extract, which is quite a wide variation when one takes time to consider it. As the value of the extract is largely dependent upon the amount of this constituent present it is customary to estimate it, which can be very readily done by a shaking out process.

The official method of the A. O. A. C. provides for the dealcoholizing of the extract as a preliminary step by repeatedly evaporating to a small volume at a temperature below 70° C. In a large number of analyses made by this method and also by a method simply based upon the removal of the alcohol at water bath temperature, we have been unable to detect any appreciable difference in the results and believe that the amount of vanillin lost by volatilization during concentration is negligible. A simple and satisfactory method is as follows —:

Measure 25 cc. of the extract into a shallow evaporating dish and concentrate to about one third of its volume upon the water bath. Add hot water to make up the original volume and observe the character and amount of resinous matter which precipitates at this stage of the procedure. Then add lead acetate T. S., drop by drop, until no further precipitation is produced. Filter while still warm through a plaited filter into a separatory funnel, washing the residue on the filter with small portions of hot water, being careful not have more than 50 cc. of total filtrate. Add to the liquid in the separatory funnel 25 cc. of ether and agitate thoroughly. When the liquids have separated, draw off the lower aqueous portion and transfer the ether (now containing most of the vanillin) to a tared glass capsule.

Place the aqueous liquid again in the separator, add a fresh portion of 25 cc of ether and repeat the operation, adding the ether to that in the glass capsule. Repeat this procedure a third time, using 15 cc. of ether for the final extraction. The combined ether extractions, when evaporated to dryness at room temperature, leave a varnish like film of nearly colorless vanillin, which upon standing

for a few hours, usually crystallizes in fan shaped radiating crystalline masses throughout the film.

The percentage of vanillin by this method in a high grade extract will be in the neighborhood of 0.20 percent. An extract containing over 0.30 percent is looked upon with suspicion as containing added vanillin. Some cheap extracts contain over 1 percent of vanillin to make up for the deficiency in aroma due to resins, etc. It sometimes happens that when a single bottle of extract of vanilla (holding about 1 fl. oz.) is the only sample available, the procedure as above outlined for alcohol, vanillin, etc., must be modified. Excellent comparative results, agreeing within 0.01 percent as a rule, in the vanillin estimation, have been obtained by the following procedure:

Estimate the alcohol as previously directed, using an asbestos mat between the burner and the flask. Allow the residue from the alcoholic determination to cool in the flask. Then transfer it to the separator without filtering, using water to rinse out the flask. Shake out the liquid in the separator with two portions of 25 cc. each of chloroform and evaporate the chloroform in a tared glass capsule. The residue will be almost pure vanillin, agreeing closely with the results obtained by the use of the official method or the modification previously described.

After shaking out with chloroform, the liquid in the separator may be transferred to a graduated cylinder and an aliquot portion taken for the determination of the residue and the balance used for the tests of the resins to be subsequently described. Thus all of the principal characters may be ascertained in a 30 cc. sample, using 25 cc. for the alcohol, vanillin, resins and residue. The remaining 5 cc. may be used for the caramel test also subsequently described in this article.

The percentage of resins is rarely determined on account of the difficulty of collecting them upon a filter. However, upon dealcoholizing and diluting as directed under determination of vanillin and then passing through a filter, the portion which adheres to the filter may be used for certain identifying tests for the detection of foreign resins, such as color reactions with acids, specific tests for rosin, etc.

An arbitrary factor called the lead number, which is largely influenced by the percentage of normal resins present, is sometimes ascertained by estimating the amount of lead acetate precipitated from a solution of known strength under carefully standardized conditions.

This is a complicated and tedious operation, only of value in doubtful cases and will not be described here.

The character of the color is an important factor. Any caramel color at all is evidence of fraud. The former tests for caramel, such as fullers' earth test, paraldehyde test, amyl alcohol test, etc., were all unsatisfactory. A test which has recently appeared in literature and which upon careful investigation has been found to be extremely reliable is given herewith. Prepare a reagent as follows:

Tannic acid.....	5.00 gm.
Sulphuric acid.....	3.75 cc.
Water q. s. to make.....	250.00 cc.

Take equal parts of the above reagent and of extract of vanilla in a test tube

and heat the mixture to boiling. Stand it aside for 12 hours or over night and observe the character of the precipitated residue at the end of that time. A genuine extract of vanilla will show a flocculent, brownish precipitate which shows no tendency to adhere to the bottom of the test tube. Any caramel present will be indicated by a blackish brown sediment adherent to the bottom of the test tube. In applying this test the best results are obtained when specimens of known composition (of both genuine and caramel colored goods) are simultaneously tested.

Coumarin, the odorous principle of the tonka bean, is frequently present in cheap or imitation vanilla extracts, either through tonka beans having been used or by the addition of coumarin itself. The odor of coumarin is so distinctive, even when present in small proportions in combination with vanillin, that it is not always necessary to test for it. Where its presence is suspected it may readily be detected by redissolving the previously estimated vanillin in ether, transferring to a separatory funnel and shaking out with three or four portions of 2 percent ammonia water. This shaking out removes the vanillin completely and upon again evaporating the ethereal solution in a glass capsule any coumarin present will be left as a residue and may be weighed and identified by its color and its melting point of 67° C. (vanillin has a melting point of 80° C.).

Acetanilide, which has sometimes been found as an adulterant of vanillin, would also be left as a residue from this second ethereal solution with the coumarin, and it may easily be detected by treating the coumarin residue with petroleum benzine, which entirely dissolves coumarin but leaves behind any acetanilide, which in its turn may be identified by its characteristic chemical tests and its melting point of 112° C.

While there is little that is new or original in the foregoing communication apart from the procedure directed for the examination of the sample where only a limited amount is available, it is offered as being of interest to many pharmacists who have neither the time nor opportunity to familiarize themselves with the analytical procedures described in works on food analysis but who would eagerly avail themselves of points offered in an article of this kind.

OREGON BALSAM.

O. A. BEATH AND L. E. SAYRE.

Since the time that Dowzard expressed his opinion that Oregon Balsam was a mixture of colophony and oil of turpentine, the question of its origin has been frequently asked.

Mr. Rabak, a pupil of Professor Kremer's, of the University of Wisconsin, undertook to determine the actual source of this oleoresin. His investigation proved quite conclusively that Oregon Balsam was collected from a species of fir or possibly several species. Samples of twigs and cones yielding this product were identified officially as *Pseudotsuga mucronata* (Sudworth) and, as to synonym, *Pseudotsuga Douglasii* (Carrière). For details concerning the examination of the resin, the author's paper must be consulted (Pharm. Rev., Aug., 1904, 293-299).

Further investigation was made by Mr. Beath in 1912 under the supervision of Professor Kremers. A sample was secured, accompanied with twigs and cones and was identified as belonging to the specie, *Pseudotsuga taxifolia*.

The oleoresin was obtained by wounding the body of the tree. It was milky white and had the same general appearance as a sample observed at the U. S. Forest Products Laboratory. This latter came from the Douglas Fir (*Pseudotsuga taxifolia*).

The following report is a summary of the analysis made by Mr. Rabak and Mr. Beath:

OLEORESIN.

	Oregon Balsam (commercial) (Rabak)	Abies amabilis (Rabak)	Pseudotsuga taxifolia, (Beath)
Sp. Gr.....	0.985	0.969
(a) _D	+2° 30'	0	+1.48°
Acid No.....	103	44	100
Color	Pale yellow	Pale yellow	Milky appearance*

VOLATILE OIL.

Yield	25%	40%	15% ?
Sp. Gr.....	0.882	0.852	0.8705
(a) _D	-34° .37'	-12° .17'	-46° .47'

RESIN.

(a) _D	0	+19° 6'
Acid No.....	70	129

During the past year, the investigation has been carried on by Mr. Beath, who, with the aid of the Department of Pharmacy in matters of correspondence, etc., has led to a further penetration of the subject and has added somewhat to the material formerly contributed. Through the firm of Faxon & Gallagher, of Kansas City, communication was affected with persons and firms whose correspondence is appended to this article.

The object was to collect as many samples of Oregon Balsam as possible, accompanied with as much information as could be secured.

The following firms were written to relative to information as to the purchasing of Oregon Balsam at first hand:

Oregon Wood Distilling Co., Linnton, Oregon; D. M. Dunn Co., Portland Oregon; Heitshu, Grant & Co., Portland, Oregon; Fisher, Thorsen & Co., Portland, Oregon; W. P. Fuller Co., Portland, Oregon; Rasmussen & Co., Portland, Oregon; Blumauer-Frank Co., Portland, Oregon; Stewart & Holmes Drug Co., Seattle, Washington; Lehn & Fink Drug Co., New York City; National Aniline Co., New York City; McKesson & Robbins, New York City.

The following are excerpts from the various answers received:

" * * * Regret that it is impossible for us to give you the exact knowledge you require, as we have been endeavoring to secure this information for some time, especially on account of the present price in this market for Oregon Balsam which is \$2.00 per gallon.

"McKESSON & ROBBINS."

" * * * In reply would state that we are very large handlers of this article and have a shipment now on the way from the Pacific Coast. At the present time, however, this market

* Sample of Douglas fir (*Pseudotsuga taxifolia*) observed at the Forest Products Laboratory had the same appearance as that of the sample examined.

is pretty bare of this article, and the only holder of same is asking about \$2.00 per gallon. Our price to arrive is \$1.25 per gallon, in barrels, and \$1.35 per gallon, in cans.

"We have made inquiries of a number of Oregon jobbers, but none of them are in a position to offer us any, and it was only by accident that we ran across a holder of the article. * * *

NATIONAL ANILINE & CHEMICAL CO."

" * * * wish to advise you that any of the wholesale druggists in the states of Washington and Oregon will be able to furnish the information required by you. LEHN & FINK."

" * * * if you will kindly refer your inquiry to—

"Oregon Wood Distilling Co., Linnton, Oregon;

"D M Dunn Company, Portland, Oregon;

"Heitshu Grant Co., Portland, Oregon;

"Fisher Thorsen Co., Portland, Oregon;

"W. P. Fuller Co., Portland, Oregon;

"Rasmussen & Co., Portland, Oregon,

"no doubt you will gather information and prices from some of these sources.

"BLUMAUER-FRANK DRUG COMPANY."

" * * * Oregon Fir Balsam applies to the Northwest, as this section in early years was known as Oregon. We buy all of our Fir Balsam locally and could supply you with any quantity you require. We assume from the tenor of your letter, however, that you would only desire a small quantity, which would amount to very little, as it is cheap.

"STEWART & HOLMES DRUG CO."

" * * * as we do not carry this material, have referred your letter to the Oregon Wood Distilling Co., of this city, who will no doubt be able to fill your requirements.

"RASMUSSEN & CO."

" * * * We have today sent you by mail ¼ lb. of Fir Balsam in compliance with yours of the 24th. Please accept with our compliments. STEWART & HOLMES DRUG CO."

" * * * have to advise that we do not handle the Oregon Balsam Fir mentioned, and have taken the liberty of referring the inquiry to the Oregon Wood Distilling Co., who have a plant near this city, and we believe are in position to supply goods of this character.

"W. P. FULLER & CO."

" * * * we are mailing you under separate cover, a sample of Oregon Balsam Fir. Please examine this sample and let us know in what quantity you can use same. On receipt of your reply, we will quote prices. FISHER, THORSEN & CO."

" * * * In respect to Oregon Balsam Fir will state that the inclemency of the weather has made it impossible for the gatherers to get any of this article for the last two months and there has been positively a veritable famine on this product, the demand far exceeding the supply, and for that reason the price is now \$30.00 a barrel, f. o. b. shipping point. It will be impossible for us to guarantee delivery but expect to have some Balsam in the course of the next week or so, at which time we will advise you definitely. HEITSHU GRANT & CO."

It will be noted that several of the letters received have indicated that the Oregon Wood Distilling Company should be able to furnish a satisfactory explanation as to where Oregon Balsam could be secured first hand. This company did not make any reply to our inquiry and as a consequence, our report lacks the testimony of a firm purported to produce Oregon Balsam commercially.

The attempt to settle the origin of Oregon Balsam has involved considerable time and patience, as is the case of all subjects of this class. There seems to be a trade secret connected with it that is not easy to penetrate. For over twenty years, the subject has been one of considerable interest. It would appear that practically all that could be said about its origin has been written. To advance the investigation the thing remaining to be done was to fathom the source of supply by coming into direct contact with the producers of the article. While the author has not been able to do this, he has endeavored to keep the subject alive, hoping by this means to multiply the inquiries into the problem, believing that if a persistent effort is kept up in the direction indicated, the final solution as to the actual source of Oregon Balsam will finally be reached. The present inquiry, however, has only given results relating to Oregon Balsam as furnished in the Kansas market of today and the results of correspondence. The aim being to secure, if possible, information leading up to the original source of the article in question.

HOW MUCH SHOULD COMPRESSED TABLETS VARY IN WEIGHT?

C. H. BRIGGS.

In the manufacture of compressed tablets it is impossible to make every tablet of any particular lot weigh exactly the same as every other tablet. It is quite possible that a drug decision may be issued which will fix a legal standard for the maximum amount of variation which is allowable in the weight of compressed tablets, and the question naturally arises, How much variation should be allowable?

Before going into a discussion of the variation in the weight of tablets, I would first call your attention to the other methods of dispensing medicines in order that we may compare the variation in the individual doses by these methods with the variation in individual tablets.

The several methods of dispensing medicines are quite familiar to all of us. They may be classified roughly as powders, liquids, gelatine capsules, pills and tablets.

Powders.—In the early recollection of the writer, there is a very vivid picture of the family doctor seated at a table and preparing powders by measuring out portions from several bottles by means of his pen knife or spatula. As to the accuracy of this method of putting up prescriptions, there can be little doubt that there were great variations in the amounts of the different ingredients,—variations amounting to 100 percent. or more. It is to be hoped that this practice has entirely gone out of vogue and that the modern physician uses more accurate methods for dispensing.

The usual method of preparing powders in the drug store consists of spreading out the properly weighed and mixed material as evenly as possible and dividing it into the requisite number of powders with the spatula. Is there any druggist present who is willing to guarantee that the powders prepared in his pharmacy by this method will not vary more than 10 percent., or even 20 percent. in weight? And yet this is the approved method of dispensing powders.

Liquids.—The two principal methods of giving liquids is by teaspoonfuls and by drops. How much variation do you suppose there is in teaspoonfuls as measured by different individuals, or even by the same individual at different times? It is safe to say that one man's conception of a teaspoonful may be twice that of another. A test carried out by the writer to determine the variation in a teaspoonful of water as measured by ten different persons using the same teaspoon showed a variation of 71 percent. A still larger variation might be expected if different teaspoons were used.

The other method of dispensing liquids, by drops, is used for more concentrated and more active solutions. It might naturally be expected that this method of dispensing would be very accurate, and yet we all know that there is a big variation in the size of drops. The size of a standard drop has been well defined. However the difficulties of specifying and preparing a dropper that would deliver

a standard drop were so many that the Committee of Revision of the U. S. Pharmacopoeia has refused to recognize a standard dropper.

The size of a drop depends on the consistence of the liquid and size and kind of surface from which it is dropped. A pipette with a large opening will deliver twice as much water to the drop as one with a small opening. Here then again we have another variation of 100 percent. in this means of dispensing liquids.

Capsules.—Happy is the druggist who has a prescription to fill calling for capsules for these do not vary in size. He has only to weigh out the proper amount of material and fill it into the proper number of capsules. But, alas! he must divide the powder as before in the case of dispensing powders or he must fill the capsules full until the material is all used, and guess at the amount in each. Have you ever weighed the contents of ten capsules put up in your store and noted the variation in the weight of individual capsules? Don't do it. Send a prescription for capsules to your nearest competitor and weigh ten of his capsules individually, and then you will have something to talk about.

But enough of powders, liquids and capsules. How about the variation in the weight of compressed tablets? Here the pharmacist can be excused from responsibility for the accurate weight of these rests largely with the pharmaceutical manufacturers who make the bulk of all pills and tablets.

Tablets can be divided into two classes according to the method of manufacture; namely, compressed tablets and tablet triturates. The several steps in the manufacture of compressed tablets are, first, the milling and mixing of the various ingredients until the mixture is entirely uniform; second, the conversion of the powdered material into fine granules that will feed properly in the machines; third, the compressing of the granulated material into tablets by the tablet machines. The last step is the one that controls the size of the tablets. The tablet machine first measures a quantity of the granulation and this is then compressed into a tablet by a punch and die. The size of the tablets can be controlled readily by the operator by regulating the size of the measuring chamber, but the variation in the weight of the individual tablets depends on the accuracy with which the machine measures the granulation and the uniformity of the latter.

In preparing a lot of tablets, the operator first adjusts his machine until it will deliver ten or twenty tablets that will weigh exactly the required number of grains. He is then ready to run out the whole lot, but it is quite necessary that samples be taken at frequent intervals and the weight checked, in order to see that the machine stays properly adjusted. If at the end of the operation the tablets be counted and the actual yield be compared with the theoretical, the amount of variation can be calculated. In looking over the records for several large lots of tablets taken at random from our files, the writer finds a variation of two per cent. or less from the theoretical yield. On one lot the material for 2,000,000 tablets was made into 2,002,594 tablets, while another lot of material for 3,000,000 tablets actually gave 3,010,404, which is a variation of 0.1 percent and 0.3 percent. respectively.

When we compare the accuracy with which this material has been divided into the required number of doses with the crudeness with which a thousand gallon

lot of elixir gets divided into the required number of doses by the many consumers, the slight variation in the yield of the tablets is entirely lost sight of.

Now let us consider the variation in the weight of the individual tablets themselves. It would be an endless and entirely impracticable task to attempt to weigh individually all of any large lot of tablets. Ten tablets were taken at random from each of ten different lots that had been made by different machines and the tablets were weighed separately. The maximum variation was found to be nine percent. from the average, and only seven tablets in the hundred to vary more than five percent. from the average. This variation is certainly very much less than with any of the other methods of dispensing medicines. Does it not seem, therefore, that an occasional variation of 10 percent. or even 15 percent. in the weight of one tablet from the average weight of 100 tablets should be legally allowable? Such a variation would be considered small by the other methods of administering medicines.

In conclusion the writer wishes to emphasize the following:

1st. That the methods of dispensing powders, liquids, and capsules present wide variations in the individual doses.

2nd. That tablets are by far the most accurate means of dispensing medicine.

3rd. That the average weight of a large number of tablets should contain the exact amount of the ingredients claimed by the label.

4th. That a permitted variation of 10 percent. or 15 percent. in the weight of individual tablets would not be excessive as a legal standard.

FROM THE LABORATORIES OF PARKE, DAVIS & CO., DETROIT, MICH., JULY 12, 1913.

CUNILA MARIANA L., A SUBSTITUTE FOR SPIGELIA.

W. W. STOCKBERGER, WASHINGTON, D. C.

During the last few months several crude drug dealers have submitted to the writer for verification commercial samples representing recent shipments of what was supposed to be pinkroot. Upon examination the larger number of these samples proved to be spurious. The sophistication, however, was not *Ruellia*, the usual adulterant, but a new one which was identified as *Cunila Mariana* L.

Virginia is given as the type locality of this plant, known locally as American, mountain, or Maryland dittany, but it is found also in the Ohio valley and the States bordering on the Southern Appalachians. It is of interest to note that within its range of distribution are included those areas in which both *Spigelia marilandica* and *Ruellia ciliosa* are most abundant.

By the gross characters of its roots *Cunila* may be readily distinguished from *Spigelia*. The dry roots of the latter are very friable and break readily with a fairly smooth and usually whitish fracture, while roots of *Cunila* do not break readily but when sharply bent the cortex splits off from the tough woody part in a manner strongly suggestive of *Ruellia*. The microscopical characters of the root as seen in cross section readily differentiate *Cunila* from both *Spigelia* and

Ruellia, but further mention of them is unnecessary since good descriptions of the anatomy of all three plants are readily available in the literature.¹

An effort was made to trace the source which supplied this new substitute, but aside from the mere statement that a large shipment from Kentucky had reached the crude drug markets of the East, nothing was learned. It is probable, however, that more of this root will be collected and marketed and it may be possible eventually to determine the exact locality in which it is being collected.

It is an open question whether the wholesale adulteration of pinkroot which has been so much in evidence during recent years is due to carelessness, ignorance or cupidity on the part of the collectors. Manufacturers using this drug certainly can not afford to jeopardize the purity of their preparations by using the false or adulterated pinkroot, and a concerted effort to drive the spurious drug out of the markets is highly desirable.

Some definite results might follow if the large dealers in pinkroot were to furnish to local buyers for distribution among collectors, a leaflet containing a good picture of the spigelia plant and a warning against the unsatisfactory methods of collection so frequently pursued.

THE COMMERCIAL POSSIBILITIES IN GROWING MEDICINAL PLANTS.

F. A. MILLER, M. S., INDIANAPOLIS.

The commercial possibilities in growing medicinal plants are now recognized by the governments of England, Austria and the United States. The International Congress of Applied Chemistry, a society whose able efforts toward industrial development are now universally recognized, is taking active steps in the investigation of drug plant cultivation through an international committee. Universities, private institutions, and individuals have been induced to broaden their field of investigations to include medicinal plants.

From scattered, disconnected and poorly planned investigations of a minor character this work is gradually being organized with a determination that insures success. The dignity with which this movement is now being advanced removes all chances for doubt as to the practical value of drug growing. The success of such an undertaking will of necessity depend upon the commercial possibilities presented. The work in the United States has now reached a stage where these possibilities must be carefully considered.

The early history and evolution of the cultivation of medicinal plants within the U. S. and other countries has been treated elsewhere in an able manner by several authorities and need not be repeated here. It might be well to add, however, that most of the early work on drug growing was not exhaustive. It gave

¹Holm, Th., Medicinal Plants of North America, No. 5. *Cunila Mariana* L. Merck's Report, vol. 16, pp. 188-189, 1907.

Stockberger, W. W., Pinkroot and Its Substitutes, *Pharmaceutical Review*, vol. 25, pp. 2-21, 33-47, 66-84, 97-107, 1907.

Mansfield, W. M. Ruellia as a Spigelia Substitute. *Druggists Circular*, vol. 53, pp. 110-114. 1909.

us little in the way of methods and in the behavior of medicinal plants under varied conditions. With the exception of a few forms such as cinchona, coca, and opium, little was accomplished upon commercial productions and improvement. Of greater value to the progress of this work would be a careful interpretation of the progressive stages through which some of the valuable economic plants have passed in being brought to their present high state of development. Some of them are as old in cultivation as history itself. Still they are subject to improvement and, rich as some of them are in established varieties, other more valuable ones are being discovered and isolated which surpass their parents in many characteristics. Instead of attempting to solve the more practical phases of the question of drug growing as has been done in modern agriculture we have been busy suggesting long cumbersome lists of probable forms for cultivation and repeating antiquated methods of collecting, curing and packing which are of little practical value and have been handed down from early generations rather than evolved from actual investigations. The methods used have been in opposition to the principles of agriculture. No improved varieties of known cultural requirements were at hand and little effort has been made to produce them. The behavior of active principles under varied soil and climate conditions are imperfectly understood. Supplies of authentic seeds and plants of the more valuable forms are either unknown or extremely rare. And finally the greater number of requests for information upon the commercial possibilities of drug cultivation are from people not versed in the requirements of crude drugs. Not only are they deficient in this respect but they usually have a false impression as to the profits to be derived from such an undertaking. It is in this respect that the greatest care must be exercised in order that the interest now aroused may not be lost through an exaggeration of commercial possibilities. This has already been done to a certain extent and a portion of the recent literature dealing with this phase of drug growing invites discussion and some friendly criticism. The time is now current for the accumulation of practical data and its circulation under the most conservative and carefully guarded statements. There is a demand for information bearing directly upon immediate possibilities in drug growing. This demand should be met by information based upon actual practice and not upon theory and supposition. If this is impossible then a clear confession of our ignorance upon the subject should be in order.

The unfortunate error of one investigator in calculating the productivity of digitalis should serve as a caution to all those engaged in experimental drug growing. The estimated return of 4,606 dollars per acre was sufficiently attractive to engage the immediate attention of the daily press and of prominent trade journals. It created no little feeling and enthusiasm among florists by appearing in one of their most popular journals. This publication is noted for its practical information upon plant culture and is read almost exclusively by commercial growers. In view of the difficulties to be overcome in establishing drug growing it is unfortunate that information of this kind should find its way to practical men. The yield of 100 pounds produced upon 1,120 square feet as given by Prof. Newcomb does not differ greatly from that obtained by myself which was 101 pounds upon 1,089 square feet for *Digitalis gloxinoides*. This form is probably one of the heaviest producers of the purpurea strains and would not be repre-

sentative for the official purpurea. The yield of 101 pounds was also obtained from 80 percent of the maximum number of plants which could be accommodated upon this size plot. This is probably a more nearly perfect stand than could be obtained upon a large scale where an acre or more was involved. That it would not be safe to calculate even the yield alone upon a basis of the above figures is indicated by the fact that only 288 pounds were obtained from one-fourth acre planted with a mixture of several varieties of the purpurea strains.

Kraemer in his fourth edition of *Botany and Pharmacognosy* includes a brief chapter of thirteen pages upon the cultivation of medicinal plants. However brief this chapter may appear there are over seven pages of the thirteen which are devoted strictly to plant names, both common and technical and including probably three hundred different species. The practical value of the publication of such a list in a general chapter upon drug cultivation is in doubt when we consider the very questionable virtue of many of the drugs mentioned. The great majority of these lesser important and questionable drugs are not only still abundant in the wild state but are marketed at extremely low prices and are used by pharmaceutical manufacturers in very small amounts. These conditions together with the growing tendency of the medical profession to reduce the number of drugs used would seem to justify the elimination of many of them from publications supposed to serve a practical purpose. It is said that the average practitioner will use less than twenty vegetable drugs. A few who may be called exceptions and those not of the modern school of medicine may use as many as thirty or forty. Even this liberal figure, however, would not seem to demand a list of three hundred or more as a matter of choice. In number alone such lists as those of Kraemer and of Schneider in "*Pharmaceutical Plants and Their Culture*" might serve to suppress, rather than arouse interest in drug growing. They not only seem discouraging in this respect but are also confusing and impractical. In "*Pharmaceutical Plants and Their Culture*," page 10, the author states that there is no plausible reason why such common but nevertheless very desirable drugs as taraxacum, chicory, mallow, burdock, horehound, milk weed, sambucus, stramonium, rosemary, and many others, should not be very profitably cultivated on a large scale. If cultivated upon a large scale and at the same time profitably these drugs must be held in considerable demand by pharmaceutical manufacturers. This condition certainly does not exist for more than two or three and probably not for more than one of the forms mentioned. Little difficulty has been experienced during the past years in obtaining sufficient quantities of such drugs at very moderate prices. The same is true for a large number of plants mentioned in the latter part of the same publication. This is given up to brief notes upon eight hundred and sixty-nine forms, classified as medicinal and poisonous. It is believed that for all practical purposes at least eight hundred of these forms might well be omitted.

Turning to another phase of the situation it has been found that doubtful comparisons have been made of American grown and foreign drugs. Some of these comparisons have been decidedly too liberal in certain important instances. The production of *Cannabis Indica* in the United States furnishes an example. The advancing price of the foreign drug has made it desirable that the United States produce its own supply. This appeared to be one of the easiest problems in drug

growing, especially in view of the statements of several authorities. These statements are to the effect that American grown cannabis is equally as active physiologically as the imported drug. These broad statements together with requests for the home grown drug have undoubtedly had a stimulating effect upon its production. Few cultural difficulties were encountered and consequently many samples of the drug soon found their way from one part of the country to another. An examination of many of these samples has failed to substantiate the statements of the above authorities. In many instances the samples were also very inferior from a physical standpoint. Samples of this drug produced by the United States Department of Agriculture in South Carolina which so far seem to represent the best American grown product, have tested 75 percent as active as good imported drug. Drug produced in Indiana from foreign seed does not test over 65 percent when compared with the drug from which the seeds were taken and some test as low as 40 percent. In view of this situation it does not seem fair to commercial interests to recommend at this time the raising of this drug upon a large scale. It has also been found that belladonna varies greatly in percentage of alkaloids when grown in this country, and it is very probable that many sections of the country will not be suitable for its commercial production. The possibility of using the entire herb instead of the leaves in an effort to simplify its commercial production may be questionable in view of the great difference in the alkaloidal content of these parts. Samples taken from the same plot assayed as follows: leaves 0.445 percent, leaves and stems 0.300 percent, stems 0.065 percent.

Information in the form of cultural directions may also be made too general. As late as May 10th a request was received for information upon the planting of one acre of digitalis. The impression had been gained that this drug could be started by open field sowing on or about this date. Such cultural directions for digitalis have been published from reliable sources upon two occasions and may or may not have been responsible for this impression. However, it should be generally recognized among investigators that digitalis is not a plant that can be propagated upon a large scale by this method. The same may be said of henbane a drug that is probably in greater need of cultivation and improvement than any other. Immediate results would be very desirable at this time when the quality of the imported supply is extremely poor and the botanical source of the drug is questionable. Repeated failures with the commercial production of this drug have been experienced in England and still the technical difficulties of its cultivation have not been overcome. Such instructions as those of Turner, *Pharmaceutical Journal*, 86, 390, to the effect that henbane is not difficult to grow where the grower has a knowledge of general agriculture and Farwell, *Bulletin of Pharmacy*, 19, 258, that belladonna, henbane, digitalis and aconite can be grown as easily as a field of potatoes are somewhat too general for application. The cultivation of henbane in this country upon an experimental scale has resulted in such complete failure that efforts to continue its investigation have been almost abandoned. I do not agree with Schneider that from a cultural standpoint it can be associated with stramonium, cannabis, tobacco, and belladonna or that to make the culture profitable, only the flowering herb must be used. In the first place the culture of stramonium, cannabis and tobacco are ex-

tremely simple and the propagation of belladonna now fairly well developed. Much difficulty has been experienced, however, in the seeding and transplanting of henbane and in the elimination of insects from the growing plants. In the second place it is extremely doubtful whether any biennial forms can be grown profitably in this country if the second year product is demanded. In my estimation such a demand cannot be based upon strictly economic and scientific principles. The henbane situation for the past three years has demonstrated that conditions may arise which will make it not only advisable but probably necessary to pursue a vigorous search for pharmacopœial substitutes. I have demonstrated repeatedly that much of the commercial henbane is not from *Hyoscyamus niger* of the second year's growth and further-more first year leaves of biennial henbane have been tested which yielded 0.089 percent of alkaloids. This figure is only suggestive but should be an incentive to further investigations upon the production of an annual crop of this drug. As yet however, the uncertainty of the plant under cultivation does not warrant an attempt at commercial productions. The experimental stage has not been passed, and so long as this condition exists little can be said for prospective growers in the nature of direct and specific recommendations.

The foregoing conditions apply not only to henbane but in my estimation to most of the important drug plants now under investigation within the United States. The mere fact that a form is grown experimentally or for garden or decorative purposes does not signify that it can be produced successfully upon a commercial scale. The production of a few specimen plants does not involve field conditions and is no indication of the ease and rapidity with which the same form may be grown commercially. Commercial possibilities have been suggested upon these grounds and the much talked of "profit in weeds" has resulted in more talk than profit. It is now time to reduce the work on drug cultivation to an exact science, and to determine the commercial possibilities of the most promising forms in the same manner as has been done for agricultural and other economic forms. When this has been accomplished there will be ample time for recommendations to practical growers. Until then all inquiries should be met with a clear statement of the uncertainty of immediate commercial possibilities together with an idea of the exacting nature of the requirements for the various classes of medicinal plants.

BOTANICAL DEPARTMENT, ELI LILLY & COMPANY, INDIANAPOLIS, Aug. 4, 1913.

A BIBLIOGRAPHY OF THE DETERIORATION OF DRUGS AND PHARMACEUTICAL PRODUCTS.

E. G. EBERHARDT AND F. R. ELDRED, INDIANAPOLIS, IND.

The term deterioration is here restricted to the decrease of therapeutic value by decomposition or loss of active constituents. It is only in recent years that the matter of the deterioration of drugs and their preparations has received any considerable attention. At least practically all of the systematic work on the subject is of comparatively recent date. The older results were mostly inci-

dental to work along related lines, principally that of standardization. A study of the subject discloses the need of accurate and decisive work as there is still much of uncertainty and diversity of opinion. The importance of the subject and the great advances made in the matter of standardization justifies the hope that the near future will see a marked increase of our knowledge in this field.

We do not presume to offer this as a complete bibliography of the subject, but we have tried in the time at our disposal to make it sufficiently so to give a very fair review of the field. Many references could be seen in abstract only but were considered definite enough to merit inclusion.

It is our purpose to continue the bibliography and to publish additional references after a sufficient interval.

Aconite, The Assay of,—A. B. Stevens,—Bull. Phar., 1911, Vol. 25, p. 237. Also Phar. Jr., Vol. 87, p. 33.

Properly kept the drug does not deteriorate. Chemical assay will detect deterioration.

Aconite, The Effects of Medicinal Doses of, upon the Pulse Rate,—R. D. Rudolph and E. C. Cole,—Am. Jr. Med. Sci., 1912, Vol. 144, p. 788.

Tinctures on the market are usually inert. A large loss of activity observed in aconitine solution in four months.

Alkaloidal Extracts, The Stability of,—H. M. Webster,—Chem. Drugg., 1908, No. 1487, p. 172, through Chem. Absts. Vol. 2, p. 2969; also Proc. A. Ph. A. Vol. 57, p. 73.

Difference found in extracts after two to twenty-five years did not exceed limits of experimental error.

Alkaloidal Fluidextracts and Tinctures, On the Permanence of,—W. L. Scoville,—Proc. Am. Ph. Assn., 1910, Vol. 58, p. 874.

A series of preparations was assayed at intervals of three months during one year. Tabulated results are given.

Alkaloidal Stability of Certain Standardized Preparations of the Br. Pharmacopœia,—W. A. H. Naylor and C. Huxtable,—Pharm. Jr., 1902, Vol. 69, p. 134.

Show from 1% to 5% of depreciation in eight months.

Alkaloidal Tinctures, Stability of,—Farr and Wright,—Phar. Jr., 1894, p. 123, through Proc. A. Ph. A., Vol. 43, p. 622.

The only notable loss observed was in tinctures cinchona and green hellebore and then not exceeding 5% average.

Astringent Preparations, Permanence of,—Wilbur L. Scoville,—Jr. A. Ph. A., 1912, Vol. 1, p. 334.

Tannin estimation made in the fluidextracts of a number of drugs at intervals during the three years show marked changes.

Belladonna Leaves, The Quality of,—A. B. Lyons,—Proc. A. Ph. A., 1886, Vol. 34, p. 110. Concludes that leaf kept in pressed packages for several years shows no evidence of loss.

Belladonna Extract, Keeping Qualities of,—Holger Thaysen,—Schweiz. Wochschr., Vol. 50, p. 605; also Apoth. Ztg., 1912, p. 528; through Chem. Absts. Vol. 7, p. 681.

Alkaloids remain unchanged.

Calcium Sulphide Pills and Tablets,—M. R. Schmidt & H. Engelhardt,—Proc. A. Ph. A., 1910, Vol. 58, p. 1005.

No noticeable deterioration in three year old preparations.

Cannabis Indica, Notes on,—E. M. Holmes,—Phar. Jr. 1902. Vol. 68, p. 342.

Suggests advisability of storing as tincture instead of the drug, to avoid deterioration.

Cannabis Indica and its Galenical Preparations, Physiological Assay of, with Notes on some of the Commercial Products Supposed to Represent the Active Principles of the Drug.—L. W. Famulener and A. B. Lyons.—Proc. A. Ph. A., 1903. Vol. 51, p. 240.

The drug loses activity especially when powdered, likewise the powd. ext. The solid and fluidextracts are permanent.

- Cherry-Laurel Water, The Stability of,—H. Ribaut,—Bull. Sci. Pharmacol. Vol. 17, p. 583; through Chem. Absts. Vol. 5, p. 2895.
HC.N. content decreases irregularly with time.
- Cinchona, Note on the Use of Fl. Ext., for Making Wine of Cinchona,—G. Allard & A. Nourrisson,—Jr. Pharm. Chim. Series 7, Vol. 6, p. 21; through Chem. Absts. Vol. 7, p. 1260.
The alkaloidal strength of the fluid extract diminishes with time.
- Coca Leaves, Notes on the Alkaloids of,—A. B. Lyons,—Am. Jr. Phar., 1885. Vol. 57, p. 466.
States the leaves rapidly deteriorate.
- Coca, A Lecture on, delivered at the Phil. Coll. Pharm., Dec. 1, 1887, by H. H. Rusby,—Am. Jr. Phar., 1888. Vol. 60, p. 199.
Attention is called to the changes occurring during importation.
- Coca and Cocaine Studied Historically,—Sharpe,—Pharm. Jr. Vol. 82, p. 185.
The drug is readily affected by dampness and rendered inert.
- Commercial Crude Drugs, The Variation in Activity of,—F. H. Carr & W. C. Reynolds,—Pharm. Jr., 1908. Vol. 80, p. 543.
Attention is called to the influence of enzymes, in many cases causing loss of activity.
- Digitalis, Activity of Leaves and Stability and Standardization of Tinctures,—Gordon Sharp and F. W. Branson,—Phar. Jr., 1912. Vol. 59, pp. 131, 173. (Abst.) Jr. A. Ph. A. Vol. 1, p. 1431.
Of a number of tinctures, part were found deteriorated at 20 months and nearly all after 28 months.
- Digitalis and Ergot Preparations, Reliability of,—Jr. Am. Med. Assn., 1912. Vol. 58., p. 705
Editorial advocating dating of the preparations named.
- Digitalis and Its Preparations, Deterioration of,—Drug. Cir., 1912. Vol. 56, p. 737.
Answer to a query.
- Digitalis and Its Preparations, The Keeping Properties of,—Jr. Am. Med. Assn., 1913, Vol. 61, p. 202.—Editorial.
- Digitalis and Some of Its Preparations, Observations on the Keeping Properties of,—R. A. Hatcher & C. Eggleston,—Jr. Am. Pharm. Assn., 1913. Vol. II, p. 876, also Am. Jr. Phar. Vol. 85, p. 203.
Leaves of good quality in many instances do not deteriorate with age. When they do it is with exceeding slowness. The same is true of preparations containing 50% or more of alcohol.
- Digitalisblätter, Die Physiologische Wertbestimmung der,—Dr. C. Focke,—Arch. d. Pharm., 1903. Vol. 24, p. 128.
Moisture and air are the prime factors causing deterioration.
- Digitalisblätter, Wertbestimmung der,—H. Ziegenbein,—Arch. der. Pharm., 1902. Vol. 240, p. 454.
Activity is reduced by storage for several years, 40% to 60%.
- Digitalis, Factors Relating to the Standardization of,—Worth Hale,—Proc. Am. Ph. Assn., 1909. Vol. 57, p. 769.
The paper discusses in a general way the variability of the drug and its preparations.
- Digitalis, Infusion of, Deterioration dependent on Acidity,—J. Löwy,—Phar. Ztg., 1906. Vol. 51, p. 1074; through Proc. A. Ph. A. Vol. 55, p. 663.
Infusion loses half its activity in 24 hours at room temperature. Neutralization prevents the change.
- Digitalis, Infusion of, Preservative Effect of Small Percentages of Alcohol,—C. Focke,—Pharm. Ztg., 1909. Vol. 54, p. 757; through Proc. A. Ph. A. Vol. 58, p. 90.
5% alcohol renders it stable within reasonable limits, with 10% alcohol deterioration in nine months is not over 5 to 10%.
- Digitalis, The Alteration of Infusions of, through the action of Micro-organisms and the Preservation of Infusions.—A. Hoger,—Giorn. Farm. Chem. Vol. 61, p. 19; through Chem. Absts., 1912. Vol. 6, p. 913.
Addition of 5% alcohol acts as a preservative and does not impair activity.

- Digitalis, Its Cultivation, Collection and Preparation**,—Edwin L. Newcomb,—*Am. Jr. Ph.*, 1912. Vol. 84, p. 201.
Reviews opinions as to influence of drying on preventing deterioration.
- Digitalis, Keeping Properties of**,—Brissemoret & Joanin, —*Jr. Pharm. Els-Lothr.*, 1911, p. 221; through (abst.) *Phar. Era*, 1912. Vol. 45, p. 13.
Dried leaves kept their activity for 8 to 11 years. Tincture begins to deteriorate after 13 months and is nearly worthless after 15 months.
- Digitalis Leaves, Value of Air-tight Preservation**,—Caesar and Loretz,—*Phar. Ztg.*, 1904. Vol. 49, p. 791; through *Proc. A. Ph. A.* Vol. 53, p. 630.
Preserved unimpaired for one year.
- Digitalis, Method of Collection, Preservation and Dispensing**,—A. Wolff,—*Phar. Zentralh.*, 1903. Vol. 44, p. 585; through *Proc. A. Ph. A.* Vol. 52, p. 659.
It is suggested the thoroughly dried and powdered drug be preserved compressed in tablet form, protected from air.
- Digitalis Powder, Commercial, and Its Preservation**,—A. Joanin,—*Bull. Sci. Pharmacolog.* Vol. 17, p. 707; through *Chem. Absts.*, 1911. Vol. 5, p. 3717; also *Proc. A. Ph. A.* Vol. 59, p. 181.
The drug should be dried so as to contain not over 2% of moisture, powdered and kept protected from moisture.
- Digitalis Preparations, Are Druggists Paying Attention to Deterioration of**,—*Jr. A. Ph. A.* Vol. 1, p. 1453.
A communication to the Editor by Wm. Gray.
- Digitalis Preparations, On the Importance of Determining the Potency of**,—Joseph H. Pratt, —*Bost. Med. & Surg. Jr.*, 1910, Vol. 163, p. 279.
A review of clinical and experimental evidence showing wide variations of activity in different samples.
- Digitalis Preparations, The Efficiency of**,—*Med. Rec.*, 1907, Vol. 71, p. 356.
Editorial.
- Digitalis, Report of A. Ph. A. Committee on Drug Market**,—*Jr. Am. Phar. Assn.*, Vol. 1, p. 500.
Assays of powder over eighteen months old showed no appreciable change.
- Digitalis, Some Points as to Time of Gathering of the Leaves and the Keeping Properties and Standardization of the Tinctures, etc.**—Gordon Sharp & J. Lancaster,—*Phar. Jr.*, 1911, Vol. 86, p. 102.
Tincture begins to deteriorate after thirteen months. Leaves eight and eleven years old were still potent.
- Digitalis, Standardization and the Variability of Crude and of Medicinal Preparations**,—Worth Hale,—*Bull. No. 74, Hygienic Lab., U. S. Public Health & Mar. Hosp. Service*—1911.
A study of the drug and a number of its preparations as to potency and stability.
- Digitalis, Strophanthus and Squill Preparations, Keeping Qualities of**,—Alexander Goodall,—*Phar. Jr.*, 1912, Vol. 89, p. 130; (abst.) *Jr. Am. Ph. A.*, Vol. 1, p. 1435; also *Am. Drug.*, Vol. 60, p. 353.
Tincture Digitalis was found to deteriorate after one year. Of samples of tinctures of strophanthus and squill some were found to deteriorate after three years.
- Digitalis, The Physiological Activity of Acetic Fluidext. of**,—Pearson,—*Am. Jr. Ph.*, 1913, Vol. 85, p. 245.
The acetic menstruum quickly destroys potency.
- Digitalis, The Physiological Standardization of, from the Point of View of the Pharmacist**,—Robt. R. Hallaway,—*Phar. Jr.*, 1909, Vol. 83, p. 801.
Concludes that six months is a safe time limit for the tincture.
- Digitalis, The Variability of**,—Hale,—*Proc. Am. Ph. Assn.*, 1910, Vol. 58, p. 925.
Excessive drying of drug not required. Preparations seem to deteriorate little if made with 70% alcohol.

Digitalis, Tr., Its Potency and Keeping Properties,—Alexander Goodall,—Br. Med. Jr., 1912, Vol. I, p. 887; through Am. Jr. Med. Sci., Vol. 144, p. 299, 1912; also Chem. Absts., Vol. 7, p. 536.

Tinctures retain activity for about one year, after 18 months some are under standard, and after 22 months all of them.

Digitalis, Tincture of, Necessity of Protection from Light,—C. Focke,—Phar. Ztg., 1904, Vol. 49, p. 543; through Proc. A. Ph. A., Vol. 53, p. 599.

If kept in the dark deterioration amounts to 10% to 17%. If exposed to light, from 33% to 50% in one year.

Digitalis, Tincture,—Moran,—Med. Chronicle, 1911-12, Vol. 55, p. 1.

Tinctures tested from four to twenty years old. A tincture of *Digitalis* should retain its activity for two or three years. (Seen in reference only.)

Digitalis, Ueber die Bestimmung des Pharmakologischen Wirkungswertes der Blätter von,—Arnold Holste,—Arch. Exp. Path., 1911, Vol. 66, p. 161.

No change apparent in relative activity after approximately one year.

Digitalis, Ueber den Wert der Frischen Fol., und ihre Konservierung,—M. Winckel,—Münch. Med. Wochenschr., 1911, Vol. 58, p. 575.

Permanence is claimed for powdered drug in tablet form, prepared by preventing the action of enzymes in the fresh leaf.

Diluted Hydrocyanic Acid, The Deterioration of,—Virgil Coblenz and Otto May,—Proc. Am. Phar. Assn., 1908, Vol. 56, p. 879.

Experiments to determine the influence of light, alkali, acid, alcohol and acetanilid on decomposition.

Drug Deterioration—Texas State Jr. of Med., 1912, p. 159; through Jr. A. Ph. A. 1913, Vol. II, p. 82.

Editorial in support of dating preparations.

Drug Extracts of Various Kinds, Report of Committee of Pharm. Chemists Appointed for the Investigation of, to Determine their Rate of Deterioration. 1908.

A compilation of reports of investigations from a number of manufacturing laboratories.

Drug Extracts, Stability of,—A pamphlet containing report on deterioration from the laboratories of a number of manufacturing pharmacists,—1907-8.

Drugs, Short Notes on the Deterioration of, and Suggestions for the Prevention thereof,—J. S. Hill,—Phar. Jr., 1904, Vol. 72, p. 652.

Brief general discussion of agencies causing deterioration.

Drugs, Some Experiences in the Testing of, by Bio-Chemical Methods, with Special Reference to *Digitalis*, Squill and *Strophanthus*,—Wm. Martin,—Pharm. Jr., 1909, Vol. 83, p. 149.

Digitalis drug if properly prepared and stored, retains activity for many years and the tincture for nine or twelve months. Tinct. Squill begins to deteriorate sooner than *digitalis*, but the change is slower. Tinct. *Strophanthus* remains unimpaired for many years.

Drugs, The Bio-Chemical Standardization of,—W. E. Dixon and G. S. Haynes,—Proc. Therap. Soc., 1905; through Pharm. Jr., Vol. 75, p. 754.

The variability of commercial tinctures may be due to deterioration. Standard tinctures were unchanged after eight months.

Drugs, The deterioration of,—Jr. Am. Med. Assn., 1912, Vol. 59, p. 959.

Communication from the Council on Pharmacy and Chemistry of the A. M. A., recommending the dating of certain preparations.

Drugs, The Preservation of,—Linwood A. Brown,—Bull. No. 150, Ky. Agr. Exp. Sta. of the State Univ.

Discusses the storage of crude drugs and various pharmaceutical preparations.

Ergot,—R. Kobert,—Central. f. Gynäkol., 1886, Vol. X, p. 306.

Concludes that Ergot more than a year old has no action on the uterus. (Seen in reference only.)

Ergot,—Kehrer,—Arch. f. Exp. Path. u. Pharm., 1908, Vol. 58, p. 366.

Within one year the activity sinks to 1/7 of the original strength and in two years to 1/5. (Seen in reference only.)

- Ergot, An Experimental Study of the Pharmacology of,—Wood & Hofer,—Arch. Int. Med., 1910, Vol. 6, p. 388.
A fluid extract exposed to air deteriorates extremely rapidly. Under the most favorable conditions the loss of strength approximates 10% a month.
- Ergot; A Symposium,—Jr. Am. Phar. Assn., 1912, Vol. 1, p. 653.
A discussion of various phases of the subject at the meeting of the N. Y. Branch of the Am. Phar. Assn., May 13, 1912, by H. H. Rusby, C. E. Vanderkleed and Cornelius De Jonge.
- Ergot, Enzymes in,—J. Schindelmeyer,—Apoth. Ztg., 1909, Vol. 24, p. 837; through Chem. Absts., Vol. 4, p. 1083; also Proc. A. P. A., Vol. 58, p. 157.
As complete and rapid drying prevents deterioration, this may be caused by enzymes, the presence of two being demonstrated.
- Ergot, Experiments on Deterioration of,—Meulenhoff,—Nederl. Tijdschr. v. Pharm. (abst.) Phar. Rundsch., 1900, Vol. XXVI, pp. 738-772.
Believes that ergot under suitable conditions retains considerable activity for five years. (Seen in reference only.)
- Ergot, How long does Liquid Extract of, Retain its Pharmacological Activity,—Phar. Jr., 1908, Vol. 80, p. 82.
By clinical trial no deterioration was apparent after one year. It is not necessary that ergot preparations be kept longer than twelve months.
- Ergot, Intravenous Injection of,—Sollman and Brown,—Jr. Am. Med. Assn., 1905, Vol. 45, p. 229.
Comparisons were made of eleven different preparations of ergot, both fresh and old. Age of drug seems to make no difference.
- Ergot; Its Production and Collection in Russia,—D. A. Ruffman and T. Maben,—Pharm. Jr., 1908, Vol. 80, p. 247.
Effect of age on ergot is discussed.
- Ergot Preparations, A New and Reliable Method for the Preservation of,—Paul S. Pittinger and Chas. E. Vanderkleed,—Jr. Am. Phar. Assn., 1912, Vol. 1, p. 799.
Contact with air is the most potent cause of deterioration. A vacuum method of storage will preserve for a considerable time.
- Ergot, Preservation of,—Dragendorff,—(abst.) Proc. Am. Phar. Assn., 1877, Vol. 25, p. 119.
The oxidation of the fat causes deterioration; would retain activity if fat were removed.
- Ergot, Fluidext., Relative Strength of Fresh and Old Samples of,—C. C. Haskell and C. R. Eckler,—Jr. Am. Phar. Assn., 1912, Vol. 1, p. 412.
Properly kept fluid extract retains activity for two to two and one-half years. after which deterioration becomes apparent, amounting to 50% in four or five years.
- Ergot, Stability of Pressed,—John Moss,—Yearbook of Phar., 1885, p. 410; through Proc. Am. Phar. Assn., 1886, Vol. 34, p. 371.
A sample of ergot, pressed to remove oil, retained its potency for six and one-half years.
- Ergot, Stability of when Deprived of Fixed Oil,—Hermann Werner,—Phar. Ztg., 1881, p. 397; through Proc. Am. Phar. Assn., 1882, Vol. 30, p. 142.
Ergot so treated kept its virtues unimpaired for two years or more.
- Ergot, Standardization of,—H. C. Wood and C. A. Hofer,—Univ. of Pa. Med. Bull., 1909, Vol. 21, p. 347.
Of twelve fluid extracts examined two were active. Both drug and fluid extract deteriorate rapidly.
- Ergot, The Chemical Assay of Fluidextract of,—J. R. Rippetoe,—Am. Jr. Phar., 1910, Vol. 2, p. 119.
There is marked difference between fresh and old preparations.
- Ergot and Its Fluidextracts, The Keeping Qualities of,—H. C. Wood, Jr.,—Am. Jr. Phar., 1911, Vol. 83, p. 172.
Fluidextract deteriorates rapidly, from 1.3% to 3.5% per week, according to conditions. Should not be kept longer than one year.

- Ergot, The Physiological Standardization of,—C. W. Edmunds and Worth Hale,—Bull. No. 76, Hygienic Lab., U. S. Pub. Health and Mar. Hosp. Service, 1911.
Fluidextracts vary greatly. Preparations should be marked with date of manufacture.
- Ergot, The Rate of Deterioration of Fluidext. of,—Wood,—Proc. Am. Ph. Assn., 1910, Vol. 58, p. 883.
Fluidextract under the most favorable conditions loses 45% to 50% in the first year.
Under unfavorable conditions the same loss occurs in three months.
- Extracts, Belladonna and Henbane, Variation of Alkaloid on Keeping,—G. Ortlieb,—Phar. Ztg., 1903, p. 162; through Proc. Am. Phar. Assn., Vol. 51, p. 621.
Alkaloidal value diminishes on keeping.
- Extracts, Variation of Alkaloids in Some,—Jean Fricotel,—Bull. Sci. Pharmacolog., 1908, Vol. 15, p. 687; through Chem. Absts., Vol. 4, p. 234; also Proc. A. Ph. A., Vol. 57, p. 73.
Moist extracts show decrease in alkaloid after eight months in conium, belladonna, stramonium, opium and aconite.
- Fluidextracts, Value of Glycerin as Solvent and Preservative,—Richard Firlas,—Apoth. Ztg., 1909, Vol. 24, p. 721; through Proc. Am. Phar. Assn., Vol. 58, p. 85.
Alkaloid diminishes more rapidly in fluidextracts made without glycerin.
- Folia Belladonna, F. Hyoscyami u. F. Stramonii, Ueber die Aufbewahrungsdauer von,—R. Gaze,—Apoth. Ztg., 1912, p. 402; through Phar. Zentrallh., Vol. 53, p. 1406.
The powdered drugs were kept in glass-stoppered bottles at room temperature and assayed at intervals during two years showing no loss.
- Galenical Preparations Containing Alkaloids, Stability of,—Dohme & Engelhardt,—Proc. Am. Phar. Assn., 1910, Vol. 58, p. 782.
All fluidextracts tested keep their alkaloidal strength well, excepting those of coca and physostigma.
- Galenical Preparations of the U. S. P., Detailed Investigations of Certain, with Special Reference to their Stability,—Dr. M. Clayton Thrush,—Pharm. Era, 1912, Vol. XLV, p. 750.
A general discussion of results obtained by others with conclusions by the author.
- Galenical Preparations, The Stability of,—Dohme,—Am. Drug., 1909, Vol. 55, p. 37.
A number of products of various ages were assayed. No appreciable deterioration found except in powd. ext. physostigma, fluidextracts of coca and aconite and tincture aconite.
- Galenicals, Deterioration of,—Phar. Era, 1912, Vol. 45, p. 741. Editorial.
- Galenicals, The Potency and Keeping Properties of Some, as Determined by Physiological Tests,—Alexander Goodall,—Phar. Jr., 1912, Vol. 89, p. 130.
Tincture digitalis not reliable after one year. Tr. strophanthus retains activity at least three years. Tr. squill may deteriorate after two years.
- Heart Tonics, The Pharmacological Assay of,—Houghton & Hamilton,—Proc. Am. Ph. Assn., 1909, Vol. 57, p. 773; also Am. Jr. Phar., Vol. 81, p. 461.
An investigation of the potency of preparations of digitalis, squill, convallaria and strophanthus, showing loss with age in digitalis.
- Hydrastis, Ausscheidungen in Extractum Fluidum,—C. Linde,—Arch. d. Phar., 1898, Vol. 236, p. 698.
The precipitate deposited in fluidextract consists principally of berberin and hydrastin.
- Hydrastis, Extractum, Fluidum,—Kunze,—Apoth. Ztg., Vol. 28, p. 223; through Chem. Absts., 1913, Vol. 7, p. 2089.
A specially prepared sample changed from 2.86% hydrastine to 2.19% in one year.

Oxidation is the cause of loss of activity. Cannabis and preparations should be stored in hermetically sealed containers.
- Ipecac, A Study of, and Review of its Literature,—R. R. D. Cline,—Southern Phar. Jr., Vol. 4, pp. 11 and 56.
If kept in a cool dry place the drug retains its activity. The pharmaceutical preparations often deteriorate enormously.
- Ipecac, Ext. Liquidum, B. P.,—J. W. Thompson,—Phar. Jr., 1900, Vol. 64, p. 54.
Finds liquid extract unchanged after 6 and 7 months.
- Ipecacuanha, Stability of the B. P. Liquid Extract,—H. Wippell Gadd,—Chem. and Drug., 1901, p. 21; through Proc. Am. Phar. Assn., Vol. 49, p. 574.
The assay remains unchanged after four months in liquid extract, wine and vinegar of ipecac.
- Ipecacuanha, The B. P. Preparations of,—R. Glode Guyer,—Phar. Jr., 1899, Vol. 63, p. 622.
Deterioration noted in liquid extract and other preparations.
- Jodtinktur, Ueber die Haltbarkeit der,—L. Johannessen,—Pharm. Zentralh., 1913, vol. 54, p. 221.
Determinations of free I and acidity (HI) at intervals of one week in different tinctures. KI increases stability.
- Medicinal Plants, Retrogression of Active Substance in, by the Action of Enzymes,—P. Lami,—Bull. Chim. Farm., 1911, Vol. 50, p. 835; through Chem. Abst., Vol. 6, p. 1809.
Suggests prevention of change by sterilization with hot ethyl or methyl alcohol vapors and subsequent drying.
- Medicinal Plants, Sterilization and Drying of,—E. Bourquelot,—Jr. Pharm. Chim., Series 7, Vol. 3, p. 149, through Chem. absts., 1911, Vol. 5, p. 2412.
Loss of active substance by enzyme action amounted to 31% in aconite leaves, 21.7% in digitalis, 10% in aconite root, 26.4% in colchicum bulbs.

- Medicinal Plants, Sterilization of. Abst. of a lecture delivered before the Academy of Medicine, Paris, by Prof. E. Bourquelot,—Phar. Era, 1912, Vol. 45, p. 599.
Alkaloid is lost through the action of ferments.
- Mutterkornwirkung, Beiträge zur Kenntniss der,—A. Grünfeld,—Arb. d. Pharmakol. Inst., Dorpat, 1892, Vol. 8, p. 108. (Seen only in reference.)
Concludes that under ordinary conditions Ergot is worthless after 6 months.
- Mutterkorns, Geburtsklin. Untersuch. u. d. Haltbarkeit. des,—A. Bishofsberger,—Diss. Bern., 1897. (Seen only in reference.)
The effects of one and two year old drugs was compared clinically, showing a moderate decrease of activity in the older drugs.
- Narcotic Extracts, Study of Some,—E. Carlinfanti,—Bull. Chim. Farm., Vol. 51, p. 777; through Chem. Absts., 1913, Vol. 7, p. 1400.
Assays of extracts of aconite, belladonna, hyoscyamus and nux vomica show practically no change in two years.
- Nitroglycerin in Tablets, Comments on Some Official Standards and Tests,—Henry L. Bernegau,—Am. Jr. Ph., 1907, Vol. 79, p. 555.
A number of lots of tablets showed no loss in nine months.
- Nitroglycerin Tablets, Digitalin Tablets and Fluidextract Ergot, Physiologic Assay of,—C. H. Edmunds and Geo. B. Roth,—Jr. Am. Med. Assn., 1908, Vol. 51, p. 2130.
Nitroglycerin tablets lost none of their strength in two years. Fl. Ext. Ergot showed variation in strength. One sample apparently had deteriorated when retested after three months.
- Opium, The Keeping Qualities of Powdered,—L. Debordeaux,—Jr. Phar. Chim., Series 7, Vol. 6, p. 491; through Chem. Absts., 1913, Vol. 7, p. 680.
Shows increase in insoluble morphine with age; also a decrease in total morphine apparently due to oxidation.
- Pepsin and Pepsin Preparations, Systematic Observations on,—C. T. Nixon,—Proc. Am. Phar. Assn., 1910, Vol. 58, p. 1264.
Alcoholic preparations lost 10% activity in three weeks, 20% in five weeks, and were practically inert after one year.
- Pepsin, Conservation of the Activity of, in Elixirs of Pepsin,—E. Thibault,—Jr. Pharm. Chim., Series 7, Vol. 1, p. 480; through Chem. Absts., 1911, Vol. 5, p. 1823.
Claims that pepsin is weakened by prolonged contact with alcohol stronger than 10%.
- Pepsin, Effect of Alcohol is Solution of,—Eugene Thibault,—Jr. Pharm. Chim., Series 6, Vol. 15, p. 161; through Proc. Am. Phar. Assn., 1902, Vol. 50, p. 1081.
Shows marked diminution of peptic activity after prolonged contact with weak alcohol.
- Pepsin, Lactated, Elixir of,—W. A. Pearson,—Proc. Am. Phar. Assn., 1909, Vol. 57, p. 905.
Tests made as to amylolytic and proteolytic activity. A preparation containing 15% alcohol shows only about one-half the theoretical pepsin strength after a few weeks.
- Pepsin, Pancreatin and Combinations of these Ferments, Laboratory Studies of,—A. Zimmerman,—Jr. Ind. and Eng. Chem., 1911, Vol. 3, p. 750.
Pepsin and pancreatin with the proper degree of acidity can be kept in the same solution for at least two and one-half years, without injury to either.
- Pepsin Solutions, Effects of Hydrochloric Acid on,—Liebmann & Johannssen,—Ugeskrift for Lager, 1911, No. 25; through Phar. Zentrallh., Vol. 53, p. 263; also Phar. Era, 1912, Vol. 45, p. 313.
The presence of HCl causes loss of peptic activity proportionate to the acidity and the time of standing.
- Pepsin, Stability of Peptonizing Power of Liquid Preparations of,—A. Petit and A. L. Petit,—Jr. Phar. Chim., Series 7, Vol. 1, p. 150; through Proc. A. Ph. A., Vol. 58, p. 393; also Chem. Absts., Vol. 4, p. 2977.
Experiments extending over more than six years show that elixirs and wines retain digestive power for years practically undiminished.
- Pharmaceutical Preparations, Causes of Deterioration to be Avoided,—Leon C. Fink,—Bull. Phar., 1898, p. 105; through Proc. Am. Phar. Assn., Vol. 46, p. 652.
Deterioration may be avoided by proper care to avoid the influence of air, moisture, cold, heat and sunlight.

Pharmaceutical Preparations, Influence of Enzymes in the Production of,—M. Winckel,—Schweiz. Wochschr., Vol. 47, p. 705; through Chem. Absts., 1910, Vol. 4, p. 1085.

On the influence of the elimination of enzyme action in conserving digitalis and ergot.

Pharmaceutical Preparations, Note on the Loss of Strength of Some, by long Storage,—R. A. Cripp,—Ph. Jr., 1907, Vol. 78, p. 519.

Shows the results of tests at intervals on Acet. Scillae, Liq. Ammon. Fort., Liq. Ammon. and Tr. Quin. Ammon.

Phosphorized Oil, The Permanence of,—Hugo Korte,—Phar. Ztg., Vol. 53, p. 655; through Chem. Absts., 1909, Vol. 3, p. 98.

Under some conditions the phosphorous content diminished rapidly. Light seems to exert more influence than air.

Report of Analysis of Preparations under the Food and Drug Law,—L. E. Sayre,—Trans. Kansas Acad. Sci., Vol. 22, p. 100.

To answer the question as to what constitutes deterioration, Prof. Sayre proposes to define it as a deviation from the professed standard * * * as may be determined by microscopical, chemical and macroscopical examination.

Sanguinaria, Assay of Fluidextract of,—H. B. Meade,—Jr. Am. Phar. Assn., 1912, Vol. 1, p. 134.

The alkaloid content fell from 2.58 gm. per 100 cc. on Feb. 21 to 2.23 gm. on June 1.

Sarsaparillen, Ueber die Pharmakologische Bedeutung und die Biologische Wertbestimmung der, und ihnen verwandter Drogen.—Ber. d. Deut. Phar. Gesell., 1912, Vol. 22, p. 205,—R. Kobert,—Quillaja, p. 215; Senega, p. 218; Sarsaparilla, p. 227.

Testing the haemolytic effect on various kinds of blood, the author finds thirty year old quillaja bark practically unchanged. Thirty year old senega is only 1/5 the strength of fresh root, and Honduras and Vera Cruz sarsaparillas of the same age about 1/5 and 2/3 respectively.

Sirupus Ferri Iodati,—P. Bohrisch,—Pharm. Zentralh., 1913, Vol. 54, pp. 343, 371.

A general discussion as to preparation and preservation, with assays on 19 samples, fresh, at six months and twelve months.

Solanaceous Extracts, Keeping Properties of,—Ribaut,—Bull. d. Sci. Pharm., 1908, Vol. 15, p. 495; through Phar. Jr., 1908, Vol. 81, p. 588; also Proc. Am. Phar. Assn., Vol. 57, p. 74.

Loss observed after four years: Ext. Belladonna leaves, 3% to 45%; Ext. Hyoscyamus, 69%; Ext. Stramon. leaves, 8% and 31%; Ext. Bellad. root, 1% to 12%; Ext. Hyoscyamus seed, 25%.

Spirit of Nitrous Ether, Inquiry into Causes of Change,—E. H. Farr and R. Wright,—Trans. Br. Phar. Conf., 1901, p. 447; through Proc. Am. Phar. Assn., Vol. 50, p. 749.

Deterioration is extremely rapid under ordinary conditions of storage.

Spirit of Nitrous Ether B. P., Progressive Deterioration in Containers,—S. F. Burford.—Chem. and Drug., 1908, p. 108; through Proc. Am. Phar. Assn., Vol. 50, p. 749.

Loss observed at intervals of 30 days during six months, when it had lost 82%.

Spirit of Nitrous Ether, The Keeping of, and a Suggestion for a Change in Formula,—Linwood A. Brown,—Am. Drug., 1911, Vol. 59, p. 215.

Gives results of assays made at intervals of two weeks on twelve different samples stored under varying conditions.

Spirit of Nitrous Ether, Deterioration of,—F. L. Shannon,—Jr. Am. Phar. Assn., 1910, Vol. II, p. 83.

Results are given on seven samples kept under average conditions and assayed at intervals of three months during fifteen months.

Spirit of Nitrous Ether, Preservation of,—G. E. Show,—Phar. Jr., 1903, Vol. 71, p. 236.

Properly stored, there is but slight loss. Under unfavorable conditions the loss in 14 days is from 12½% to 99%.

Standard Pharmaceuticals, Deterioration of Some,—H. E. Barnard,—Ph. Rev., 1908, Vol. 26, pp. 308, 321.

Experiments show an increase in strength with age in spirit of camphor and tincture of iodine and decrease in strength in lime water and ammonia water.

Strophanthus, Tr.,—Robert A. Hatcher,—Jr. Am. Med. Assn., 1907, Vol. 48, p. 1177.

No deterioration found in tincture even after sixteen years. The seeds do not undergo deterioration in keeping for several years.

Strophanthus, Tincture of,—A. R. Cushny,—Br. Med. Jr., 1912, Vol. II, p. 685.

Tinctures of *digitalis*, *squill* and particularly *strophanthus*, deteriorate rapidly after dilution with water.

Sydenham's Laudanum, The Preparation and Preservation of,—M. Debourdeaux,—Jr. Pharm. Chim., Series 7, Vol. 6, p. 544; through Chem. Absts., 1913, Vol. 7, p. 2093.

After storing, showed a loss of 6% of its morphine which was not found in the precipitate. After one year there was an additional loss of 10%. A 3½ year old tincture had lost 17%, and one 20 years old, 44%.

Tinctures, Do they Deteriorate with Age?—Drug. Cir., 1913, Vol. 57, p. 389; reprinted from the Chem. Drug.

A discussion of various preparations as to stability.

Tincture Iodine,—H. Wastenson,—Svensk. Farm. Tidskrift., Vol. 17, pp. 68, 81, 113; through Chem. Abst., 1913, Vol. 7, p. 1952.

Increase of HI determined in a number of tinctures at intervals during eight weeks. KI retards deterioration.

Tincture of Iodine,—E. H. Gane,—Am. Drug., 1904, Vol. 44, p. 39.

Impurities in alcohol cause deterioration. With good alcohol the loss is about 1% of I in one year.

Tincture of Iodine,—C. H. LaWall,—Proc. Am. Phar. Assn., 1907, Vol. 55, p. 156.

The U. S. P. VIII tincture is a stable preparation under practically all conditions.

Tincture of Iodine,—L. F. Kebler,—Jr. Am. Phar. Assn., 1913, Vol. II, p. 514; also Jr. Ind. Eng. Chem., Vol. 5, p. 484.

Attention is called to the preservative effect of KI and the variation in samples examined. The limit of permissible variation is discussed.

Tincture of Iodine, Alteration on Standing,—C. Courtot,—Jr. Pharm. Chim., Series 7, Vol. 1, pp. 297, 354; through Chem. Absts., 1911, Vol. 5, p. 564.

Three experimental tinctures were examined monthly for one year. The iodine decreased from 67.5 gm. per liter to 54.6, 54.6 and 58.4 gms. respectively.

Tincture of Iodine, Changes in, on Storage, etc.,—Th. Budde,—Apoth. Ztg., Vol. 27, p. 203; through Chem. Absts., 1912, Vol. 6, p. 1493; also Pharm. Ztg., 1912, Vol. 57, p. 176; through Jr. Am. Phar. Assn., Vol. 1, p. 881.

Loss amounts to 20% in 9 months retarded by addition of KI or NaI, but noticeable nevertheless after six months.

Tincture of Iodine, D. A. B.—V. Weiblit,—Phar. Ztg., Vol. 57, p. 734; through Chem. Absts., 1913, Vol. 7, p. 535.

Free iodine content with age increases materially. Limits of variation are needed.

Tincture of Iodine, Influence of Light and Air,—C. Hugenholtz,—Phar. Ztg., 1907, Vol. 52, p. 222; through Proc. Am. Phar. Assn., Vol. 55, p. 697.

Deterioration is greater if kept in full bottles protected from light.

Tincture of Iodine—Influence of Temperature and Light, etc.—C. Courtot,—Jr. Pharm. Chim., Series 7, Vol. 2, p. 344; through Chem. Absts., 1911, Vol. 5, p. 2525.

Changes shown in tinctures of the French Codex 1908. Light has no influence, but temperature affects change.

Tinctures of Iodine, Observations on Commercial,—Agnes Dunning and L. E. Sayre,—Am. Drug., 1909, Vol. 55, p. 211.

An investigation of the effect on different kinds of stoppers. With cork stoppers there is progressive concentration.

Tincture of Iodine Therapeutically Considered,—C. Courtot,—Jr. Pharm. Chim., Series 7, Vol. 1, p. 439; through Chem. Absts., 1911, Vol. 5, p. 1492.

There is concentration with age by evaporation.

Tincture of Iodine, The Stability of Free Iodine in,—Droste,—Pharm. Ztg., Vol. 57, p. 166; through Chem. Absts., 1913, Vol. 7, p. 215.

The alkalinity of glass container responsible for loss.

Tincture of Iodine, U. S. P. VIII,—Theo. D. Wetterstroem,—Proc. Ohio State Pharm. Assoc., 1908, p. 52; through Proc. Am. Phar. Assn., Vol. 57, p. 115.

KI retards change. Strength increases by evaporation.

Tinkturen, Ueber die Zweckmässigkeit von Perkolation oder Maceration zur Herstellung von,—J. Herzog,—Ber. d. Deutsch. Phar. Ges., 1906, Vol. 16, p. 359.

Discusses the influence of air, light and temperature on tinctures.

Tinctures and "Alcoolatures," A Comparative Study of the Active Principles in Some,—E. Dejean,—Jr. Pharm. Chim., Series 6, Vol. 29, p. 274; through Chem. Absts, 1909, Vol. 3, p. 1909.

Attention is called to loss of alkaloid in drugs during drying and the resulting lack of activity in tinctures made from them as compared with "mother tinctures" from green plants.

Wild Cherry Bark, Valuation of,—A. B. Stevens,—Proc. Am. Phar. Assn., 1896, Vol. 44, p. 215. Differences in assay point to deterioration.

Wild Cherry Bark,—A. B. Stevens,—Proc. Am. Pharm. Assn., Vol. 47, p. 184.

Deterioration shown by assays at intervals of one year.

Wild Cherry, Deterioration of Syrup of,—J. Graham French,—Proc. Penna. Pharm. Assn., 1912; through Am. Jr. Pharm., 1913, Vol. 85, p. 82.

Hydrocyanic acid disappears within 3 or 4 months.

THE PHARMACIST WHO THINKS.

The pharmacist who stands around and *thinks* is a better business man than the one who spends every working hour in detail work. The profitable business is made by successfully utilizing the labor of others. A man's powers for personal effort are limited; he must depend upon others to help him. His task is to derive a profit from the labor of those he employs. To do this he must have leisure to plan, to watch, to oversee and direct. He must not occupy his mind so that he cannot do this. The minute that a business man permits the details of his business to master him, he loses the mastery of his business. He ceases to progress. Instead of being the driver of the engine, he becomes only a wheel in the machine. He loses the power to guide and bends his efforts simply to keep it moving.—*The Spatula*.

Section on Pharmacopoeias and Formularies

Papers Presented at the Sixty-First Annual Convention

A VOLUMETRIC METHOD FOR THE ESTIMATION OF MERCURY IN SOME OF ITS COMPOUNDS AND PREPARATIONS.

CHARLES H. LAWALL, PHILADELPHIA.

The estimation of mercury in its salts and compounds is accurately accomplished by several methods of accepted value, such as the sulphide precipitation method and the electrolytic method. Both of these methods, however, are open to certain serious objections, such as regards special apparatus and familiarity with the technique in the electrolytic method or of tediousness and the necessity of working with hydrogen sulphide in the other method. Some time ago a volumetric method was tried based upon the fact that mercury in certain of its compounds, combines with potassium sulphocyanate in molecular proportions, and the results have been so uniformly satisfactory that the method has been adopted as a means of estimating such of the compounds of mercury to which it is applicable in the U. S. P. IX.

Those to which it is applicable are all compounds except the halogen salts. The procedure is very simple, as is illustrated by the following as applied to metallic mercury.

"Weigh accurately about 0.4 gm. of mercury, dissolve it in a mixture of 10 cc. of nitric acid, warm the solution gently until red fumes cease to be evolved and the solution is colorless, and add 150 cc. of distilled water. Then add 2 cc. of ferric ammonium sulphate T. S. and titrate with tenth normal potassium sulphocyanate V. S. to the production of a permanent red color. Each cubic centimeter of tenth normal potassium sulphocyanate V. S. used corresponds to 0.01003 gm. of mercury."

The end point is very satisfactory and the entire operation consumes but a small fraction of the time required by either of the other methods and shows satisfactory results when employed in comparison with them.

The application of the method to such compounds as the oxides of mercury, both red and yellow, is very simple, as they only require to be dissolved in nitric acid as in the foregoing detailed method, using 0.5 gm. of the sample instead of 0.4 gm. as there directed.

Such preparations as the Mass of Mercury and Mercury with Chalk may also be assayed by simple solution of a weighed amount of the preparation in nitric acid and the dilution with water and titration as stated above.

It is believed that this method will fill a long felt want among analysts who frequently have occasion to determine percentages of such mercury compounds as can be determined by this method.

A PHARMACOPŒIA FOR THE PHYSICIAN AND THE DISPENSING DRUGGIST.

H. L. CHAMBERS, M. D., UNIVERSITY OF KAN.

In my former paper¹ it was shown that the physicians now in actual practice are not reading the Pharmacopœia, an effort was made to show *why* they are not reading it, and arguments were adduced to show that they never will read it in its present form.

Considering the Pharmacopœia as it is now, the work of the physician as it is now and making allowance for the changes in his work that are sure to come in the next few years, it is impossible to believe that its study would have much cultural value for the physician, or that it would make his work in any appreciable degree more safe or more successful. It is equally impossible to see how such study could benefit the retail druggist, by making his work easier, safer, more effective, or more remunerative. One may now well inquire whether it is worth while to make any further attempt to get the physicians to read *the* Pharmacopœia, or to read *a* pharmacopœia. Personal interviews with acquaintances do not give any encouragement to efforts toward securing a wider reading of the present volume, but do give more or less enthusiastic support to the idea of a radical modification of its subject matter. The more recent the schooling, the more indifferent to the Pharmacopœia was my observation on the practitioners whom I interviewed. One who is fresh from Rush did not recognize it as a useful book at all, and gave expression to the idea that it has no place in fundamental education, but expects to read it in later years as part of the finishing process. Another whose fundamental medical education was acquired in Baltimore and New York, with side trips to Germany and Philadelphia, does not believe the present work meets any important want in present day medical education, but is not so shameless about his neglect of it as is the very recent Rush graduate.

Interviews with druggists of the younger and liver (pronounced liver) sort convince me that they are not satisfied with the subject matter of the present Pharmacopœia, and that they would favor any change that would better meet the needs of their work as druggists, or would tend to bring themselves and the practitioners nearer together again. They argue with apparent soundness that reading the same well designed book would do much to promote mutual understanding and mutual helpfulness. The public interest would also be conserved by such a condition of things in the respect that better service would be rendered.

Various schemes have been proposed as tending to correct inadequacies as we now have them, but the medical profession has not had sufficient interest to take a very active part in the discussions. Personally, I should like to place my influence in favor of a multiple pharmacopœia—not the original notion of multiple district or hospital pharmacopœia, with one national one, but multiple pharmacopœias each of which shall be national, and at least one of which should

¹JOURNAL for May, 1913, p. 572.

eventually become international. I ask for this on the ground that the material that should go into a pharmacopœia, is so varied and so extensive that one volume cannot well contain it. Also on the ground that its completeness which is essential, would tend in many cases to cover up and obscure the very information any given searcher would want, and hence for this reason, its information should be classified and separated.

Since the U. S. P. is used as a guide in the administration of the various Pure Food and Drugs Laws, it seems important that we have an authoritative book of standards and tests by which to standardize and test the various foods and drugs. Personally, I see no objection to including many articles that are not used as either food or medicines. Fuels, paints, lubricants, and illuminants might very well be included in this book of standards. Eventually all substances whose chemistry has any scientific, economic, or commercial importance would be recognized and standardized in this book, and the book itself would logically become an international one, at least in so far as the substances in common use are concerned.

In this scheme the second pharmacopœia would be the book of chief interest to real pharmacists, since it would have to do only with pharmacy. It should discuss the source, identification, collection, preparation and preservation of medicinal substances. It should be so full and explicit in all the lines mentioned that any competent pharmaceutical chemist could produce as good preparations as any other. We should then hear no more of the "active principle of calomel," of the "special potency" of somebody's blue iron (?) or of the superiority of some other man's viburnum, because this particular pharmacopœia would tell every manufacturing pharmacist how to get good calomel and blue iron (?) and would be so minute in its directions about the selection, care, manufacture and preservation of viburnum that all good houses would have products containing whatever merit may be found in the drug at its best. With such a set of pharmacopœias as is here contemplated in actual existence, it would be easier to cut the humbug out of some present day pharmacy and to teach the medical profession to order preparations according to their merit.

The third pharmacopœia should be one designed for the guidance of the physician and the dispenser, and since they both are in relation to the patient, and are supposed mutually to assist and to check each other, this volume should contain the matters necessary for the guidance of both. It should contain little or no information which is to be found in either of the other volumes, for the reason that such information is not of common use to either the physician or the dispensing pharmacist and would only make their particular pharmacopœia cumbersome; e. g., the doctor prescribes and the druggist dispenses morphine sulphate in some combination, and neither of them is interested in the natural history of the poppy or the political history of opium, and neither of them will make any tests to determine whether the stuff dispensed is what was really ordered. *ergo* leave out the natural history and the tests.

I pause here and open the present Pharmacopœia at random,—happening on pages 176 and 177. The article beginning on the left hand page tells how to make Fluidextract of Colchicum Seed and the one beginning on the right hand page tells how to make Fluidextract of Conium. Neither article contains a

single thing of interest to a physician or dispensing pharmacist. Neither of these men will attempt to make either preparation, for neither has the personal skill nor the apparatus.² Is it not high time to abandon the erroneous notion that the dispensing druggist does or can manufacture the preparations that he uses? It seems to me that the articles cited above have the same relation to the work of the dispenser that a carefully prepared and scientifically correct article on the preparation of steel and the manufacture of hæmostatic forceps would have to the minor surgery that I undertake. If you agree with me, as I think you must, that the present Pharmacopœia is of almost no use at all to the physician and to his dispensing pharmacist, let us ask what would be of use to them. There are five points concerning each preparation that I think are of vital interest and importance to these men, and I mention them serially but not necessarily in order, for their order of relative importance will vary with the different drugs. They are: 1. Preservation. 2. Incompatibility. 3. Physiological action (including toxicology). 4. Therapy. 5. Synergism.

1. No physician desires his prescriptions compounded with dead or deteriorated drugs, and no self-respecting pharmacist is one whit behind the doctor in his effort for active and accurate preparations. Hence, the importance of directions for the preservation of the preparations and the suggestions of tests, the more obvious the better, whereby one may detect deterioration. 2. Both are alike interested in incompatibility, and their pharmacopœia should mention the chemical and physiological incompatibles. 3. Before one should prescribe or another dispense any drug, he should have an accurate idea of what it will probably accomplish when properly exhibited. The physiological, or toxicological action of a drug, seems to me to be the real focus of its study and should be given large room in the pharmacopœia of the men who are responsible for the application of drugs to patients. It necessarily includes full discussion of the amount, manner, and frequency of the dosage, size, age, sex, and other special conditions of the patient. It is important for the dispenser, because he is supposed to act as a check on the prescriber. Also, (pardon me while I feel gently over a sore spot) the dispenser, who usually prescribes more or less for common and trivial ailments, will do this more safely and successfully if he knows more physiological action. 4. This book should discuss therapy for the reason that this is the end or aim of the whole line of study. The physician will have the greater interest in this part of the book, but the dispensing pharmacist will be a better and safer helper and checker if he, too, reads the section along with the one on physiological action. A little more knowledge on these points would probably steady and mayhap save morally whole the druggist when he is tempted to prescribe for conditions not well understood by him; i. e., a little more learning may be expected to increase his sense of responsibility and lessen his own confidence, thereby making him safer. 5. The synergism of drugs is rarely discussed in any serious or systematic way, but should have due consideration in the doctor's and dispenser's pharmacopœia. If a drug acts more kindly or effectively in combination than alone, say so, and say why. A better disseminated information on this line would save us all from

²The editor can not assent to this as a statement of fact so far as it relates to the fairly qualified pharmacist.

the temptation to try out the wonderful "special" preparations that each house puts out—those whose promise always so far outruns their performance. In practice, the ideas of synergism and correction are often allowed to crystallize into ready made prescriptions, and I suppose every large hospital in the world has its prescriptions mainly made up and carried in stock. For routine work they are made to answer whether they *exactly* fit the case or not. I am not favorable to this sort of thing in private practice, but do think that some study along this line would improve both the prescribing and the dispensing.

Allow me to make some suggestions about how the proposed book should be arranged.

1. The classification should be made on the active portions of the drugs; e. g., there should be a careful article on tannic acid, and under this in smaller type there should be short paragraphs on blackberry, kino, catechu, gambir, etc., giving the special features and uses of each. 2. The arrangement should be alphabetic, the unimportant drugs being mentioned merely to refer to the page of the subsidiary paragraph as indicated above. 3. There should be a long section of the book devoted to therapeutics, in which little or no mention is to be made of any special disease. The classification here should be by *indications* and the arrangement alphabetical. Let me suggest a few topics: To destroy bacteria, on the skin, in the tissues, in the alimentary canal, in the nose and throat, in the dejecta, in a room, etc., to raise blood pressure, to lower blood pressure, to lessen motor excitability, to lessen sensory excitability, to improve nutrition, to lower body temperature, to lessen perspiration, to produce sleep, etc. with perhaps more specific directions for drug combat of a few special bacteria and protozoa like streptococcus pyogenes, bacillus of tuberculosis and the organism of malaria. 4. The substances treated should include all those used in the practice of medicine in the United States. When a preparation is not controlled by tests that guarantee its constancy, say so, and when its chief claim to confidence is its mystery or its advertising, say that. 5. The style of the book throughout should be dogmatic on all matters that are well established and well known. On those well established and not so well known there should be some citation of important or fundamental papers. On matters of importance that are still in doubt there should be considerable of experience quoted and arguments epitomized, so that the reader may be allowed to assist in finding the correct conclusions.

Let me claim in conclusion that this scheme would make everybody happy by giving to each the help and inspiration to thought and growth beyond anything the present pharmacopoeia can do; viz, the chemist would have his authoritative book of standards and tests tending soon to establish a uniform nomenclature, so that "pure white lead," e. g. would be the same everywhere, the manufacturing pharmacist would have in his book the alleged private information that so many houses now claim to keep so carefully guarded, and the physician and the dispensing druggist would have in their book the information that would enable them to work with more certainty and satisfaction to themselves and to give better service to the public.

Section on Education and Legislation

Papers Presented at the Sixty-First Annual Convention

PHARMACY LAWS PROPOSED, ENACTED OR AMENDED DURING 1912-1913.*

FRANK H. FREERICKS.

AMENDMENT TO CONNECTICUT PHARMACY LAW.

Section 1. Section twelve of chapter 216 of the public acts of 1909 is hereby amended to read as follows: Said commission shall have power to investigate all alleged violation of the pharmacy law and all laws relating to the dispensing or sale of drugs, medicines, intoxicating liquors under a druggist's license or poisons, or the practice of pharmacy, which may come to its notice, and when there appears reasonable cause therefor, and on reasonable notice to the person accused of such violation, to take and hear testimony with reference thereto; to bring the same to the notice of the proper prosecuting authorities, or said commission may further examine into all cases of alleged abuse, fraud, or violations of the laws relating to the sale of intoxicating liquors and incompetence and may suspend the license of any licensed pharmacist or assistant pharmacist, and may revoke the license of any person convicted of violating any provision of this act.

Sec. 2. Section sixteen of chapter 216 of the public acts of 1909 is hereby amended to read as follows: Nothing herein shall prevent a practicing physician from compounding or dispensing his own prescriptions; or prevent the sale of insecticides; or prevent the sale of patent or proprietary medicines which do not conflict with the act concerning the sale of narcotic drugs; or prevent the sale of any drugs, medicines, or poisons at wholesale; or prevent any person from becoming a partner in or the owner of a pharmacy conducted by a licensed pharmacist; or prevent any keeper of a country store from keeping for sale and selling such domestic remedies as are usually kept and sold in such stores, except the following, viz.: Opium, morphine, and all other derivatives of opium, preparations containing opium in excess of two grains per ounce or morphine in excess of one-fourth grain per ounce, carbolic acid stronger than 10 percentum solution, prussic acid, oxalic acid, strychnine, arsenic, cyanide of potassium, chloral hydrate, chloroform, cobalt, sugar of lead, mercury in any form, belladonna and its preparations for internal use, and nux vomica and its preparations provided such keeper shall not compound medicines, and provided that when sold in such stores all medical preparations recognized by the United States Pharmacopoeia and National Formulary shall be of standard strength, and shall be prepared by a licensed pharmacist, and shall be sold only in original packages bearing the label of a licensed pharmacist.

Approved June 6, 1913.

*Continuation of the report of the secretary of the Section on Education and Legislation. See Journal for Dec., 1913.

DEFEATED ILLINOIS PHARMACY BILL.

Section 1. That it shall be unlawful for any person not a registered pharmacist within the meaning of this Act to open or conduct any pharmacy, dispensary, drug store, apothecary shop or store, for the purpose of retailing, compounding or dispensing drugs, medicines or poisons, and any person violating the provisions of this section shall be liable to a penalty of not less than twenty nor more than one hundred dollars for every such violation: Provided, however, that nothing in this Act shall prevent any person or persons owning a drug store or pharmacy, who shall employ and place in active and personal charge of the same, a registered pharmacist, and that nothing herein contained shall apply to nor in any manner interfere with the practice of any physician, or prevent him from supplying to his patients such articles as may seem to him proper, nor with the exclusive wholesale business of any wholesale druggist: Provided, that nothing contained in this Act shall apply to the sale of patent or proprietary preparations which do not contain cocaine, alpha or beta eucaine, morphine, opium, heroin, chloroform, cannabis indica, chloral hydrate or acetanilid or any salt or compound or any derivatives or preparations of the foregoing substances, when sold in original and unbroken packages.

Sec. 4. Any person shall be entitled to registration as a registered pharmacist who is of the age of twenty-one years or over, of good moral character and temperate habits, and who shall have passed a satisfactory examination before the board of pharmacy.

Every applicant for examination as a registered pharmacist must furnish proof of four years' experience under a registered pharmacist in compounding drugs and medicines in drug stores where the prescriptions of medical practitioners are compounded. Actual time of attendance, but not to exceed two years, at any recognized school of pharmacy, college of pharmacy or department of pharmacy of a university, may be accredited on the above required service under a registered pharmacist: Provided, that applicants are able to show by proper certificate from the school of pharmacy, college of pharmacy or department of pharmacy of the university which they have attended that their school work was satisfactory.

Every applicant for examination as a registered pharmacist who was not registered by said board of pharmacy as an apprentice or as an assistant pharmacist prior to the taking effect of this amendatory Act must furnish proof of having graduated from a school of pharmacy, college of pharmacy, or department of pharmacy of a university that is recognized by said board.

The board of pharmacy may, in its discretion, grant certificates of registration as a registered pharmacist to such persons as shall furnish with their applications satisfactory proof that they are graduates from a school of pharmacy, college of pharmacy or department of pharmacy of a university that is recognized by said board and that they have been registered by examination in some other state: Provided, that such other state shall require a degree of competency equal to that required of applicants in this state.

Every applicant for registration as a registered pharmacist shall pay to the secretary of the board the sum of ten dollars at the time of filing the application.

The payment of said sum of money, as aforesaid, shall entitle the applicant to take a second examination, in case he failed in the first, but no more: Provided, said second examination is taken within six months after the first; and upon the payment of an additional five dollars, in case the applicant passes a satisfactory examination, the secretary of the board of pharmacy shall issue to him a certificate as a registered pharmacist.

The state board of pharmacy shall make rules to establish a uniform and reasonable standard of educational requirements to be observed by schools and colleges of pharmacy or pharmacy departments of universities, and said board may determine the reputability of such schools, colleges and departments of pharmacy by reference to their compliance with such rules.

Sec. 5. Any person shall be entitled to registration as a local registered pharmacist and shall be deemed a registered pharmacist within the meaning of this Act who is of the age of twenty-one years or over, of good moral character and temperate habits, and who shall have passed a satisfactory examination before the board of pharmacy.

Every applicant for examination as a local registered pharmacist must furnish proof of four years' experience under a registered pharmacist in compounding drugs and medicines in drug stores where the prescriptions of medical practitioners are compounded. Actual time of attendance, but not to exceed two years, at any recognized school of pharmacy, college of pharmacy or department of pharmacy of a university, may be accredited on the above required service under a registered pharmacist: Provided, that applicants are able to show by proper certificate from the school of pharmacy, college of pharmacy, or department of pharmacy of the university which they have attended that their school work was satisfactory.

Every applicant for examination as local registered pharmacist who was not registered by said board of pharmacy as an apprentice or as an assistant pharmacist prior to the taking effect of this amendatory Act must furnish proof of having graduated from a school of pharmacy, college of pharmacy, or department of pharmacy of a university that is recognized by said board.

Every applicant for registration as a local registered pharmacist shall pay to the secretary of the board the sum of ten dollars at the time of filing the application. The payment of said sum of money, as aforesaid, shall entitle the applicant to take a second examination in case he failed in the first, but no more: Provided, said second examination is taken within six months after the first; and upon the payment of an additional five dollars, in case the applicant passes a satisfactory examination, the secretary of the board of pharmacy shall issue to him a certificate as a local registered pharmacist. Said certificates shall be operative in and apply to the village, town, city, place or locality for which granted, and no other.

Provided, that no local registered pharmacist certificate shall be granted under this section for any village, town, or city, the population of which exceeds 500, according to the federal census next preceding.

Provided, further, that any and all persons holding registered pharmacist time service certificates heretofore issued may have the same renewed from year

to year in the same manner and under the same conditions as are provided herein for the renewal of registered pharmacist certificates.

Sec. 2. No person shall sell at retail any drug, medicine or poison without affixing to the box, bottle, vessel or package containing the same a label bearing the name of the article distinctly shown, with the name and place of business of the registered pharmacist from whom the article was obtained: Provided, that nothing in this section shall apply to the sale of patent or proprietary preparations which do not contain cocaine, alpha or beta eucaïne, morphine, opium, heroin, chloroform, cannabis indica, chloral hydrate or acetanilid, or any salt or compound or derivative of the foregoing substances, when sold in original and unbroken packages, nor with the dispensing of prescriptions of licensed physicians, licensed dentists or licensed veterinarians, nor with the sale of paris green or lead arsenate or other poisonous substances or mixtures of poisonous substances in unbroken packages, for use in the arts or insecticide purposes: Provided, that they bear a label with the name or names of such poisonous substances and the word "poison" printed thereon in prominent type and the names of at least two readily obtainable antidotes with directions for their administration. Every proprietor or manager of a drug store or pharmacy shall keep in his place of business a suitable book or file, in which shall be preserved for a period of not less than five years, the original of every prescription compounded or dispensed at such store or pharmacy, numbering, dating and filing them in the order in which they were compounded, and shall produce the same in court or before any grand jury whenever thereto lawfully required. Said book or file of original prescriptions shall at all times be open for inspection by duly authorized officers of the law. Any person failing to comply with the requirements of this section shall be liable to a penalty of \$5 for any and every offense.

Sec. 12a. No person shall sell any drug, medicine, medicinal preparation or ointment containing any morphine, opium, heroin, chloroform, cannabis indica, chloral hydrate or acetanilid, or any salt or compound or any derivative or preparation of such substances without affixing to the bottle, box, vessel or package containing the same and upon the outside wrapper of the package as originally put up, a label distinctly displaying the name and quantity in grains or minims in each ounce of each of the substances mentioned in this section, their salts, compounds or derivatives, with the name and place of business of the manufacturer: Provided, that nothing contained in this section shall apply to the dispensing of the prescriptions of licensed physicians, licensed dentists or licensed veterinarians. Any person violating the provisions of this section shall be deemed guilty of a misdemeanor and on conviction shall be punished by a fine of not less than twenty dollars and not more than one hundred dollars for each offense.

Sec. 12b. It shall be unlawful for any person to prescribe for, sell, retail, give away, or furnish to any habitual user of the same, knowing him to be such, any morphine, opium, heroin, chloroform, cannabis indica, chloral hydrate, or acetanilid, or any salt or compound of said last named substances, or any preparation containing said last named substances, or their salts or compounds: Provided, any licensed physician may, in good faith, prescribe or furnish for the use of any habitual user of said drugs who is under his professional care such

substances as he may deem necessary for his treatment when such prescriptions are not given or substances furnished for the purpose of evading the provisions of this Act. Any person violating the provisions of this section shall be deemed guilty of a misdemeanor and on conviction shall be punished by a fine of not less than twenty dollars and not more than one hundred dollars for each offense.

Sec. 13. Any person who shall willfully make any false representation to procure registration for himself or any other person or who shall make false representation as to his registration as an apprentice, assistant pharmacist or registered pharmacist shall be deemed guilty of a misdemeanor and on conviction shall be fined not less than fifty dollars nor more than one hundred dollars for each and every offense.

Sec. 14a. It shall be unlawful for any druggist or other person to retail, sell or give away any cocaine, alpha or beta eucaine, or any salt or any compound, or derivative of any of the foregoing substances, or any preparation or compound containing any of the foregoing substances, or any of their salts or compounds, or derivatives, except upon the written prescription of a duly registered physician, licensed dentist or licensed veterinarian, which prescription shall contain the name and address of the person for whom prescribed (or if prescribed by a licensed veterinarian shall state the kind of animal for which prescribed and the name of the owner thereof) and the date the same shall have been filled, and shall be permanently retained on file by the person, firm or corporation, where the same shall have been filled and it shall be filled but once, and of it no copy shall be given to any person, and the original bill shall at all times be open to the inspection of the prescriber, to the state board of pharmacy, and all officers of the law; except, however, that such cocaine, alpha or beta eucaine, or any salt, or any compound, or any derivative of the foregoing substances, or any preparation or compound containing any of the foregoing substances, or any of their salts or compounds, or derivatives, may lawfully be sold at wholesale upon the written order of a licensed pharmacist, or licensed druggist, duly registered practicing physician, licensed veterinarian or licensed dentist: Provided, that the wholesale dealer shall affix or cause to be affixed to the bottle, box, vessel or package, containing the article sold, and upon the outside wrapper of the package as originally put up, a label, distinctly displaying the name and quantity of cocaine, alpha or beta eucaine, or any salt or compound, or derivative of any of the foregoing substances, sold, and the word "Poison" with the name and place of business of the seller, all printed in red ink. And, provided, also, that the wholesale dealer shall, before delivering any of the articles, make or cause to be made in a book kept for that purpose, an entry of the sale thereof, stating the date of sale, the quantity, name and form in which sold, the name and address of the purchaser, and the name of the person by whom the entry is made; and the said book shall be always open for inspection by the proper authorities of the law, and shall be preserved for at least five years after the date of the last entry made therein.

It shall be unlawful for any person to have in his or her possession at any one time any cocaine, alpha or beta eucaine, or any salt or any compound, or any derivative of any of the substances mentioned in this sentence, unless it was

obtained by means of a prescription of a licensed physician, licensed dentist or licensed veterinarian: Provided, that the above provision shall not apply to registered pharmacists, licensed physicians, licensed dentists, licensed veterinarians, jobbers, wholesalers and manufacturers of drugs and medicines, or retail druggists or hospitals.

Sec. 15b. It shall be the duty of the board of pharmacy to procure full sets of weights, balances and measures used in compounding drugs, medicines and poisons, which it shall cause to be tried, proved and sealed by the state or United States standards, under the direction of the secretary of state, or bureau of standards of the United States government. The board of pharmacy shall have the power to inspect all weights, balances and measures used by retail druggists in compounding drugs, medicines and poisons, and shall have the power to enforce the keeping and use of proper weights and measures. Any person or persons failing to keep and use standard weights, balances and measures, as provided by the board of pharmacy, shall be guilty of a misdemeanor and upon conviction thereof shall be fined not less than ten (\$10) nor more than fifty dollars (\$50) for each and every offense.

NOTE—This bill was amended before its final defeat by striking out wherever they appear, the words "acetanilid, chloroform, Cannabis Indica, heroin, chloral hydrate, morphine and opium."

KANSAS PHARMACY LAW, AS ENACTED AFTER AMENDMENT.

Section 1. It shall be hereafter unlawful for any person within the State of Kansas to open or conduct any drug store, pharmacy, retail store, shop or other place of business for retailing, dispensing or compounding medicines or poison, or to retail, except as is provided in chapter 70 of the General Statutes of Kansas of 1909, any drug, or medicinal preparation or any article containing the same for medicinal use, or dispense or compound any medicine or poison, unless such person be a registered pharmacist or under the supervision of a registered pharmacist within the meaning of this act. And it shall be unlawful for any person to compound or dispense any physician's prescriptions unless such person be a registered pharmacist or an assistant registered pharmacist within the meaning of this act, except as hereinafter provided. The term "medicine," as used in this act shall include all medicines and preparations, and any substance or mixture of substances intended to be used for the cure, mitigation or prevention of diseases of man; provided, none of the provisions of this act shall apply to or be construed to affect in any way the sale of patent or proprietary medicines or flavoring extracts, nor in any way interfere with, limit or repeal the provisions of chapter 70 of General Statutes of 1909.

SEC. 2. Any person who may desire a certificate as a registered pharmacist, shall apply for examination to the board of pharmacy, and shall pay the secretary of the board the sum of five dollars. If the board shall find that he has had practical experience for four years in compounding physicians' prescriptions, in the general duties of pharmacy, and has had at least one year of high school work or its equivalent, and otherwise duly qualified, they shall duly register him and issue him a certificate as registered pharmacist. In case of failure to pass a satisfactory examination, second examination may be granted within six months without further payment.

SEC. 3. Pharmacists registered as herein provided and dispensers of medicine shall have the right to keep and sell, under such restrictions as herein provided, all drugs, medicines and poisons authorized by the National Formulary, the United States Pharmacopoeia and other standard pharmaceutical and medical works of recognized utility; provided, that nothing herein contained shall be so construed as to shield any apothecary or pharmacist who violates or in any way abuses this trust for the legitimate and actual necessities of medicine, from the utmost rigor of the law relating to the sale of intoxicating liquors, morphine, cocaine or chloral, and upon the conviction of any violation of the prohibitory law, or of this law, his name shall be stricken from the register, and in addition thereto shall be fined not less than one hundred dollars nor more than three hundred dollars, and not less than thirty days nor more than ninety days in jail, or both such fine and imprisonment. It shall be unlawful for any person, on and after the passage of this act, to retail any articles enumerated in schedules A, B and C, except as provided in sections 1 and 4.

Schedule A. Arsenic and its preparations, corrosive sublimate, white precipitate, red precipitate, biniodide of mercury, cyanide of potassium, hydrocyanic acid, chloroform, strychnine, and all other poisonous vegetable alkaloids and their salts, and essential oil of bitter almonds, or opium and its preparations, excepting paregoric and other preparations of opium containing less than two grains to the ounce; or other habit-producing drugs, or preparations containing same having same effect.

Schedule B. Aconite, belladonna, colchicum, conium, nux vomica, henbane, cantharides, creosote, digitalis, and their pharmaceutical preparations; croton oil, sulphate of zinc, sugar of lead, mineral acids, carbolic acid, oxalic acid, permanganate of potassium, formaldehyde, and all other virulent poisons, except poison fly-killers, lye, ammonia, Paris green, arsenate of lead, wood alcohol, London purple, commercial poison for rats, mice and bed-bugs, and denatured alcohol when sold in sealed packages and plainly labeled "Not for Medical Use, Poison," may be sold through the regular channels of trade.

Schedule C. Oil of savin, oil of tansy, ergot and its preparations, cotton root and its preparations, and all other active emmenagogues or abortives.

SEC. 4. Articles enumerated in schedules A and B shall not be sold without distinctly labeling the box, vessel or paper in which said poison is contained; also the outside and inside wrapper or cover, with the name of the article, the word "poison," and the name and place of business of the seller. Nor shall it be lawful for any person to sell or deliver any poison enumerated in schedules A and B unless upon due inquiry it be found that the purchaser is aware of its poisonous character and represents that it is to be used for a legitimate purpose; nor shall it be lawful for any registered pharmacist or assistant registered pharmacist to sell or deliver any articles included in schedules A and B without, before delivering the same to the purchaser, causing an entry to be made in a book for that purpose stating the date of sale, the article sold, the quantity thereof, the purpose for which it is represented by the purchaser to be required, the name of the dispenser, and the name and address of the purchaser, signed by himself; such book to be always open for inspection by the proper authorities, and to be

preserved for at least five years. No article in schedule C shall be sold except on the prescription of a legally qualified physician. The provisions of this section shall not apply to the sale of poisons in not unusual doses and quantities upon the prescription of licensed practitioners of medicine. All prescriptions of practicing physicians shall be filed and retained by the dispenser, serially numbering, dating and filing the same. Said serial number and date and signature, together with proper directions, shall be placed upon package or container in which said medicine is dispensed. Failure to keep prescription files in accordance with the provisions of this act shall be prima facie evidence of violation of this law. The prescription files of the pharmacist shall be open to inspection by the proper authorities at all times.

SEC. 5. Nothing hereinbefore contained in this act shall prohibit any practitioner of medicine from compounding his own prescriptions and administering or supplying to his patients such articles as may be fit, proper and necessary, provided drugs and medicines dispensed by him shall comply with the Kansas food and drug law and be subject to inspection as provided in said law; and it is also further provided that it shall be lawful for retail dealers to sell the usual domestic remedies and medicines in unbroken packages, not including any article enumerated in schedules A and B of this act, in case such dealer shall procure a license from the board of pharmacy, at a fee of \$2.50 annually, not as a registered pharmacist but as a registered dealer; and said annual fee to be paid within thirty days from the expiration of said license, otherwise said annual fee to be five dollars.

SEC. 6. Every proprietor or conductor of a drug store or pharmacy, and everyone who dispenses from a private stock of drugs, shall be responsible for the quality of all drugs, chemicals and medicines he may sell or dispense; and should he knowingly and fraudulently adulterate or cause to be adulterated such drugs, chemicals or medicinal preparations, he shall be deemed guilty of a misdemeanor.

SEC. 7. That the State Board of Pharmacy is authorized and directed to make and publish uniform rules and regulations not in conflict herewith, which rules and regulations may include, if necessary for the proper execution of this law, the collection and examination of medicines and drugs kept for sale, offered for sale or for dispensing, or sold in the state of Kansas, by any pharmacist, or kept in stock by any physician, merchant or dispenser. Samples thus collected may be submitted for analysis to the drug laboratory established under the Food and Drugs Act, Section 4, Chapter 266, Laws of 1907, and the results of the analysis may be published in the bulletin of the Board of Health, which said rules and regulations shall be published in the official state paper of the state.

SEC. 8. Any person who shall violate any of the provisions of this act, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine not to exceed fifty dollars, or imprisonment in the county jail for not more than six months, or both in the discretion of the court.

SEC. 9. The original Sections 8103, 8104 and 8105 of the General Statutes of Kansas for the year 1909 are hereby repealed. All acts or parts of acts in conflict herewith are hereby repealed.

SEC. 10. This act shall take effect and be in force from and after its publication in the statute book.

MASSACHUSETTS PHARMACY LAW AMENDMENT.

(Chap. 705.)

An Act to Provide for Registering and Licensing Stores for Transacting Retail Drug Business.

Section 1. The term "drug business" as used in this act shall mean the sale of opium, morphine, heroin, codeine or other narcotics, or any salt or compound thereof, or any preparation containing the same, or cocaine, alpha or beta eucaine, or any synthetic substitute therefor, or any salt or compound thereof, or any preparation containing the same, and the said term shall also mean the compounding and dispensing of physicians' prescriptions.

Section 2. No store shall be kept open for the transaction of the retail drug business unless it is registered with and a permit therefor has been issued by the board of registration in pharmacy as herein provided.

Section 3. The board of registration in pharmacy shall, upon application, issue a permit to keep open a store for the transaction of the retail drug business to such persons, firms and corporations as the board may deem qualified to conduct such a store. The application for such a permit shall be made in such manner and in such form as the board shall determine. A permit issued as herein provided shall be exposed in a conspicuous place in the store for which the permit is issued and shall expire on the first day of January following the date of its issue. The fee for the permit shall be one dollar.

Section 4. No such permit shall be issued for a corporation to keep open a store for the transaction of the retail drug business, unless it shall appear to the satisfaction of the said board that the management of the drug business in such store is in the hands of a registered pharmacist.

Section 5. The said board may suspend or revoke a permit issued hereunder for any violation of the law pertaining to the drug business or the sale of intoxicating liquors or for aiding or abetting a violation of any such law; but before suspending or revoking any such permit the said board shall give a hearing to the person firm or corporation holding the permit, after due notice to such person, firm or corporation of the charges against him or it and of the time and place of the hearing. At the hearing, such person, firm or corporation may appear with witnesses and be heard by counsel. Witnesses at all hearings shall testify under oath and any member of the board may administer oaths to witnesses. Any person so sworn or affirming who willfully swears or affirms falsely respecting any matter upon which his testimony is required shall be deemed guilty of perjury. The board shall have power to require the attendance of persons and to compel the production of books and documents. Three members of the board shall be a quorum for such a hearing, but no permit shall be suspended or revoked unless upon the vote of three or more members of the board.

Section 6. For the purpose of enforcing the provisions of this act the board may expend a sum not exceeding one thousand dollars annually.

Section 7. Whoever violates any provisions of this act shall be punished by a fine of not less than five nor more than one hundred dollars, or by imprisonment for not more than thirty days or by both such fine and imprisonment.

Section 8. This act shall take effect on the first day of January, nineteen hundred and fourteen.

Section 9. All acts and parts of acts inconsistent herewith are hereby repealed. (Approved May 27, 1913.)

This bill as passed is the result of several conferences between representatives of the Board of Pharmacy, your Association, the Liggett stores people and the Watch and Ward Society. This is the first measure which has ever been enacted into law which gives the Board of Pharmacy actual supervision over drug stores. It will be possible for the Board under the provisions of this act to close a drug store for any infringement of law pertaining to the sale of drugs or intoxicating liquors. Your committee believes this to be a long step in the right direction.

MINNESOTA PHARMACY LAW AMENDMENT.

Section 1. Creation of State Board, Employment of Attorney, and When Violators shall be Deemed Guilty of a Misdemeanor.—That Section 2327, Revised Laws of 1905, be amended to read as follows:

2327. The state board of pharmacy shall consist of five registered pharmacists of the state, appointed by the governor, each for the term of five years and until his successor qualifies. Vacancies shall be filled by like appointment for the unexpired term. No person connected with any school or college of pharmacy shall be a member of the board, and, if a member become so connected, his membership shall cease. The Minnesota state pharmaceutical association may recommend five names for each appointment to be made, from which list the governor may select. The board shall elect annually one of its members as president, and a registered pharmacist, who may or may not be a member, as secretary. It may employ an attorney and other necessary assistants, and make rules for the conduct of its business. It may, by its duly authorized representative, enter and inspect any and all places where drugs, medicines and poisons are sold, given away, compounded, dispensed or manufactured. Any person refusing to permit or otherwise preventing such duly authorized representatives from entering such places, shall be guilty of a misdemeanor. It shall enforce and obey the provisions of this subdivision, and report its proceedings to the governor annually, with such information and recommendations as it deems proper, giving the names of all pharmacists registered during the year, and the items of its receipts and disbursements.

Sec. 2. Examinations and Fees.—That Section 2329, Revised Laws of 1905, be amended to read as follows:

2329. The board shall meet at least once in every three months to examine applicants for registration and transact its other business, giving reasonable notice of all examinations, by mail, to known applicants therefor. The secretary shall record the names of all persons registered by the board, together with the grounds upon which the right of each to registration was claimed. The fee for examination shall be five dollars. All registered pharmacists and assistants, while employed as such, shall be exempt from service as jurors. On hearing, the board may revoke any certificate of registration obtained by false representation or other fraud, or when the holder is addicted to the liquor or drug habit so as to unfit

him for the practice of pharmacy, and may refuse registration to any person so addicted.

Sec. 3. Qualifications of Applicants.—That Section 2331, Revised Laws of 1905 be amended to read as follows:

2331. An applicant for a certificate as assistant shall be eighteen years old, or over, and have had two years' practical experience in drug stores where physicians' prescriptions are usually compounded. Provided, however, if he be a graduate of a school of pharmacy whose course includes twelve months of laboratory work, but one year's experience shall be required. If upon examination, the board finds him qualified, he shall be registered. His certificate shall entitle him to act as an assistant to a registered pharmacist and to compound and dispense drugs and medicines during the temporary absence of the registered pharmacist.

Sec. 4. Registration of Pharmacists From Other States, and Fees.—That Section 2332, Revised Laws of 1905, be amended to read as follows:

2332. The board, without examination, upon receipt of a fee of twenty-five dollars, may grant registration to any pharmacist licensed or registered by the board of pharmacy, or a similar board, of another state.

Sec. 5. Annual Fees to be Paid.—That Section 2334, Revised Laws of 1905 be amended to read as follows:

2334. Every person registered by the board, while continuing in business, shall annually pay to the secretary a renewal fee, to be fixed by the board, and not to exceed three dollars for a pharmacist and two dollars for an assistant. A person who has once been registered and has defaulted in the payment of fees may be reinstated within two years of such default, without examination, upon payment of arrears. Every certificate and renewal shall expire at a time therein prescribed, not later than one year from its date.

Sec. 6. Definition of Drugs and Exceptions.—That Section 2335, Revised Laws of 1905 be amended to read as follows:

2335. Exceptions as to sale. Drugs, medicines and poisons, for the purposes of this subdivision, shall include all substances commonly kept in drug stores and used in compounding medicines or sold for medicinal purposes. Nothing in the subdivision, however, shall prevent a physician from compounding prescriptions for use in his practice or furnishing to his patients such articles as he deems proper, or interfere with the making or vending of proprietary medicines, with any exclusively wholesale business, or with the sale by general retail dealers of the following articles: Alum, blue vitriol, borax, carbonate of ammonia, carbonate of soda, castor oil, copperas epsom salts, glauher salts, glycerin, gum arabic, gum camphor, licorice, logwood, rolled sulphur, saltpetre, senna leaves, sublimed sulphur, water of ammonia, or paris green in sealed packages distinctly labeled "paris green, poison." Nor shall any dealer whose shop is more than two miles from a drug store be thus prevented from selling any commonly used medicine or poison which has been put up for such sale by a registered pharmacist.

Sec. 7. Physician's Prescriptions Required for Certain Drugs.—That Section 2337, Revised Laws of 1905, be amended to read as follows:

2337. No person, otherwise than on a physician's written prescription, shall sell at retail aconite, belladonna, digitalis, or nux vomica, or their preparations,

the oils of bitter almonds, cedar, pennyroyal, savin, or tansy, arsenic or any of its preparations, mercury or opium, or any of their poisonous preparations, carbolic acid, chloral hydrate, chloroform, creosote, croton oil, cyanide of potassium, hydrocyanic acid, lead acetate, morphine, the mineral acids, oxalic acid, strychnine, wood-naphtha or any other commonly recognized poison, without affixing to the package or receptacle containing the same a label conspicuously bearing the word "poison," and the name and business address of the seller, and satisfying himself that such poison is to be legitimately used. Any person who fails to comply with any requirement of this section shall be guilty of a misdemeanor.

Sec. 8. Register to be Kept For Sale of Poisonous Drugs.—That Section 2338, Revised Laws of 1905 be amended to read as follows:

2338. No person, either on his own behalf or while in the employ of another, except upon the written prescription of a physician, shall sell or give away arsenic or its preparations, (other than paris green), aconite, belladonna, or nux vomica, or their preparations, cyanide of potassium, hydrocyanic acid, morphine, mercury or its poisonous preparations, opium or the tincture thereof, the oils of pennyroyal, savin or tansy, or strychnine, without first recording, in a book kept for the purpose, the name and address to whom and the amount and kind of poison delivered. Every person who shall violate any provision of this section, give a false name to be recorded as aforesaid, or having custody of any such record book, shall refuse to produce it on demand for the inspection of any officer, shall be guilty of a misdemeanor.

Sec. 9. Penalty for Violation by Druggist.—That Section 2339, Revised Laws of 1905 be amended to read as follows:

2339. Every proprietor or manager of a place where drugs are sold shall be responsible for the quality of all drugs, chemicals, and medicines sold by him, except proprietary medicines and other articles sold in the original packages of the manufacturers. Every person who, by himself or through another, shall willfully adulterate any drug, medicinal substance, or preparation authorized, or recognized by the United States Pharmacopeia, or National Formulary, or used or intended to be used in medical practice, or shall mix with any such article any foreign or inert substance for the purpose of weakening its medicinal power and effect or of cheapening it, or who shall sell the same knowing it to be so adulterated or mixed, shall be guilty of a misdemeanor, the minimum punishment whereof shall be a fine of fifty dollars.

Sec. 10. Punishment For Sale by Other Than Druggist.—That Section 2340, Revised Laws of 1905, be amended to read as follows:

2340. No person, not a registered pharmacist, or a dealer employing and keeping such a pharmacist in active charge of his place of business, shall retail, compound or dispense drugs, medicines, or poisons, or keep or conduct a place of retailing, compounding, or dispensing drugs, medicines, or poisons, or falsely assume or pretend to the title of a registered pharmacist. No registered pharmacist or other person shall permit the compounding or dispensing of prescriptions or the vending of drugs, medicines, or poisons in his place of business, except under the supervision of a registered pharmacist or assistant. Every person violating any provision of this section shall be punished by a fine of not less than

fifty dollars, except in cases where the death of a human being results from such violation, when the person offending is guilty of a felony.

Sec. 11. Annual Fees May be Turned Over to State Pharmaceutical Association.—That the state board of pharmacy may each year turn over to the state pharmaceutical association for the advancement of the science and art of pharmacy, out of the annual fees collected by it, such sum, as it may deem advisable, but not to exceed one dollar for each pharmacist and one dollar for each assistant pharmacist, who shall have paid his renewal fee during such year. Said association shall annually report to said board on the condition of pharmacy in the state.

Approved April 28, 1913.

(To be continued)

THE TRADE-MARK EVIL OF MEDICINAL COMPOUNDS.*

CORNELIUS OSSEWARD, PH. G., SEATTLE, WASH.

In this practical age, in which the spirit of mercantilism dominates and absorbs all thought and action, it is not inappropriate for us, in fact it has become a necessity to give our attention to the conditions created by this all absorbing thought of commercialism.

I think it therefore not out of place or time to present to the Association facts which are of such vital importance to ethical pharmacy, facts which have not been looked into as thoroughly as their importance demands, facts which may not be pleasant reading, but that should nevertheless have our undivided and careful attention and consideration.

I refer to the trade-mark evil pertaining not to the definite substances, but to the compound preparations, the mixtures, the ready-made prescriptions, placed on the market under the various trade names.

Much has been written about the so-called patent medicine houses or proprietary houses, but why has there not been more discussion about our ethical pharmaceutical houses?

A careful analysis of the conditions existing will show you clearly that these very ethical pharmaceutical houses are today the greatest offenders in placing on the market compound preparations, mixtures of all kind, ready made prescriptions to be poured from their bottles into your prescription bottles, and this is called the art of dispensing?

Is it any wonder then that we hear the remarks made: "What need for any education in pharmacy? Any one can be a dispenser, no knowledge is required to pour from one bottle into another bottle."

Let us look into these conditions created by these houses and not deny the existence of these evils because their recognition is disagreeable.

In looking over the proceedings of the American Pharmaceutical Association for several years past, we find many articles in regard to dispensing pharmacy.

*Read at the 60th Annual Meeting, Denver, 1912.

Vol. 46, page 438. Mr. Beal, then chairman of this section, in his address said:

"It has not been uncommon of late years to learn from various sources that dispensing pharmacy has about reached the end of its existence as a separate calling, and that forces are now at work which must produce its speedy disintegration, and eliminate it from the list of recognized occupations whereby men may gain a livelihood.

"The question which this prediction suggests is one of supreme importance and may well challenge our serious consideration." Furthermore, he says, "That dispensing pharmacy is at present in a very unsettled and unsatisfactory condition we all agree, but as to the causes of these conditions or as to the remedies which should be adopted for its improvement, there is a wide difference of opinion."

Ex-President Oldberg in his address to this Association, Vol. 57, page 426, of the proceedings says "The chief cause of the degradation of the retail drug business is the ruinously excessive number of drug stores," and he might have added that the excessive desire of the manufacturing pharmaceutical houses to monopolize everything pertaining to pharmacy, even dispensing, under the successful system of trade-mark mixtures has been and is today the greatest hindrance of a more liberal use by the physicians of U. S. P. and National Formulary preparations.

In other words, instead of having the proprietary houses only to flood the market with these compounds, we have now in addition also every ethical pharmaceutical house to prescribe for the physician and to dispense for the pharmacist.

Do you wonder that dispensing pharmacy is in an unsettled and unsatisfactory condition? Let us consider for a moment the results of flooding the market with these many compounds.

What good has been obtained from these trade-mark compounds? Has pharmacy been improved, has there been more scientific knowledge obtained in placing these mixtures on the market?

These are fair questions to ask, but the only benefit derived, as far as I can judge, is by these manufacturers in the shape of dividends at the close of the year.

The disadvantages, however, are many, and of such far reaching consequences, as far as ethical and scientific pharmacy is concerned, that this Association cannot afford to ignore the importance of these unscientific methods.

First, by flooding the market with these various compounds, these ready-made prescriptions, it has caused many physicians to overlook their materia medica and therapeutics, which has not been to the benefit of their patients.

Second, it is, I believe, the direct cause of the physicians doing their own dispensing.

Third, it has encouraged substitution, for the greatest number of these ready-made prescriptions are nothing more or less than substitutions for some popular proprietary remedy.

Fourth, and last but not least, I believe is the most serious result and the one cause which should have our careful attention, for in this case neither the pharmacist nor the public at large is getting a square deal.

Think of the multiple compounds each manufacturer controls through this system of trade-mark compounds, a similar product to replace that of his many competitors.

Look on your shelves today—a dozen one-pint bottles of the so-called ethical cough mixtures from as many different ethical pharmaceutical houses all practically the same, and which could for all practical purposes be done away with or replaced by our National Formulary preparation of Syrup White Pine Compound.

Every one of these cough mixtures have as their most active constituent either morphine, codeine or heroin, the only important difference being the name: Syr. Tolu and Heroin Co.; Expectorozone; Elixir Pinus Co.; Elixir Pinus Co. with Morphine; Elixir Pinus Co. with Codeine; Elixir Pinus Co. with Heroin; Sedatole; Pruno Codeine; Creo Terpin Co.; Red Spruce Codeine Expectorant; Cerose; Heroterpine; Codeine Cough Sedative; Glycerole Heroine Co.; Syr. Cocillana Co.; Anodyne Pine Expectorant; Anodyne Pine Expectorant with Heroin, and many others of a similar nature.

And this pertains only to the cough mixtures; other compounds, too many to mention, are found in every drug store to be dispensed as called for.

Now the important question arises, what condition are these compounds or complex mixtures in after standing on your shelves for an indefinite time through the various changes of temperature, especially in our warm climates?

Does it seem reasonable to expect that these complex mixtures will remain unaltered under these changeable conditions?

Some of these manufacturers admit themselves that changes are liable to occur, for on the bill head of a certain firm may be found the following notice in red ink:

"We cannot undertake to accept for credit or exchange broken or open packages where stoppers (caps or corks) have been removed or seals broken, but will exchange any of our preparations, in original or unbroken packages, which may have undergone changes from causes impairing their efficacy."

I ask you in all candor is the public getting freshly prepared medicine when we positively know that these compounds which are prescribed have been standing on our shelves for in many cases one or two years, as is the case in many of our small pharmacies, under various conditions of climate.

Again, do the physicians know these conditions? I fear not, for I am sure if they did, they would not trust themselves in prescribing these complex mixtures so freely.

Can we wonder that so often the physician does not get the results which he might reasonably expect had such mixture been recently dispensed (by dispensing I mean the several ingredients of which the mixture was composed) mixed when it was prescribed.

At the last meeting of the American Medical Association the house of delegates adopted the following revised principles of medical ethics relating specifically to the practice of pharmacy which reads:

Section 4. By legitimate patronage, physicians should recognize and promote the profession of pharmacy; but any pharmacist unless he be qualified as a physician, who assumes to prescribe for the sick, should be denied such countenance and support.

Moreover, whenever a druggist or pharmacist dispenses deteriorated or adulterated drugs, or substitutes one remedy for another designated in a prescription, he thereby forfeits all claims to the favorable consideration of the public and physicians.

A curious fact which I could not help but notice while looking up some data

as regards these trade-mark compounds was that no reference was made in any of the numerous articles in regards to the possibility of deterioration of these compound mixtures before being prescribed and dispensed.

The only mention I did find was in a pamphlet published by the Council of Pharmacy and Chemistry of the American Medical Association. It is a booklet of about a hundred pages, and is too long to read at this time, but with your permission I want to read a few lines pertaining to our subject.

"The physician is not supposed to be a pharmacist, and if he were, he has neither time nor inclination to examine all the products he is asked to prescribe, or to inquire into the standing of those who exploit them.

"The number has become so great that the attempt to separate the good from the bad is bewildering, and no one individual is courageous enough even to try. The result of it all is that the educated, thinking physician who is honest with himself and with his patient refuses to prescribe any proprietary mixture; he classifies them all as secret nostrums and lets it go at that.

"Ready-made combinations of remedies may be valuable in many cases, *but to say that such combinations of drugs in fixed proportions fit any large share of the cases for which they are specially recommended by their makers is to say that the services of the physician are to a great extent superfluous.*

"*Machine prescribing is quite incompatible with high ethical standards and professional attainment in medicine.*

"Prescribers should know the virtue of each individual drug they use. They cannot attain that knowledge from the effects produced by mixtures.

"Whenever a physician specifies in the prescription a certain make of preparation, he takes upon himself the responsibility for that preparation. Any reputable pharmacist will, of course, dispense precisely what is ordered, but he cannot be held responsible for a product the composition and character of which are not fully known.

"Only the manufacturer knows what materials were used, the proportions employed, and the method of preparation. Manufacturers have their own formulas and processes, which are not known to the dispenser. The date *when the preparation was made and the manner in which it may have been kept since that date can not be known.* The preparations ordered by prescribers to be those made by some specified discoverer or manufacturer are almost all of the class known as proprietary specialties, those for which special superiority is claimed without any tangible evidence in support of that claim. Such preparations are, wholly or partially, secret nostrums subject to no verification or control, and when dispensed, may be right or wrong, old or new.

"*They usually pass through several hands before they reach the dispensing pharmacist who must accept them unless they bear unmistakable external evidence of being in bad order.*

"Pharmacists freely admit that there are many medical products which can be more successfully made in manufacturing laboratories having facilities which the dispensing pharmacist cannot have; but the claims so often put forward by the manufacturers that only a few medicinal preparations can be as well made with the facilities generally found in reputable retail pharmacies is as grossly exaggerated and ridiculous as the claim of the maker of any proprietary preparation that he possesses some valuable secret by which he alone is enabled to produce the remedy in proper condition.

"*Medicines are most reliable when fresh. The most active and important generally deteriorate more rapidly than others.*

"*Any preparation, therefore, that can be made by any competent pharmacist should clearly be made by the dispenser in order that he may be able to dispense a fresh product.*

"*Then only can he with justice be held responsible for it.*

"*Any preparation about which the maker fails to tell the whole truth should not only be suspected; it should never be used.*

"In view of the widespread acclaim with which the movement, generally referred to as the propaganda in favor of U. S. P. and National Formulary preparations, has been received, it is of vital importance that it shall not be misdirected or misunderstood.

"Properly interpreted it means the application of correct ethical principals to the prescribing and dispensing of medicines, and proper and mutual relations between physician and pharmacist.

"So far as it concerns the physician it means that he will permit neither self-interests, nor the love of ease, nor the plausible tongue of the detail man of the manufacturer of medicine to lure him away a hair's breadth from the path of duty to himself, his profession, and his patients.

"To the pharmacist it means that he must do all in his power to render effective service, and respect to the fullest extent the rights of the physician and the sick.

"Will the pharmacist meet these demands upon him in the right spirit? Will he do his

full duty because he sees it to be right, or will he support the reform movement solely in consideration of assurances of an increased prescription business?

"But pharmacists have the right to expect equally honorable treatment from the medical profession. They have the right to expect that physicians shall not deprive the pharmacist of his legitimate and honorable occupation and his means of livelihood.

"Physicians cannot keep such a complete stock of medicine in their office that they do not find it necessary to write occasional prescriptions. Pharmacists who can and do keep a complete supply, who are able to judge of the quality of drugs and medicines, who renew their stock frequently enough to have all remedies fresh and reliable, and who have all the necessary facilities for accurate dispensing, cannot live on the meager profits of such occasional prescription."

From this it is plain that the American Medical Association, through the Council of Pharmacy and Chemistry, realize the possibility of inactive, deteriorated, or stale mixtures being dispensed. It is also plain that the greater majority of the medical profession has not and does not realize this danger, and it is also a fact, I believe, that if they did realize or understand the possibility of getting stale, deteriorated, or less active drugs when prescribing these compounds, these ready-made prescriptions, that they would not so freely prescribe them, at least not without first obtaining some information in regards the age of these particular compounds.

A WORKMAN'S PARADISE.

According to the *Literary Digest*, William D. Hawood pictures the working quarters of the mill hand, after the Industrial Workers of the World shall have gained control of the machinery of government, as follows:

"There will be a wonderful dining-room where you will enjoy the best food that can be purchased; your digestion will be aided by sweet music, which will be wafted to your ears by an unexcelled orchestra. There will be a gymnasium and a great swimming-pool and private bathrooms of marble. One floor of this plant will be devoted to masterpieces of art, and you will have a collection even superior to that displayed in the Metropolitan Museum in New York. A first-class library will occupy another floor.

"The roof will be converted into a garden. There beautiful flowers will fill your eyes and their sweet perfume your nostrils. The workrooms will be superior to any ever conceived. Your work chairs will be morris chairs, so that when you become fatigued you may relax in comfort."

Papers Presented at the Sixty-First Annual Convention

THE MAKING OF TABLETS BY THE RETAIL DRUGGIST.

BERNARD FANTUS, M. D., CHICAGO.

Efficiency, elegance, and economy, I take it, are the three points of view from which any class of pharmaceuticals must be judged in the determination of its value. Efficiency, of course, comes first. No matter how expensive the medication, if it produces the desired result better than anything else, it is the one to be chosen. If, however, we have the choice between an elegant and a disagreeable preparation of equal efficiency, common sense will teach us to select the pleasant one. Economy, though the last and least consideration in medicine, is also a matter of importance; for obviously that form of medicament should be chosen that is most economic, both as to original expense and as to trouble of preparation.

Tablets are a dosage form of recent introduction that competes with older and better established dosage forms, such as powders, pills and capsules. Before anything new can replace the old, it must establish its superiority. What claims for consideration have tablets to present? In judging them from the three aforementioned standpoints, we find that there is no question about their efficiency, if they are accurately prepared, excepting in case of volatile substances, such as phenol or creosote, which, of course, will not remain in the tablet, even if they are put into it in proper amount. Compressed tablets made from insoluble substances can, contrary to the statement contained in text books, be made to disintegrate readily enough, if from 15 to 20 percent. of starch be added to the powder; the starch, on becoming moistened, swelling with great force and causing the tablet to fall to pieces. Indeed, well made tablets disintegrate more readily than do pills or capsules. While ordinary tablets are not more pleasant to take than are pills or capsules, they are probably more convenient for administration than are powders. What has, however, decided the present status of the tablet is the economic question. Though introduced by Dr. Robert M. Fuller of New York before the Academy of Medicine on February 21, 1878, (published in "New Remedies," March, 1878, p. 69), in a paper entitled: "Dose-Dispensing Simplified," the simplification was evidently not such that the retail druggist could notice it; for tablets have not as yet established themselves in general pharmaceutical practice. The preparation of tablets in large quantities, on the other hand, does offer economic advantages over other dosage forms to such a degree that tablets are the favorite solid dosage form with the manufacturer, who finds ready market for them among dispensing doctors. The retail druggist has been opposed to

the prescribing of tablets by doctors, for tablets have been considered not suitable for extemporaneous preparation, as they require drying, whether made by the tablet triturate process, in which the drying must be done after the tablet is finished or they be made by compression, when the powder is granulated by being moistened and must be dried before being suitable for compression. Furthermore tablets require a special apparatus, with which druggists as a rule have thus far not equipped themselves. Hence, should a doctor prescribe tablets, the druggist must buy them ready made, which increases the stock of ready made goods that he is forced to carry. The druggist asks why tablets should be prescribed, when freshly made pills or capsules are just as good, if not better, and economically much more favorable to him.

There are, however, three influences at work destined, I believe, to change the relation of the retail druggist to the tablet, they are: First, the use of a solid fat as cohesive and lubricant; second, candy medication; third, inexpensive tablet machines.

The employment of a solid fat as cohesive and lubricant was suggested by A. Schleimer in "The National Druggist" (Feb., 1909, p. 54), who advocates the use of cacao butter in lieu of granulation of the powder and subsequent drying. This brings tablets into the category of extemporaneous preparations. All that is necessary is to add three percent. of cacao butter to the powder, and it is ready for immediate compression in a tablet machine. Having found that cacao butter is liable to become rancid on keeping of some of the tablets made with it, I experimented to find a substitute devoid of this tendency, and found it in paraffin of low melting point. For tablets that are not to be kept for any length of time, cacao butter is preferable, as it melts readily and is digestible. The amount of paraffin however that enters into the composition of each tablet is so small that, in spite of its indigestibility, it seems to me it could not meet with any but theoretic objection. Either of these materials, in form of fine shavings, is added to the extent of three percent. with just sufficient trituration to distribute fairly well. Excessive trituration lessens the efficiency of the lubricating agent. If the tablet has a tendency to stick to the punches, the material can be worked better, if a little talcum, say three percent. is added to the powder by stirring it in with a spatula rather than by trituration. This process renders tablet making no more difficult or time-consuming than the making of pills or capsules. It is true, that there are a few materials that do not lend themselves well to this simple process. These would have to be worked up according to the old process, which is very briefly but with sufficient detail described in a booklet by Frank Edel on "How to Make Tablets," published by the Spatula Publishing Co., Boston, 1896; or, more elaborately, in Joseph R. Wood's "Tablet Manufacture," (Lippincott & Co., Philadelphia, 1906.) This much may be stated with confidence, that a druggist equipped with an inexpensive tablet machine can deliberately cut out of his stock all tablets, excepting those that are very frequently called for.

"Candy Medication" will, I believe, become, in future, the children's medication of choice. Would it not be delightful to give all or nearly all our medicine to children in the form of sweet tablets, similar e. g. to those of phenolphthalein that are now, under various names, used so extensively. As a result of my studies, I

can assure you that this is entirely possible. By taking advantage of the fact that some medicines are practically tasteless, that many of the isolated active principles of drugs are easily disguised, and that modern synthetic chemistry has enriched our resources by the production of a considerable number of tasteless or almost tasteless and yet active substances, it has been possible for me to show that as many as four or five dozen different drugs can be worked up into perfectly delicious, not merely palatable, sweet tablets. To furnish a basis for further discussion and experimentation, I have published a "Candy Medication Formulary" in the Journal of the National Association of Retail Druggists, May 22 and 29, and June 12 and 19, 1913. Since then, it has been my good fortune to have had my attention directed to John Uri Lloyd's "Alcresta" alkaloids, which enable one to give the bitterest alkaloids, even strychnine, in "candy form." Having discussed the subject of sweet tablets in another paper I will refrain from occupying your time for its consideration here, excepting to point out that sweet tablets meet all three requirements first laid down. They contain an active dose for a child; though, in case of some medicaments, even an adult dose could be administered in this form, if desired. It is, however, for children that this form is most especially needed. Most adults can swallow pills or capsules. These sweet tablets are more elegant than any other class of preparations in the drug store. It is true, it has been questioned, whether powders made with sugar would not be taken by children as readily as these tablets. Anyone, who would take the trouble to try, would soon find out that the tablets are much more readily taken than powders of the same composition. You do not find powdered sugar in the confectioner's shop. The confectioner goes to a good deal of trouble to make the sugar more pleasant by attractive shape, color and flavor, all in order to increase the relish with which the sugar would be taken. There is really less necessity of making sugar more attractive to a healthy youngster than there is of making medicine as attractive as possible for the sick child. Why not cultivate relish in medication? There is no question of its being possible for the retail druggist to prepare them economically. Mr. J. B. Galloway of Chicago, who has filled most of my prescriptions for sweet tablets, did not find it necessary to charge more for them than he would for as many pills or capsules.

Other form of candy medication has been thought of. Sir James Sawyer, for instance, published in "The Lancet" of August 12, 1911, p. 435, a process for the production of what he calls "cremulae," or medicated chocolate creams. They are prepared by evaporating a mixture of sugar and of milk to the consistency of paste, into which various medicaments might be incorporated, and which is then covered with chocolate, as in the popular chocolate drop. I have quite a number of years prior to Sawyer's publication, prepared medicated chocolate creams as well as other forms of medicated candy. I have, however, come to the conclusion that no other form would be quite as practical as the sweet tablet, most especially for extemporaneous preparation by the retail druggist.

As to tablet machines, Whitall Tatum Co's "No. 25" Tablet Machine is, surely, within the reach of any druggist. All the tablets in my experiments were prepared with a machine of this type at the pharmacologic laboratory of the College of Medicine of the University of Illinois. Should a more rapidly working ap-

paratus be desired, the J. F. Stokes Machine Co., of Philadelphia, could supply it, in form of their "Eureka" Tablet Machines at a figure by no means prohibitive.

In conclusion, then, I would point out that it will pay pharmacists to equip themselves with a tablet machine, first of all, to be able to discontinue carrying in stock a large number of miscellaneous tablets, by being forced to order a bottle of 100, whenever a dozen or two of tablets are called for; and secondly in order to be able to prepare sweet tablets, a form of "candy medication" that physicians will readily take up with, as soon as they are acquainted with them, and a reliable source of supply has been secured.

UNIVERSITY OF ILLINOIS, CHICAGO.

PERSONAL LIBERTY IN BERLIN.

Americans who prize their "personal liberty" very highly have been in the habit of ridiculing what seem to them the petty regulations of the police forces of large German cities. The frequency with which the American tourist in Germany sees the sign beginning, "It is forbidden," gives him the notion that his movements are unnecessarily restricted. Surely, at least, such regulations as the following, in force in Berlin, will appear ludicrous to the gangsters of our large cities who may carry guns with immunity and rob at their hearts' content:

"Persons may not walk more than three abreast or stop or congregate for any extended period of time.

"Persons with umbrellas or walking sticks must not carry or swing them in any manner likely to imperil the safety of passers-by.

"No windows or doors of houses, flats, shops or restaurants in which music is being played may be kept open.

"No whistling, singing, shrieking, shouting, or loud talking of any kind likely to endanger the quiet of the streets is to be permitted.

"Teamsters in charge of wagons, teams, or trucks loaded with resounding metal of any kind are forbidden to drive in a manner calculated to cause nerve-shattering noises.

"No paper, remains of fruit, cigars, or cigarettes may be thrown into the streets.

"The dragging of clothes of any kind—women's dresses or anything else capable of producing dust—is prohibited.

"Householders are required in winter to keep the footpaths in front of their premises clear of snow and ice between 7 a. m. and 8 p. m. After 8 p. m., if the sidewalks are slippery, sand or ashes must be sprinkled."—*Daily Newspaper*.

REPORT OF THE HISTORIAN.

CASWELL A. MAYO, NEW YORK.

The most interesting event of the year from an historical point of view has been the formation in Paris of a society devoted to the study of Pharmaceutical history, of which M. Eugene Guitard is the secretary and M. Dorvamt, president. M. Guitard has published a most interesting volume commemorative of the 50th anniversary of the foundation of "L'Union Pharmaceutique," which covers not only the history of that journal, but also covers two centuries of the press in the service of pharmacy. I have pleasure in directing attention to a copy of this volume, which I have received through the courtesy of M. Guitard.

The value of historical study has been recognized for the first time in an international congress by the organization of a section devoted to medical history in the Seventeenth International Congress which has just been held in London. In connection with this congress an exhibit was made by Mr. Henry S. Wellcome of a number of articles connected with the history of medicine, including books, portraits, surgical instruments, etc. This exhibit has been spoken of in terms of the highest praise both in the medical and lay press, and it is intimated that it may eventually form the nucleus of a permanent historical medical museum. Mr. Wellcome has long been a member of the American Pharmaceutical Association and it is not improbable that his interest in the historical aspects of medicine has been stimulated by the work of our own historical section, in which he has always taken an interest.

Another interesting event somewhat nearer home is the recognition of the importance of historical pharmacy by the creation of a Chair of Historical Pharmacy in the School of Pharmacy in the State of New Jersey and the election to the professorship of a former chairman of this section, Otto Raubenheimer.

An interesting and praiseworthy precedent was set at the March meeting of the New York College of Pharmacy, which was devoted to memorial notices of the members of the college who had died during the past year. Complete and sympathetic accounts of the service to pharmacy rendered by the deceased members. These accounts written and read by our honorary president, Thomas F. Main, secretary of the New York College of Pharmacy, were illustrated with lantern slides of portraits of the members. It is with pardonable pride that we point out that these men who had done so much for pharmacy locally were nearly all members of this Association. A copy of the Memorial issue of the Alumni Journal containing these accounts is presented herewith.

Endowments and Scholarships in Pharmacy.—A questionnaire concerning scholarships and endowment in pharmaceutical colleges was sent out by the Historian and the data collected will be deposited with the historical collection for future use. A brief summary being given here.

We learned but of two fellowships, one in the University of Kansas and one in the University of Michigan. Scholarships are maintained in the following schools: University of Kansas, University of Washington and University of California, and in the colleges of Massachusetts, Philadelphia, New York, Brooklyn and Pittsburgh. The Chairman of this section at the request of the Historian, has prepared a history of the funds of the Massachusetts College of Pharmacy, which I shall take the liberty of reading in this connection for the information and inspiration of other institutions.

HISTORY OF THE FUNDS OF THE MASSACHUSETTS COLLEGE OF PHARMACY.

JOHN G. GODDING.

The first Endowment to the Massachusetts College of Pharmacy was for \$2000.00, willed in 1872 by Mr. Charles French, a prominent Apothecary in the North End of Boston, and Vice-President of the Institution from 1839 to 1844. This was used in building the present College structure. In 1896 the College voted to restore this Fund which June 1911 amounted to \$3404.35.

In 1892, Mr. James S. Melvin, another well-known Apothecary, died. He was a Trustee of the M. C. P. for a number of years. He left by will \$1000.00. This has accumulated to \$1455.00.

Miss Mary Jane Aldrich became interested in a clerk in the employ of Mr. S. A. D. Sheppard and a student at the M. C. P., and it is probably through some word or solicitation of Mr. Sheppard's that Miss Aldrich at her death in 1892, willed the College \$7250.00, stipulating that 5 percent of the income should be added each year to the principal. This fund is now \$10,492.80.

Mr. Charles Mead of the type of Messrs. French and Melvin and a former member of the M. C. P. died leaving a will in which the Massachusetts College of Pharmacy was to receive \$2500.00 at the death of the person named in the will, which was in 1896. This now amounts to \$3348.25.

Prof. B. F. Davenport, our first Professor in Analytical Chemistry, donated \$125.00 to be known as Davenport Library Fund, the income to be expended on the Library. This has accumulated to \$365.70. Dr. Davenport attends many of the functions of the College up to the present time.

The funds, each bearing the name of the donor, came in cash and were placed in the hands of three Trustees who had charge of investment and income.

Mr. Warren B. Potter of the firm of Weeks & Potter, well known Wholesale Druggists in former years and a warm friend of Mr. S. A. D. Sheppard, was much interested in the erection of the present College Building and suggested many ways to raise the debt. When he died his entire estate was willed to his wife, Sarah E. Potter, he having expressed his wishes to her as to its disposal.

Mrs. Potter died in 1904. She bequeathed to the Massachusetts College of Pharmacy \$50,000.00 and numbered it among the residuary legatees. The stipulation was that the same should be called "The Warren B. Potter Fund" and that a memorial of this fund in the form of a bronze tablet, suitably inscribed, be fixed in a conspicuous place in the College Building after receiving this bequest. The College placed the bronze tablet designed by Cyrus Dallin in the hall near entrance, at a cost of \$3500.00. The amount received from Mrs. Potter's estate was \$196,699.69, and now amounts to \$203,968.78.

This fund came to the College in railroad bonds, stocks, shares in commercial buildings and industrials. After receiving this fund the College increased the number of Trustees

of Funds to five, one to be elected each year to serve for five years. There was also created a Building and Contingent Fund into which the income from all funds, excepting the one noted, is placed. Up to this time the income from other funds was added to the principal. It also established the rule that all securities purchased or held should be such as are approved by the Savings Bank Commissioner of the Commonwealth of Massachusetts. The Trustees were given time to dispose of such securities as did not meet these requirements which has been done without any loss to the funds. The investments are now principally in railroads, municipal and state bonds and nearly all are registered to the Treasurer of the M. C. P. as to principal.

The total value of funds is \$224,782.88 and the average income is about 4%. The Trustees of the funds meet monthly and have rules for the safe handling of these funds.

The policy of the College is to keep these funds intact, using only the income from the Building and Contingent Fund. From this we cleared the mortgage from our present building (\$30,000.00), erected the Potter Memorial and last June bought land for a new building at a cost of \$40,000.00, paying \$15,000.00 cash.

You inquire what use we propose to make of our income. Besides what has been pointed out we are now intent on paying for the land and have a Building Committee in charge of the plans and requirement of the prospective new building, and a Ways and Means Committee in charge of the raising of funds for the building. These Committees have recently been appointed by President Packard.

With what we can realize from our present property and the hope of receiving assistance from our friends our next aim will be the beginning of a new building.

J. G. GODDING, Treasurer.

PHILADELPHIA COLLEGE OF PHARMACY.

Scholarships.—Twenty-nine scholarships are possible under the awards of the Scholarship Committee. Usually a scholarship is awarded to the student for the three-year course, making seventeen which are awarded each year. They are as follows in the order of their founding:

Peter Williamson Scholarship, 3 lecture tickets.

Robert Bridges Scholarship, 3 lecture tickets.

John M. Maisch Scholarship, 3 lecture tickets.

Thomas H. Powers Scholarship, 3 lecture tickets, 2 laboratory tickets.

*Keasby and Mattison Scholarship, 3 lecture tickets and 2 laboratory tickets.

Edward C. Jones Scholarship, entitles the student to 2 laboratory tickets.

Henry and W. P. Troth Scholarship, 3 lecture tickets and 2 laboratory tickets.

*E. T. Dobbins Scholarship, lecture, laboratory, and recitation tickets.

James T. Shinn Memorial, lecture, laboratory, and recitation tickets.

Class 1884 Memorial, lecture, laboratory, and recitation tickets.

*Thomas S. Wiegand Scholarship, lecture ticket, laboratory and recitation tickets.

The College also allots six scholarships a year to the Philadelphia Board of Education; one to be applied to each of the following schools: Boys' High School, Girls' Normal School, Girls' High School, Northeast Manual Training School, Central Manual Training School, and Southern Manual Training School, making to the Board of Education 18 scholarships in course each year. They must be allotted to graduates of these institutions who have signified over their signature their intention to continue in the practice of pharmacy or its allied branches, and to make it their life work.

The E. T. Dobbins Scholarship is limited to students who are residents of New Jersey.

JOSEPH P. REMINGTON.

It will be observed that the term "scholarship" here is used in its widest sense, including free tuition as a scholarship, though such use of the term is hardly justified from the University School point of view, since in many state universities tuition is free to all residents of the state.

*Awarded after competitive examination.

College Libraries.—In connection with the work of the Historian as a member of the Library Committee of the New York College of Pharmacy, Columbia University, his interest has been aroused in pharmaceutical libraries. He, therefore, sent out in March a questionnaire on pharmaceutical library methods, the answers to which will prove useful to those interested in this particular subject. The answers received from the university schools can hardly be compared with those furnished by independent colleges, for the university school rarely has a separate pharmaceutical library, depending upon the university library. The number of volumes contained in the separate pharmaceutical libraries vary from a few hundred in the younger institutions up to 12,000 in the library of the Philadelphia Library of Pharmacy. This number refers to the bound volumes only, and does not include dissertations and pamphlets.

The New Orleans College of Pharmacy has 300 volumes; the School of Pharmacy of the Medical College of Virginia 500; the California College 971; University of Washington 1000; Iowa University School 1015. The University of Minnesota 1500; University of Pittsburgh 1700; Vanderbilt University 1300; University of Kansas 2837; Illinois 2500; Brooklyn 3500; New York 4500; Massachusetts 7177; Michigan 5500; Philadelphia 12,000. The Pharmaceutical Institute of the University of Berlin has 3300 volumes and 4000 dissertations, showing that our American school libraries as a whole compare fairly well with that of this institute.

The greatest of all pharmaceutical libraries is the wonderful Lloyd Library, which several of us had an opportunity to inspect on our visit to Cincinnati last week. This institution has nearly 39,000 bound volumes and 50,000 pamphlets, housed in two large buildings and maintained at the expense of the founders—Lloyd Brothers. It is difficult to find words in which to adequately express our sense of obligation to Professor Lloyd, our honored ex-president and his brothers for their altruism in founding and maintaining this unique institution.

Greek Letter Fraternities.—A beginning has been made by the Historian of the collation of information regarding the history of the Greek Letter Fraternities in Pharmacy. Letters were sent to all the colleges of pharmacy in the United States for information on this topic, which was followed up by individual correspondence with members of the several organizations. The data collected will be deposited in the archives of the association. The Phi Delta Chi fraternity will always have a special interest for the American Pharmaceutical Association, because of the fact that it was founded by our honored and beloved ex-president, Albert B. Prescott, of the University of Michigan. Chapters of this Order have been established in sixteen different colleges and universities and it issues an interesting quarterly, *The Communicator*, from Boston.

The Kappa Psi fraternity has 31 chapters and is in a most flourishing condition, maintaining a very creditable organ—"The Mask" which is published quarterly at Menasha, Wis.

One of the younger frats is the Tau Epsilon, founded about four years ago at the New York College of Pharmacy by J. M. Breitenbach, Phar. D. Full data regarding these various fraternities are deposited with the historical collection.

The Historian also begs leave to acknowledge receipt of a number of photographs of groups of members of the various Pharmaceutical organizations, a

list of which appear below. These will be placed in the archives of the association.

Particular thanks are due to Hugo Kantrowitz of New York, for an interesting album of snapshots of pharmacists, taken by him. This album is shown and will be observed with interest by all of those who have attended recent meetings of the association, as it includes a number of excellent pictures of the Boston and the Denver meetings.

PHOTOGRAPHS ON FILE FOR HISTORICAL SECTION.

21. Prof. Dr. A. Bernthsen, Gr. Bad. Hofrat, Direktor Bad. Anilin und Soda Fabrik, Mannheim.
22. Prof. W. H. Perkin, Manchester, England, and Dr. Carl Duisberg, Director of the Farbenfabriken of Elberfeld, taken at the Eighth International Congress of Applied Chemistry.
23. Group: Dr. Carl Duisberg, Dr. John H. Findley, President College of the City of New York, and Herman A. Metz.
24. Group of American Chemists: Dr. Charles Baskerville, Professor of Chemistry, College of the City of New York; Dr. S. A. Tucker, Professor Electro Chemistry, Columbia University; Dr. A. S. Cushman, Director Carnegie Institute for Research; Dr. E. Coggeshall, Chemical Engineer.
25. President Nichols and Sir William Ramsay on Steamer Excursion, September 7.
26. President Nichols Enjoying a Cigar on Steamer Excursion, September 7, 1912.
27. U. S. Government Chemists: Dr. W. D. Bigelow, Chief, Food Division, Bureau of Chemistry; A. Seidell, Public Health and Marine Hospital Service; E. W. Boughton, Assistant, Bureau of Chemistry; F. C. Cook, Assistant, Bureau of Chemistry.

CENTENARY OF MEN FAMOUS IN PHARMACY.

OTTO RAUBENHEIMER, PH. G., BROOKLYN, N. Y.

In compliance with the promise in my address as chairman of the Section on Historical Pharmacy, at the Denver meeting, I herewith present short biographical sketches of men born in 1813, men who were pharmacists or chemists or botanists, men who have greatly helped in the evolution of pharmacy and men to whom pharmacists should forever be thankful.

The celebrated pathologist, Rokitsansky, once said, "An dem Lichte der Alten

sollte die Jugend ihre Fackeln entzünden," which freely translated means, "Let the young light their torches on the fire of their forefathers." Let the deeds of the men before us serve as an example and let us try to follow in their footsteps! Let these short biographies prove instructive as well as edifying, to the profession and to the public!

The compilation of these biographies has been made from the following works:

Gallerie, by B. Reber.

Geschichte der Pharmazie, by Hermann Schelenz.

A History of Chemistry, by Von Meyer—McGowan.

and last, but not least, from the Proceedings of the A. Ph. A.

In spite of the so-called "unlucky 13," the year 1813 was productive more than usual of men who have become prominent in pharmacy, chemistry and medicine.

WILLIAM B. CHAPMAN.

(1813-1874)

He was born at Pennypack Hall, near Philadelphia, June 5, 1813. Graduated from the Philadelphia College of Pharmacy 1834 and moved to Cincinnati in 1835, where he conducted a very successful retail pharmacy. In the spring of 1839 he obtained the degree of M. D. from the Ohio Medical College. He joined the A. Ph. A. in 1851 and was elected President at the Cincinnati meeting in 1854. During the war he was appointed surgeon of the United States army, being stationed at Camp Dennison. In 1872 he was elected professor of pharmacy in the Cincinnati College of Pharmacy and was also appointed a member of the pharmaceutical board of examiners. At the time of his death, October 10, 1874, he was the oldest pharmacist in Cincinnati and held a high rank in the profession.

JOHANN RUDOLF WILD.

(1813-1868)

He was born on January 10, 1813, and served as apprentice in his father's pharmacy, the "Sonnenapotheke," in Kassel. Later he finished his pharmaceutical education under the celebrated pharmacist W. W. F. Wackenroder, in Jena. In 1849 he succeeded his father in the pharmacy at Kassel. He was the author of the following works:

"Relation of Magic to Alchemy, Astrology, etc. Kassel 1841."

"Description, Preparation, and Testing of Medicaments, Kassel 1842."

Wild was a member of the Revision Committee of the Pharmacopoeia of Hanover in 1861.

FRIEDRICH SCHÖDLER.

(1813-1884)

Originally a pharmacist, he took the degree of Doctor of Philosophy and devoted himself to chemistry. At Tübingen in 1839, he translated into German, the master-work in pharmacy of its time, namely, "Traite de Pharmacie," by E. Soubeiran, the celebrated chief pharmacist of the hospitals in Paris. This book was published by C. F. Winter in Heidelberg, 1839, and became one of the best known pharmaceutical works in Germany. Schödlér also obtained great popularity through the publication of his "Book of Nature." He became director of the Realschule in Mainz.

CARL FRIEDRICH RAMMELSBURG.

(1813-1899)

Was born in Berlin in 1813 and studied pharmacy in the "Rote Apotheke" and passed his state examination in 1834. Thereafter he studied chemistry under the celebrated Mitscherlich and Rose. In 1840 he established the Private Chemical Laboratory, and in 1851 became assistant professor at the Technical College, and in 1874 director of the second chemical laboratory at the university. In 1891 he retired and died December 29, 1899. His researches greatly enriched inorganic and especially mineralogical chemistry. Rammelsberg helped very much in the development of quantitative analysis. He determined the atomic weight of molybdenum, prepared phospho-molybdic acid and ammonium phospho-molybdate. During his time the rich deposit of potash salts was discovered in 1860 at Stassfurt. Rammelsberg called attention to the high percentage of potash which was left in the waste products, the so-called Abraumsalze, which were then thoughtlessly thrown away. By the evaporation and crystallization of Solution of Potassium Bicarbonate, he obtained colorless permanent monoclinic crystals of Potassium-sesqui-carbonate.

He also determined the chemical composition of Kaolin, as

He performed great service by the publication of a number of text books, as for instance:

"Handbuch der Mineralchemie."

"Krystallographisch-physikalische Chemie."

"Grundriss der Anorganischen Chemie."

"Grundriss der Chemie."

which books will remain the everlasting monuments of Rammelsberg, the former apothecary.

JEAN SERVAIS STAS.

(1813-1891)

Was born at Louvain, France, and as early as 1835 without having access to a properly equipped laboratory, made a thorough chemical investigation of phloridzin, which helped to his securing a place in the laboratory of the celebrated Dumas at Paris. This first research of Stas even attracted the attention of Berzelius. Dumas and Stas worked together upon the action of alkalies on alcohols, ethers and esters of the fatty series. Together they began a thorough determination of the atomic weight of carbon, a research which formed the starting point of the chemical work, with which the name of Stas is so intimately associated, and which extended over thirty years, from 1840-1870.

In 1840 he was appointed professor of chemistry at the Ecole Royale Militaire in Brussels, a position which he held for many years, until a throat affection compelled him to resign. In connection with a murder case arising in 1850, Stas originated a method for the detection of individual alkaloids. His method was modified by the pharmacist Friederich Julius Otto (1809-1870) and is still known and used today as the Stas-Otto method. In 1880 Stas furthermore determined the spectra of the alkaline earths. The long and arduous researches

of Stas brought out quite a number of important facts and in consequence took their proper places in the history of chemistry.

LUDWIG ANDREAS BUCHNER.

(1813—?)

He was born July 23, 1813 in Munich where his father, Dr. Johann Andreas Buchner held the position as chief apothecary of the charitable hospitals. He studied pharmacy in der "Mohrenapotheke" at Nuremberg. In 1834 he went to Paris, attended the lectures of Gay-Lussac and Chevreu and became assistant to the celebrated chemist Bussy. He returned to Munich where he received the degree of Doctor of Philosophy in 1839, and Doctor of Medicine in 1842. He then commenced his academic career and in 1852 became professor of pharmacy at the University of Munich.

Buchner was a very productive author. He published twenty-five volumes of the *Repertorium für Pharmazie* and his celebrated *Commentar zur Pharmacopoea Germanica*, together with the supplement. He was very active as a member of the Committee of Revision of the Bavarian Pharmacopoeia and in 1871 became a member of the Revision Committee of the new German Pharmacopoeia.

G. ADOLPHE CHATIN.

(1813—?)

He was born on November 30, 1813, at Tullins, France. In 1814 he became Doctor of Natural Science and pharmacist of the first class, and in 1844 Doctor of Medicine. In 1842 he became connected with the *École supérieure de Pharmacie* in Paris and served as its director for thirteen years from 1873 to 1886. He is the author of a number of works among which was "*Anatomie Comparée des Vegetaux*" which is one of the best known. His numerous works were published in *Comptes rendus de Academie des Sciences*, in *Bulletin de la Societe botanique de France*, and in *Journal de Pharmacie et de Chimie*.

DR. JOHAN ELIZA DE VRIJ.

(1813-1898)

One of the most famous men, whose cradle stood in an apothecary shop in Holland, was Johan Eliza de Vrij. He was born on January 31, 1813, at Rotterdam and was apprenticed in his father's apothecary shop and continued the pharmacy after his father's sudden death on December 10, 1831. He studied chemistry, pharmacy and botany under the celebrated Dutch chemist Georg Johannes Mulder. As early as 1831, he translated the master work of chemistry of its time, namely the book of Heinrich Rose into the Dutch language. Through this translation and his other chemical work, he became thoroughly acquainted with the most noted pharmacists, chemists and botanists of his time, including such man as Gustav Magnus, Jons Jacob Berzelius, Johann Bartholmee Trommersdorff, Lorenz Geiger, Rudolf Brandes, Joseph Pelletier, Jean Bienaimé Caventou, Justus Karl Hasskarl, L. Nees von Esenbeck and Justus von Liebig and others.

In 1838, he graduated from the University at Leyden with the degree of *Magister Matheseos et Doctor Philosophiæ Naturalis*, and then became in 1841 successor to his former teacher Mulder at the University of Rotterdam. In 1850

he sold his pharmacy and devoted himself to an Academic career. His achievements are so numerous that it is impossible to go into details. However, it may be stated that he reached conclusions which served for the foundation of our present knowledge of bacteriology. He experimented with nitro-glycerin, red phosphorus, the assays of opium, of cinchona, and of cherry laurel water, different tests for strychnine, etc., etc.

The Dutch Government was very fortunate in increasing their cinchona plantations in Java, under the direction of the German botanist, Franz Wilhelm Junghuhn (1812-1864.) In 1857 de Vrij was sent by the government to Pahua, Dutch India as a governmental chemist. It was here that de Vrij made his many examinations of the different species of cinchona and obtained worldwide reputation as a chinologist. In 1865 he returned to Holland and conducted a private laboratory for the assay of cinchona bark. On account of his work on cinchona, Queen Victoria on July 14, 1880, bestowed upon de Vrij the "Order of the Indian Government," on account of which the title, "Companion of the Indian Empire" which is abbreviated as C. I. E. is added to his name. On June 6, 1882, de Vrij celebrated the 50th anniversary of his State Board examination.

De Vrij used his vacation time in travel, and became acquainted with other prominent men, and the following quotation from the "Chemist and Druggist" of October 15, 1881 may be of interest.

"Properly there is no foreign chemist with whose personal appearance pharmacists are more familiar than with that of Dr. de Vrij of The Hague. He has been called 'The Flying Dutchman' on account of his frequent visits to our shores. Cosmopolitan in his friendship and in his speech, he is to be met with whenever a congress or a scientific gathering forms a reasonable excuse for travel."

Johan Eliza de Vrij's name was frequently mutilated and mispronounced as "Wrii" and for this reason he was in the habit of signing himself "Vry" when corresponding with foreigners.

JOHN KING, M. D.

(1813-1893)

Dr. de Vrij was born on the last day of January. Dr. John King on the first day and both of these men have made the year of their birth famous, in pharmacy and medicine.

On New Year's morning, 1813, just as an American Man-of-War came into the harbor of New York towing a British prize, John King opened his eyes upon a world he was destined to adorn. The biography of Dr. John King has been so well written by Dr. Harvey Wickes Felter in Bulletin No. 19, Pharmacy, Series No. 5 of the Lloyd library that it would be wasteful to enter the subject very deeply. Suffice is to say that Dr. John King became famous as a physician, chemist, teacher, humanitarian, author and scientist. In 1835 he became the discoverer of podophyllin or resin of podophyllum, the first Eclectic resinoid. Full particulars regarding this discovery are given in the Bulletin above mentioned. As an author, John King's name will live forever in pharmacy in the "American Dispensatory." After eighty well-spent years, he died June 19, 1893 at North Bend, Ohio.

Contributed and Selected

THE RELATIONS OF THE PROPRIETOR TO THE RETAIL DRUG-GIST AND PRICE MAINTENANCE.*

F. K. FERNALD, ELKHART, IND.

I would like to say at the beginning of this report that the views of your chairman may be somewhat influenced by his personal position in regard to some important details which later will be quite thoroughly discussed.

Our relations with the retail trade appear on the surface and from the personal standpoint to be cordial and satisfactory, and the volume of business is on the whole fairly maintained.

To those in closer touch with the retail dealer, and therefore better acquainted with his personal views and his organized efforts to make such views effective, there is, I think, easily recognizable a serious movement, not perhaps intentionally so, but nevertheless antagonistic to the interests of proprietary manufacturers.

This movement has no reference, as a rule, to the merits or demerits of the articles themselves, but has had its origin in the rather complicated conditions arising from (1) a compulsory change in the working methods of the organized trade, (2) from the extremely unsatisfactory price schedules in the large cities and the localities immediately surrounding them, and (3) to an uneasy feeling among the ultraethical members of the trade caused by the vicious attacks upon proprietaries generally made during the last five or six years by individuals who have been either misled by their prejudices and associations or who have had some commercially selfish end in view.

You will remember that the slogan of the N. A. R. D. at its organization was and is now "Live and let alive," and a very good slogan it is.

Following the decision of the Federal Court at Indianapolis, commonly known in the trade as the "Indianapolis Decree," much of the militant spirit which previously characterized the efforts of the organization for better prices disappeared of necessity, and was replaced by a much more chastened feeling, and followed by efforts to maintain the prestige and influence of the association along other lines. The immediate result was the propaganda movement, far heralded at the start, but apparently in the net result somewhat disappointing.

*Abstracted from the "Report of the Committee on Relations with the Retail Drug Trade," presented at the last annual meeting of the Proprietary Association of America. The paper is reprinted as a contribution to the subjects of price maintenance on proprietary medicines and the cooperative manufacturing and buying movement. The report is not only well written and readable, but presents a fair-minded statement of the retailer's reasons for being dissatisfied with his present profits on proprietary goods, and shows that the proprietors are awakening to the necessity of cooperating with him in devising or finding an effective legal method for giving the relief asked for.

While this movement may not have measured up to the fond anticipations of its friends, it yet had a temporary tendency to bring the druggist and physician closer together, a result which could hardly be an advantage to the manufacturing proprietor. In this movement the idea was to induce the physician to use in his practice the pharmaceuticals made by the druggist instead of those made by the well-known manufacturers of pharmaceutical specialties. A certain amount of detail work was done among physicians, many "get together" meetings were held, and the doctor was urged to use the home products of the druggists. The arguments presented doubtless had a considerable effect, but I can easily imagine that some of them fell on unsympathetic ears and that propositions on the quid pro quo order might have been made, which if accepted by the druggist must have bound him to look with less favor on the sale of advertised proprietaries.

Following also the "Indianapolis decree," the cut-rate situation in many localities grew steadily worse, not that prices were cut nearer to cost, but that more cutters and cut-rate cities developed, and the chain store idea came more and more to the front.

As a corollary to the chain store in private hands various enterprises, large and small, of a co-operative nature, with druggists as stockholders, were organized and most of them appear to have met a fair measure of success.

Chief among the chain store enterprises are the Riker corporation, the Owl Drug Company and the United Drug Company, the latter sharing profits with retail druggists who are its stockholders.

The Riker concern, known as the Riker-Hegeman Corporation in New York and New Jersey, has also located in Philadelphia and Washington, D. C., besides acquiring stores in Schenectady and Rochester, N. Y., while as the Riker-Jaynes Company it is firmly seated in Boston and most of the other cities of Massachusetts, Rhode Island and Connecticut, and is about to begin operations in Portland, Me., with prospects of farther extensions in the States of the Middle West. The Owl Drug Company covers the Pacific coast states.

The United Drug Company is now operating a number of stores in the New England cities and in Buffalo, N. Y., and is marketing the "Rexall" line throughout the country with the assistance of those dealers who are among its stockholders.

The Owl Drug Company has long been the dominant concern in California, Washington and Oregon and has been a persistent price cutter, thoroughly demoralizing the trade in localities in which it operates.

The United Drug Stores of Baltimore is also a newcomer in the field.

It would seem that the Riker stores of New England were able alone to sufficiently demoralize the trade, but in the cities where United Stores are also located and in which the competition on advertised proprietaries is something frightful, the lot of the average druggist, ground as he is between the upper and nether millstone, must be very unhappy.

One of the most deplorable features of the situation is that the conditions described are unlikely to be long confined to present areas.

The smaller co-operative ventures of dealers in the various cities, the "buying clubs" and many small jobbing houses owned by the retail dealers which are

thorns in the flesh of the regular wholesale druggists, add their complications to the general situation, not only for the jobber, but for the manufacturer.

These co-operative ventures at first originated in localities (usually large cities) in which the retailer, unable to protect himself adequately against the ruinous prices made by the professional cut-rate dealers—that is, being unable to control his own selling price—looked with much favor upon plans which gave promise of a saving at the buying end.

This movement, however, has grown in some instances to larger proportions, and has been handled in a manner to excite the envy of promoters who have long traveled the path of high finance in other lines.

It has also involved the manufacture and sale of many articles of a proprietary nature, often on a small scale, but sometimes on a large one, and as to which every individual sale over a retail counter has been based on a demand created by your advertising and in each such instance your legitimate business and profit have been diverted to other channels.

The conditions outlined above have been of gradual growth, and for that reason their influence has not been readily noted, but taken as a whole it would seem that they must work to our disadvantage, not only in the movement of our products through the hands of retail distributors, but also in a divergency of interest, which is sometimes manifested in a lukewarm support in matters which are important to us, or by a seeming disregard of our welfare in matters which seem important to them.

The conditions to which I have called your attention are in my judgment very important to every proprietor, and are due primarily to the inability of the retail druggists to obtain the fair profit on advertised proprietaries which we say he should have and to which he is certainly entitled.

It is true that with the ultra-ethical portion of the trade arguments unfriendly to proprietary interests would have had their influence regardless of price conditions, and articles marketed on fake lines or palpably sold for improper purposes would have been the subjects of discrimination by the self-respecting druggist doing his plain duty to the public, but it is a commercial axiom that the interest of a merchant cannot easily be diverted from a legitimate and reputable article whose sale shows a reasonable profit. However, when that profit disappears why should he be interested? Why is not a certain antagonism perfectly natural and why is the idea of substitution not the inevitable result?

I do not undertake to fix the blame for this trade difficulty, but the fact remains that it is a glaring absurdity to expect a retail merchant—and the druggist is a retail merchant to the extent of half his business or more—to continue to sell articles of any nature on which he makes but an inadequate profit or none at all.

Don't blame the druggist generally for this condition. He is in business to make a living, and as he cannot do so by selling your article without a profit he will sell something in its place whenever possible upon which his profit is adequate. And remember, too, that it is the business of the various syndicates, co-operative concerns, and the older manufacturers of non-secret goods to furnish the trade the proper articles with which to effect the substitution. Re-

member, too, that these concerns flourish in proportion to the spread of professional price cutting, and that the loss in your business is measured by their success. Bear in mind, also, that the habit of substitution is not natural but acquired.

It does not matter where the blame lies. It does not matter that the trouble originates in the ranks of the retail trade. The important thing is to find a means of cutting out the professional price cutter. The retailer says that the manufacturer should do it, but he does not point out the way. The manufacturer perhaps has a right to say that he is not responsible, but that attitude cannot rehabilitate his business, nor assist his retail distributor, and is probably tempered by the theory that he gets his price and his profit, no matter what happens to the goods after they leave his hands, which theory is, in my judgment, very short sighted.

The obvious method of accomplishing this result is unfortunately closed by the various anti-trust laws of the states and nation, and we have this very peculiar situation—that a small retail merchant cannot protect himself against piratical price cutting on articles which comprise in volume about one-half of his business, though the laws were designed to prevent monopolies and discourage unfair competition, and the decent manufacturer takes his business life in his hands and jeopardizes his personal liberty if he tries to assist him.

I am not attempting to point out the solution of the problem, but believe that the anti-trust laws should be so amended as to protect the average merchant against the unfair encroachment of his large and purse-proud competitor. The small merchant has certainly some rights which even the legislators and the public should respect.

Articles in a recent number of Everybody's Magazine on the "High Cost of Price Cutting," by Prof. Galloway, of New York University, and by Henry B. Joy, of the Packard Motor Car Co., show that similar troubles afflict other lines. The Ingersol Watch Company, among others, is also having trouble to maintain the price on its dollar watches.

Some legislator in New Jersey has evidently seen light on this subject, for after the passage in the Legislature of that State of a number of very stringent anti-trust bills, he introduced a bill which is now a law forbidding the stealing of the trade-marks, good will, etc., of another, in which good will the advertised retail price is included and compelling the observance of that price if notice of a fixed selling price accompanied the package. If this law can be sustained in the courts it will do much for the merchants of New Jersey.

My observation is that our relations with our ultimate distributors are from a personal standpoint satisfactory, and on the commercial side only fair, with a tendency to grow worse. If we all made it a point to keep in close touch with the retailer, co-operating wherever possible with his legitimate efforts to better his condition, if we attended his trade association meetings, if we took pains to consult with him individually and collectively as to matters of mutual interest, we should be better able to share his viewpoint and better able to help him and ourselves when emergencies arise.

I cannot believe that any argument along this line is necessary, as the advantages from a close association with our distributors is so self-evident. Nor do I

think I should take the time to go into this phase of the subject in detail. Gentlemen of your business experience are well able to devise means for accomplishing the desired result without elementary instructions. You have all taken post-graduate courses. My aim is to bring to your attention the vital necessity of close and pleasant relations with those who hand our goods over the counter to the public for whose business we advertise, and to insure so far as is possible that this transaction is accompanied by a standard and adequate profit.

I want to urge upon you as strongly as possible the great importance of making a personal and business friend of the retail druggist. Go to him with legitimate preparations advertised on clean lines, convince him that you have his interest in mind as well as your own, and your enemies will find it difficult to induce him to join in unfair attacks on your business.

BUYING CHEMICALS FROM PEDDLERS.

OTTO RAUBENHEIMER, PH. G., BROOKLYN, N. Y.

The writer well remembers that some years ago, when refined deodorized wood alcohol was first placed on the market under a fanciful name, silver tongued salesmen were trying to convince the pharmacists throughout the country that this product was non-poisonous, and was in every way equivalent to grain or ethyl alcohol, and could be used in its place. As the result of this, many druggists throughout the United States were induced to use this product on account of its cheapness, and as a consequence some druggists had to pay fines, or even go to jail.

Practically the same conditions have existed, and do still exist ever since the new chemicals, the so-called coal tar derivatives, have been introduced into the United States. The large chemical industries especially those of Germany, have spent thousands, nay millions of dollars to perfect and to introduce these products, and for that reason, are charging a fair, and in some cases, a somewhat fancy price for these new chemicals. The processes of manufacture are patented, and the names of the chemicals are trade-marked. This serves as a protection for the manufacturer. The little republic of Switzerland has a patent law, which refuses protection to chemicals and chemical processes, and the result is that most of these chemicals are duplicated or imitated in that country, and are distributed from there. The United States in particular seems to be one of the large outlets for these products. Sometime ago, the writer read the following letter from a firm in Philadelphia:

"Kindly note that we have reduced prices on Givaudan's chemicals. Perhaps, at times, you have calls from druggists who want chemicals at ruinous low prices, regardless of whether the goods are A1 or not. If so, we have some of Siegfried's chemicals on hand, which we will sell below cost. You, of course, buy these at your own risk. Any reasonable offer will not be refused if you can use same."

Just think of such a condition in medicine, intended for the cure and relief of the sick! These imitation goods are distributed by peddlers, who deliver their

fraudulent wares to druggists from hand satchels. These peddlers are irresponsible men, who very frequently make only one visit, who have no address, who leave no bills, and who cannot be held, nor can they be caught. These peddlers are in the same class as "gunmen," many of them being ex-convicts, who would resort to any means in order to obtain money. These peddlers are also the distributors of obscene rubber goods and instruments, the sale of which is forbidden by law. They also supply cocaine and morphine to habitues, and even to school children. These peddlers buy and sell stolen goods and act as fences.

It is a large, a very large traffic that these illegitimate chemicals constitute. They are bought and sold without any guarantee whatsoever. The average druggists buy these chemicals at a slightly lower cost than the genuine articles. They dispense them, and thereby violate the patent as well as the trade mark rights of the manufacturer. That the manufacturer has such a right has been demonstrated on numerous occasions, when druggists have been caught substituting these chemicals in place of the genuine ones, and thereby have had a great deal of legal annoyance, and even have had to pay fines or were sentenced to jail.

But the druggists are not the only guilty parties, as the peddler furthermore is in the habit of supplying the dispensing physician with these articles. The dispensing physician has no means of convincing himself of the chemical identity of these products, much less than the druggist, and thereby runs a greater risk as to the health and welfare of his patients. All he knows is that the goods bear a certain label; that the goods are cheap, and this is the sole reason that prompts him to buy them.

The infringers sell these imitations under their chemicals names, and the peddler claims that they are identical with the patented and trade-marked product, but frequently, almost invariably, these chemicals are grossly adulterated. Aristol has been adulterated with brick dust, Protargol substitutes contained only 3 to 4 percent of silver, instead of 8.3 percent, and were strongly alkaline; Salicylic acid has been sold as Aspirin, and a mixture of magnesium and sodium sulphates as Pyramidon. Adulteration has even gone so far as to imitate the labels of the genuine product, so as to require an expert to tell the difference in the outside appearance between the imitation and the genuine. It is also well known that chemicals supplied by the irresponsible peddler, are generally short weight. It has been repeatedly shown that tablets which are sold by peddlers are fraudulent. Aspirin and Veronal tablets said to contain five grains, have been found to consist entirely of inert matter. A large quantity of tablets are sold by peddlers which are made from adulterated chemicals, and it is predicted that some time or other, there will be a large exposé, which will be a serious blow to pharmacy and medicine.

It has even come to my knowledge that vials, bearing imitation labels of Salvarsan, instead of containing this wonderful remedy were filled with oxide of iron to give it the characteristic color of the genuine article, and this fraud was not discovered until the peddler selling this counterfeit article had left town to continue his criminal activities in another community.

The dangerous practice indulged in by so many druggists, as well as dispensing physicians all over the United States, of purchasing supplies from peddlers,

is one of the most serious menaces to the health and life of every community. How dangerous this practice is has been well demonstrated in a recent case, when a substitute for a chemical which was intended as an eye lotion resulted in the loss of the patient's eye, and in the recovery of heavy damages from the substituting druggist.

Just now I received a circular from A. C. Smith, Windsor, Ontario, Canada, one of the veteran dealers in this class of goods which circular in fact prompted me to write this article. I would ask you to read carefully the following sentence taken from it:

"You are taking an awful chance by buying elsewhere; it is a crime to buy rank imitations and short weight tablets peddled by every Tom, Dick and Harry, whose sole desire is to get all the profit possible irrespective of quality. You owe it to yourself and customers to buy these chemicals only from a reliable source. I positively cannot recommend anyone to you. I am retiring from business with a clean slate—honorably. No man will ever find me ungrateful or dishonorable."

Could there be better proof than these statements, made by a man who knows the truth of the nefarious dealings of these peddlers? How humiliating for us druggists that we must allow ourselves to be advised by that man not to take any chances in buying goods from his competitors!

Retail druggists as well as physicians should take pride in their honorable calling, and in their profession, and should not buy their supplies from irresponsible parties. This, in my opinion, is the curse of the retail trade of today, and the sooner this will be abolished, the better it will be for professional pharmacy.

We pride ourselves on our high state of civilization, but I doubt whether conditions in this particular are anywhere as bad as in the United States; not in the darkest part of Mexico would it be possible for peddlers to sell medicines and no druggist could be found who would stoop as low as to buy supplies from notorious criminals.

It has been rumored that Mayor-elect Mitchell will appoint Dr. H. W. Wiley, Commissioner of Health of the City of New York. Let us hope that this will be done and that Dr. Wiley will begin his activities by putting an end to these criminal practices in New York City which would have a beneficial effect all over the United States.

A STUDY OF SPIRIT OF CAMPHOR TO SHOW THE EFFECT OF ADDED WATER.

J. W. MARDEN AND VANNA ELLIOTT.

The camphor in spirit of camphor can readily be determined either by titration or, if the camphor be from the same source, by means of the polariscope, but the percentage of alcohol cannot be determined by the ordinary distillation method because of the volatility of the camphor. Upon the information that certain druggists were adding water to their spirit of camphor in order to save alcohol, a study was made with the aim of devising a method for the determina-

tion of the percentage of alcohol used in making the preparation and, since the polariscope method for the determination of camphor can be used in this laboratory, a study was also made of the effect of dilution of the alcoholic solutions of camphor on their polarimetric readings.

The method devised for the determination of the alcohol was similar to that suggested by Marden¹ for the determination of alcohol in tinctures of iodine. Known weights of pure camphor, conforming to U. S. P. requirements, were dissolved in ninety-five percent alcohol and the change in weight of a given volume of the mixture was determined per gram of camphor. For this work a weight pipette² was used which held 4.6990 grams of water at 20° C. It was found that one gram of camphor dissolved in 100 cc. changed the weight of this volume of liquid .00340 grains. The use of this factor is best shown by an example:

Grams of camphor per 100 cc. = 10.00
 Wt. (of pipette full) of the liquid.....=4.0420
 .00340 multiplied by 10.00.....= .0340
 Corrected weight = 4.0080
 $\frac{4.0080}{4.6990} = 0.8529 = \text{Sp. Gr. of Alcohol} = 83.98 \text{ per cent.}$
 83.81 percent alcohol was used in making this preparation.

The following table shows some of the results obtained in this way and calculated as above.

TABLE I.

Gms. Camphor per 100 cc.	Wt. of Spirit	% Alc. used in preparation	% Alc. by calculation	Difference
2.00	3.8072	97.05	96.85	— .20
4.00	3.8140	97.05	96.85	— .20
4.00	4.0180	84.34	84.24	— .10
5.00	4.1562	73.54	73.61	+ .07
6.00	4.2602	64.97	64.93	— .04
6.00	3.8310	97.05	96.34	— .71
7.00	4.2204	68.36	68.68	+ .32
8.00	4.1235	77.36	76.96	— .40
9.00	4.1312	76.20	76.72	+ .52
10.00	4.0420	83.81	83.98	+ .17
12.00	3.9700	89.41	89.36	— .05

It is to be seen readily from this table that the percentage of alcohol can be determined by this method with a very fair degree of accuracy. It must be admitted that this factor gives somewhat better results with the lower percentages of alcohol and lower concentrations of camphor. It is, however, only in a spirit that is low in camphor that dilution with water is to be expected. Under good conditions the above method should give within 0.5 percent of the true percentage of alcohol used in making the preparation.

It was found that polarimetric readings of solutions of a given number of grams of camphor dissolved in 95 percent alcohol were not the same as when the same weights of camphor were dissolved in more dilute alcohol. Solutions of varying strengths of both camphor and alcohol were therefore polarized and

¹This Journal, November, 1913.

²Mulliken, Identification of Pure Organic Compounds. Vol. I, page 229.

the results compared with those obtained with 95 percent alcohol. The following table shows these differences.

TABLE II.

No.	Gms. Cam. found with 95% Alc.	Gms. Cam. in Dil. Alc.		Dif. in Gms. of Cam.	Gms. Cam. low % of Alc.
		% Alc.	Gms. Cam.		
1	4.00	84.34	3.40	.60	.035
2	5.00	73.54	4.66	.34	.016
3	6.00	64.97	4.95	1.06	.035
4	7.00	68.36	6.30	.70	.026
5	8.00	76.96	7.50	.50	.028
6	9.00	76.20	8.40	.60	.032
7	10.00	83.81	9.40	.60	.054
8	12.00	89.42	11.80	.20	.036

Average, .035

The last column represents the value given in column (5) divided by the number of units of percentage that the alcohol given in column (3) is below 95 percent. Although these polarizations were done with a polariscope which does not allow great accuracy, yet it is apparent that there is a very nearly constant decrease of the grams of camphor per 100 cc. found by this method with the decrease in the percentage of alcohol. This decrease in grams of camphor is fairly large and the average value of column (6), .035, equals the number of grams low which spirit of camphor read in the polariscope for each unit percent that the alcohol used in its preparation is below 95 percent. In the case of No. 3, only 4.95 grams were observed. Since the difference of one gram of camphor would change the percentage of alcohol by calculation but a few tenths of a percent, the grams of camphor found by the polariscope could be corrected by multiplying the difference between 9 percent and the percent of alcohol found by .035 and adding this value to the grams of camphor already found by means of the polariscope. For example, a sample was found to contain 4.95 grams of camphor and that 65 percent alcohol was used in its preparation.

$$95 - 65 = 30, \text{ and } 30 \times .035 = 1.05,$$

$1.05 + 4.95 = 6.00$ grams. The sample contained 6.00 grams of camphor per 100 cc. (No. 3, Table II).

Another method was devised to serve as a check upon the specific gravity method for the determination of added water. It was found that 10 cc. of the spirit of camphor of a definite concentration always took the same volume of water to produce a permanent precipitate and that spirit that contained added water took correspondingly less water to produce a permanent precipitation. The following table (a) gives the cc. of water necessary to give a permanent precipitate in 95 percent alcohol and table (b) the volumes of water necessary to cause a permanent precipitate in more dilute alcoholic solutions.

TABLE III.

(a)			(b)			
Gms. Cam. per 100 cc.	Cc. of Spirit.	Cc. H ₂ O	Gms. Cam. per 100 cc.	Cc. of Spirit.	% Alc.	Cc. H ₂ O.
4.00	10.0	17.0	4.00	10.0	84	12.4
6.00	10.0	13.5	6.00	10.0	65	3.6
8.00	10.0	11.3	8.00	10.0	77	5.8
10.00	10.0	9.5	10.00	10.0	84	6.3
12.00	10.0	8.5	12.00	10.0	89	7.8

The values given in Table III (a) are plotted on the accompanying diagram and from the curve the volume of water can be read that any concentration of camphor dissolved in 95 percent alcohol should take to form a permanent precipitate.

A table is given below to show the results of these experiments on a number of samples of spirit of camphor which were found low in camphor and were tested for added water.

TABLE IV.

No.	Gms. Cam. found per 100 cc.	% Alc. by calc.	Cc. H ₂ O to titrate 100 cc. Sp. Cam.	Dif. from standard value.
1.....	6.10	93.2	12.0	-1.0
2.....	8.47	94.9	10.5	-0.3
3.....	5.5 (6.5) corr.	67.7	4.2	-10.0
4.....	8.24	94.3	10.7	-0.3
5.....	8.37	94.3	10.7	+0.1
6.....	8.78	94.5	10.4	-0.2
7.....	9.22	94.1	9.7	-0.5
8.....	9.04	94.9	10.4	0.0
9.....	8.8 (9.2) corr.	83.2	7.7	-2.9
10.....	7.06	94.1	11.7	-0.5
11.....	9.00	94.1	10.2	-0.2

It will be noticed that in all cases except three the percentage of alcohol does not exceed 94.9 percent (the U. S. P. strength) or is it less than 94.1 percent, making a total variation of only 0.8 percent. In the three cases where the percentage of alcohol is low the volume of water necessary to produce a permanent precipitate is abnormally low indicating that some water is already present. Excepting these three cases the volume of water is in no instance more than 0.5 cc. away from the standard value. Numbers 3 and 9 have been considerably diluted. Number 1 may have been put into a wet bottle in its preparation, but the percentage of alcohol is not low enough to consider the sample adulterated.

The factor for the determination of alcohol can be restated so as to be used in any specific gravity apparatus. The grams of water necessary to fill the pycnometer used for the determination at 20° C. multiplied by .000723 will give the factor for that apparatus.

CONTRIBUTED FROM THE SOUTH DAKOTA STATE FOOD AND DRUG LABORATORY, VERMILION, S. D., Dec. 8th, 1913.

WRIGTH'S STAIN—MODIFIED.

R. A. KUEVER, IOWA CITY, IA.

This polychromic stain, originally known as Romanowsky's stain, has had many modifications. In principle, they all depend upon the loose chemical combination of eosin (tetrabromofluorescin) with methylene-blue, these dyes staining not only as units but acting together when properly combined. The two in solution in the same solvent, therefore, contain at least three compounds, each of which colors the various structures of the specimen, selectively.

This particular modification yields an eosinated methylene-blue solution which will not only produce a strong differential stain but simplifies the technic of both the preparation of the stain and the staining of specimens, and it gives more uniform results.

Solution No. 1.

Methylene-blue (Merck).....	5.0
Sodium bicarbonate	2.5
Distilled water	500.0

Place the methylene-blue and the sodium bicarbonate in a 1000 cc. flask, add the distilled water and connect the flask with a twelve inch reflux Liebig condenser. Transfer this apparatus to a water-bath and heat for two hours, and then cool.

Solution No. 2.

Tetrabromofluorescin (Merck)	4.0
Water, distilled	250.0

Dissolve the tetrabromofluorescin in the distilled water by agitation or stirring.

After solution number one has cooled to 20° C., add solution number two slowly and with frequent agitation. Collect the precipitate thus formed on well-wetted filter. While it is still wet dissolve it in 60 cc. of hot methyl alcohol (acetone free), and again filter. Evaporate this solution to one-half its volume and set aside for the eosinated methylene-blue to crystallize. Collect the crystals thus formed and after they have been dried spontaneously, transfer them to a well-stoppered, amber-colored bottle.

THE STAIN.

Eosinated methylene-blue1
Methyl alcohol	100.0

Dissolve by agitation.

The methyl alcohol should be acetone free and the eosinated methylene-blue should be made by the above process.

This stain, like all polychromic stains, decomposes rather rapidly and should therefore be made in small quantities. Amber bottles will retard the decomposition somewhat.

METHOD OF STAINING.

Pour the stain over the surface of the specimen until it covers it and allow to remain for from fifteen seconds to one minute; this period of time varying with the thickness of the specimen. This serves to fix the film to the glass as well as to stain it, so it is not necessary or desirable to pass the preparation through the flame. Now add distilled water, drop by drop, until a slight metallic

scum is produced on the surface of the stain. At this point a precipitation occurs and the real staining takes place which takes from five to ten minutes. Next wash in distilled water for several minutes or until the thin parts of the specimen have acquired a yellowish tint. The differentiation may frequently be brought out more plainly by washing longer.

If the blood-smear, as an example, stains a uniform deep-blue, distilled water will bring about a differentiation, removing the blue from the acidophilic parts, leaving them well stained with an eosin color.

The differentiation produced by this stain is as perfect as can be obtained by any of the eosinated methylene-blue combinations, and is being used with a great deal of success on blood-smears, demonstration of bacteria in cellular exudates, pus, etc.

DETERIORATION OF NITROGLYCERIN TABLETS.

J. R. RIPPETOE AND N. SMITH.

Although within the past five or six years several prominent pharmaceutical chemists have expressed the opinion that nitroglycerin tablets are a stable preparation, there are still some who believe in their instability and that the deterioration is chiefly due to volatilization.

In 1907, Bernegau¹ stated, that "the loss of nitroglycerin appears to be in the granulation process, and that the tablets themselves are fairly constant" and Dohme² in the same year stated "that observations made in his laboratory appear to indicate that tablets of nitroglycerin do not deteriorate perceptibly in course of time." In 1908, Gane and Webster³ referred to "nitroglycerin as a stable compound" and Edmunds and Roth⁴ find that "contrary to the common opinion, nitroglycerin tablets do not deteriorate greatly with age." Again 1909, Dohme⁵ comments upon a "comprehensive investigation of the deterioration of the tablets, that disprove the claim that these tablets deteriorate rapidly" and very recently Vanderkleed⁶ stated that "nitroglycerin tablets when properly made are to be classified among the more stable products, * * * and the tablets will remain unchanged or practically so, for a considerable length of time."

The last comment was in reply to an editorial article referring to the very unstable nature of nitrolycerin tablets due to loss by evaporation.

Until the phenoldisulphonic acid method was proposed by Scoville⁸ and its modification by the Bureau of Chemistry,⁹ and also the May method,⁹ there was no very reliable method for accurately determining nitroglycerin in tablets. We have found the modified Scoville method to be a very practical and reliable method.

The purpose of this paper is to report the results of several experiments and while not covering a very long period or many samples, we believe the figures are quite sufficient to demonstrate the stable nature of nitroglycerin tablets.

Samples of 0.01 (1/100) and 0.02 (1/50) grain hypodermic tablets, which were assayed on April 12, 1912, having been made sometime previous, were set aside on a laboratory shelf in ordinary cork stoppered glass tubes of

about 100 each. These tablets were again assayed by the modified Scoville method on Nov. 12, 1913, with the results as shown in the following table.

	April 12, 1912	Nov. 12, 1913
0.02 grain	0.0150 gr.	0.0149 gr.
0.01 grain	0.0061 gr.	0.0057 gr.

These tablets while they were deficient in nitroglycerin when made show practically no loss during a period of 19 months.

A 10 percent solution of nitroglycerin (strength was not confirmed by analysis) was mixed with sugar of milk to give a nitroglycerin content of 5 percent. This mixture upon analysis was found to contain 4.13 percent of nitroglycerin. A quantity of hypodermic tablets was made up from this mixture using the theoretical amount based upon the above analysis to give a tablet assaying 0.01 grain. The tablets upon assaying were found to contain 0.0102 grain nitroglycerin. These tablets were hand made while a lot of tablet triturates, which were made from a granulation on a machine using the same quantities as above assayed 0.0093 grain nitroglycerin.

The hypodermic tablets were also assayed by extracting with ether, allowing the ether to evaporate spontaneously and drying in a vacuum desiccator, over sulphuric acid, and found to contain 0.0114 grain residue (nitroglycerin?) which residue when assayed by the modified Scoville method yielded 0.0095 grain per tablet.

A lot of 0.02 grain tablet triturates made in 1907 were assayed in October, 1907, by the ether extraction method and appeared to be of full strength, but as shown above, this method gives too high results, and the saponification method proposed some years ago gives still higher results.

Two bottles each containing about 100 of these 0.02 grain tablets, were set aside in a closet, one of the bottles being corked and the other having only a piece of muslin over the mouth of the bottle to exclude dust. These tablets were assayed in November, 1913, by the modified Scoville method after having been stored as stated above for six years with the following results.

Tablets in stoppered bottle.....	0.0130 grain
Tablets in unstoppered bottle.....	0.0040 grain

In all probability these tablets would not have assayed, by the modified Scoville method, much over 0.015 grain when made. (Compare assay tablets in first experiment April 12, 1912.)

Conclusions: It is apparent that nitroglycerin will volatilize in the process of making the tablets if the granulation is exposed for any length of time, but after compressing the tablets and storing in ordinary corked bottles very little deterioration takes place.

The tablets will lose in strength if exposed in unstoppered bottles, therefore containers that are not air tight such as card board boxes should not be used.

THE POSSIBILITY OF INCREASING THE ALKALOIDAL CONTENT OF BELLADONNA PLANTS THROUGH SELECTION.*

A. F. SIEVERS, BUREAU OF PLANT INDUSTRY, U. S. DEPARTMENT OF AGRICULTURE.

For a good many years importers and jobbers of drugs have experienced difficulty in supplying certain drugs of the required strength. Even previous to 1900, the belladonna and stramonium which could be secured was alleged to be of such inferior quality that it was impossible to furnish sufficient quantities of these drugs of the Pharmacopœia Standard. This difficulty was finally recognized by the revision committee of the eighth decennial revision of the Pharmacopœia, and the required strength of each of these drugs reduced by .05 percent of alkaloids.

Whatever may have been the wisdom of making this reduction in the standards, the fact that it was made first called serious attention to the apparently growing inferiority of some of the important official vegetable drugs, a situation which was viewed with considerable alarm, for if any further deterioration should take place in the future, as seemed very likely, it would become necessary in time to still further reduce the standards with the consequence of bringing a lot of inferior material on the market. The rapidly diminishing supply of belladonna from the wild state makes its cultivation in the near future practically a necessity and since cultivation of a naturally wild plant often results in decreasing its strength, it seemed highly desirable that something be done to improve the quality of this plant.

While the Solanaceous group of plants are not by any means the only ones which could be improved to advantage, the Office of Drug Plant Investigations in taking up this problem selected this group on which to begin the study of medicinal plant improvement for several reasons. In belladonna and hyoscyamus the group includes two of probably the most important and most widely used vegetable drugs. Two of the members of this group were largely responsible for the attempt to investigate this question in that the widespread inferiority of the official material they furnished necessitated the lowering of the Pharmacopœia standard, thus calling attention to a question of grave importance. The active principles which they contain being definite chemical compounds which admit of definite quantitative determinations the plants lend themselves well toward studying individuals. Finally, belladonna, being a perennial, can be studied through a number of successive seasons which is a further distinct advantage.

The investigation was started on its present scale in the spring of 1911. The first step was entirely in the direction of studying a large number of individuals to determine the following principal points: (1) Is there a deterioration in the belladonna plant under cultivation, in so far as its medicinal quality is concerned? (2) If such is the case is the deterioration general of the whole plant or is it found only among certain individuals? (3) Does this individual characteristic

*Read before the City of Washington Branch, October 15, 1913.

manifest itself at different stages during the growing season? (4) Is there any relationship between the medicinal value of the plant and its physical appearance or in other words, its vigor, growth, and general thriftiness? (5) Is a high alkaloidal content in an individual plant of perennial occurrence or does it only occur in one season?

The season of 1911 was started with 59 individual plants under observation. Each plant was carefully watched as to growth and appearance with a view towards finding some striking physical characteristic which might later serve as a type. Samples of the leaves were collected at the following stages of growth: First stage, during the early part of May before the flowers appeared; second stage, during the latter part of May when the plants were in full bloom; third stage, about the middle of June when the berries were developing in various stages of maturity; fourth stage, early in September when the berries were mostly ripe; fifth stage, about the middle of October after the plants had made considerable growth of new leaves. Practically the same plan was followed in 1912 with the same list of plants.

The results of the two years' investigation show two interesting facts. Taken as a whole, the plants under cultivation at Arlington for these experiments show a comparatively high alkaloidal content in their leaves. Of the 59 plants in the list, not a single one fell below the present standard of .3 percent in its season average for either year and only one assayed below the old standard of .35 percent. This would seem to show that in this particular location at least, belladonna plants can be grown under cultivation which may be expected to yield a product considerably above the standard required at present.

The other striking fact brought out is the wide range of variation in the alkaloidal content of the individuals. Table I shows the maximum and minimum percentage found at each stage of growth among the 59 plants at Arlington, 10 plants at Madison, Wisconsin, and 19 plants at Bell, Maryland.

Alkaloidal Content During Successive Seasons.—It having been fairly well established that the characteristic of a high or low alkaloidal content in certain individuals manifests itself during the entire growing season we come to the question of the perennial consistency of such a characteristic. This is of prime importance for the possibility of improvement by selection depends on it. If it is found that a plant selected for its high content of alkaloids one year is only of ordinary quality the following season, it would seem likely that seasonal influences are mostly responsible for the relative development of alkaloids and that such a property could not be used to advantage as a basis for selection. If, on the other hand, it is found that the high alkaloidal characteristic exists in the same plant through a number of seasons it is logical to assume that the property of forming large quantities of those alkaloids is an inherent characteristic in that particular individual plant in distinction from the others grown under similar conditions.

In Table II in which the analyses of typical plants are shown for two seasons, we find that these plants display the same characteristic throughout both seasons. Numerous other plants can be selected from the list under observation. It would seem that in plants which are conspicuously rich or poor in alkaloids, as numbers 6w and 7w and numbers 3 and 34, the tendency to produce such large or small quantities of alkaloids constitutes a definite characteristic which is manifested by that individual plant throughout its existence in much the same way as certain types of sugar beets produce a conspicuously high or low percent of sugar.

Relation of Physical and Chemical Characteristics.—As previously stated, the plants under investigation were carefully noted as to their physical appearance with a view to finding some relationship between that and the alkaloidal content. Thus far, nothing has been found to indicate that such a relationship exists.

The belladonna plant is almost entirely lacking in any distinctive physical features, any one of which might serve as a distinct type. While the size of each plant, the number of stems it has and its general thriftiness have been noted, nothing has been found which is characteristic of any one individual. It would be a distinct advantage if plants of a desirable alkaloidal content could be identified by means of some distinctive physical feature since that would make the tedious assay process unnecessary in many cases.

Method and Results of Selection.—It having been established that the variation in the alkaloidal content of belladonna plants can possibly be made the basis for the improvement of the plant, the next step in the problem is to apply the methods of selection. The belladonna plant may be propagated by seed or by cuttings. The flowers of the plant are well adapted to insect fertilization and in order to insure close pollination, bagging or screening is necessary. In selecting the plants to be used, types of very good, very poor, and average alkaloid producing individuals were chosen. While the plants of poor alkaloidal content are of no economic significance they were included so as to give more extensive data on the possibility of reproducing in successive generations the characteristics regarding alkaloid production.

In 1911, the attempt to secure close-pollinated seed was not successful. Open pollinated seed from the selected individuals were sown in the greenhouse in January and in April the seedlings were set out in the plat. The plants made a slow but steady growth and on the 23d of July, when the plants were in full bloom, the first picking was made. The number of plants secured from each selected parent varied from six to fifteen. No individual picking was made, but a general representative sample of leaves was secured from all the plants from each selected individual. On August 30th, when the berries were partially ripe, a second picking was secured in the same way. Of the five plants of high alkaloidal content shown in Table II, numbers 21 and 29 died of a root disease before seeds could be secured and number 1w was in such a diseased condition that the seeds which were secured failed to germinate. Numbers 6w and 7w and also numbers 12 and 13, each rich in alkaloids, yielded first generation plants from their seeds. Plants were also secured from the seed of numbers 3, 34 and 19, all plants of low alkaloidal content. Table III shows the results of the assays.

TABLE III.

Percentage of Alkaloids in the Leaves of First Generation Plants Grown from Seed from Selected Individual Plants.

	Percent of Alkaloids, Parent	First Stage	Second Stage	Average
3	Low	.524	.693	.609
34	Low	.479	.518	.498
19	Low	.493	.519	.506
12	High	.650	.882	.766
13	High	.640	.859	.750
7w	High	.617	1.063	.840
6w	High	.805	1.282	1.043

Attention is directed here to the striking superiority of plants 6w and 7w

over the others. Leaves from the second picking of 6w contained a percentage of alkaloids probably never met with previously in belladonna.

During the past summer, these plants have all been picked individually and while only a few of the samples have been assayed, the results so far indicate quite clearly that the individuals from 6w will average much higher than any of the others. This would go further to show that the individual plant 6w which shows to such advantage through 1911 and 1912 and whose first generation reproductions rank highest collectively the first season will serve as a good type to form the basis of further propagations. During 1912, close pollinated seeds were secured from this and several other good types and the plants from these seeds are now making their first year's growth and are being examined and tested individually. The parent plant 6w is now dead, but it is hoped that some of its reproductions will continue to prove equally good if not better. This fall cuttings are being made from the most desirable plants and it is believed that this method will prove the quickest and most productive means of propagation.

Some General Considerations.—The problem under discussion, like most problems in plant breeding and selection, must extend over a good many years. What has been accomplished thus far constitutes practically merely a beginning because we have not yet embarked on any breeding operations, but have only supplied the information and material necessary to make the application of the proposed methods possible. However, while in the actual solution of the problem only a step has been made, the future work will likely entail much less actual labor in that the many analyses which were necessary in the earlier phases of the work can be largely dispensed with and the investigation limited to a few selected plants.

It has no doubt occurred to you that the increase of alkaloids in the plant will in itself alone not relieve the economic situation. From what has been said of the relationship of the size and thriftiness of the plant, there exists the possibility that the plant richest in alkaloids may also prove to be a poor type from an agricultural standpoint. The ideal plant must, therefore, combine chemical and physical excellence in order to constitute the best plant from both the therapeutic and agricultural standpoint.

Much has been said and written regarding the influence of soil and climate on the production of alkaloids and the conclusions reached have varied greatly. In view of the great variation existing in individual plants as shown here, grown under identical conditions as regards soil and climate, it must be plain that little if any importance can be attached to experiments designed to show the influence of these factors until a type of plant can be secured which shows the minimum amount of individual variation. Numerous instances are found in literature where differences in the alkaloidal content of belladonna plants which are claimed to be the results of fertilizers or climatic conditions are considerably less than variations found in the fifty-nine plants here studied. There is no doubt that environmental factors have some influence but the extent of such influences can not be studied under present conditions with any degree of certainty.

This investigation has offered us a splendid opportunity to study the belladonna plant itself. Time will not permit the discussion in any detail of the various points of interest that have been worked out in this connection. Suffice it to

say that we have found a practical way to grow belladonna from seed that eliminates the difficulties of field sowing. The various details regarding the germination of the seed have been worked out. Furthermore, the abundant material on hand made it possible to study thoroughly the distribution of the alkaloids in the various parts of the individual plant; the development of alkaloids in the seedlings and early stages of growth and the relative concentration of alkaloids in the leaves with relation to age and size.

As has already been said, belladonna was chosen for this work for certain reasons. If the problem is finally brought to a successful conclusion its value will lie not so much in what has actually been done with one plant as in the fact that it points the way to the possibility of a broader application of similar methods to our field of medicinal plants.

SENSITIZED VACCINES.*

F. E. STEWART, PH. G., M. D.

Sensitized Vaccines, Sero-Vaccines, or Sero-Bacterins, are suspensions of pathogenic bacteria, living or dead, artificially sensitized by treating them with immune homologous serums, i. e., serums from animals immunized against bacteria of the same kind as those used for producing the Vaccines. By this means the amboceptors contained in the immune serums are made to combine with the bacteria and sensitize them, so when they are injected into the body the complement and phagocytes normally present in the blood of the injected individual immediately combine with and digest them, and the resultant products stimulate the tissue cells to produce antibodies to which the subsequent immunity resulting from the vaccination by the sensitized vaccine is due.

How the Immune Serum is Obtained.—The immune serum for making sensitized vaccines is usually prepared by treating goats intravenously, first, with dead, and later with living cultures of bacteria. Trial bleedings are made at regular intervals, and the serum is tested for amboceptors and other specific antibodies. When the serum shows a sufficiently high titre, a large quantity of blood is withdrawn for use in preparing the sensitized vaccine.

How Vaccines are Sensitized.—The bacterial cultures to be sensitized are added to a little physiological salt solution, emulsified, turned into a vessel containing the immune serum, allowed to macerate for a few hours, the clear and slightly opalescent liquid separated from the deposit of bacteria, and the latter washed by centrifugalization several times in physiological salt solution until the last traces of serum disappear. The white mass thus obtained is of a pasty, semi-liquid consistency, and after standardization by bacterial count, and the addition of physiological salt solution in proper amounts, produces an entirely homogeneous emulsion which constitutes the sensitized vaccine.

*Read before the Seaboard Medical Association, Norfolk, Va., December 9, 1913.

How Sensitized Vaccines Were Introduced to Science.—Sensitized Vaccines were introduced to science in 1902 by Besredka, a scientist connected with the Pasteur Institute, and have gradually and progressively attracted as knowledge concerning them has been developed by Besredka and his associates. Among the latter are Garbat and Meyer, Gordon, Broughton-Alcock, Boinet, Cruveilhier, Bertrand and Feigan, and other investigators. The researches have been carried on at the Pasteur Institute and l'Hotel Dieu, Paris, also at St. Bartholomew's Hospital, London, and other well-known institutions. One of the sensitized vaccines, that is used for immunizing against bubonic plague, is prepared from killed sensitized plague bacilli, and is now official in the French Codex.

What is Meant by Sensitization.—Normal blood serum, owing to the alexin or complement it contains, and the small amount of natural amboceptor present in the blood, possesses in some degree the power of digesting bacteria and other protein substances. This power is enormously increased during the process of parenteral digestion. This is due to the stimulating effect upon the tissue cells of the protein introduced. For, if a protein is introduced into the tissues, the tissue cells are stimulated to produce a specific amboceptor, the function of which is to sensitize the protein and thus prepare it for digestion. This digestion is accomplished by the joint action of amboceptor and complement. (Vaughan says that all digestive enzymes are composed of amboceptor and complement.)

But the complement cannot act upon the protein until the latter is first sensitized by the amboceptor. Amboceptors are *specific*, and the kind of amboceptor produced by the tissue cells depends upon the kind of *antigen* (protein) used to produce it. The digestion is called *lysis*. Hence we have bacteriolysis produced by the joint action of specific bacteriolytic amboceptor and complement upon the kind of bacteria injected into the tissues.

When unsensitized killed bacteria (bacterin) are injected into the tissues, all of this complicated process of parenteral digestion must be carried on by the body cells to produce the specific amboceptor and other antibodies to which the value of the bacteria as an immunizer is due. In preparing sensitized vaccine, the bacteria are artificially sensitized by the amboceptor in the specific (homologous) serum before injection, and thus prepared for the immediate action of the complement already present in the blood of the individual injected.

For What Sensitized Vaccines are Used.—Sensitized vaccines are used against typhoid fever, rabies, plague, cholera, and other infectious diseases, and are also employed in their treatment. Several thousand people have been immunized by their use, and they have also been quite extensively employed as therapeutic agents by many competent observers. Further researches are necessary to determine their merits in comparison with bacterial vaccines prepared by the Wright method, also to ascertain the comparative value of sensitized vaccines prepared by sensitizing living cultures and cultures killed by heat.

How Sensitized Vaccines Act: Garbat and Meyer's Explanation.—In explaining the action of sensitized vaccines, Besredka refers to the researches of Garbat and Meyer. These investigators claim that bacteria are typical cells consisting of an external protoplasmic envelope and an internal nuclear portion. When they are disrupted by the action of amboceptor and complement, the outer portion is

digested and the inner portion set free. Both portions are toxic; both give rise to individual immunizing substances by stimulating the tissue cells to produce them.

Vaughan's Explanation.—As the explanation of Garbat and Meyer resembles in some particulars the teachings of Vaughan and his associates, I wrote to Professor Vaughan in regard to sensitized vaccines, and asked further information on the subject from his view-point. His reply proved very interesting to myself and friends, and became the subject of considerable debate. Thinking that you might be interested in Professor Vaughan's letter and also in the debate following its reading, I am now presenting both to you for consideration. My paper also contains valuable information taken from the papers of Besredka and his followers, and pertaining to the subject before us:

ANN ARBOR, MICH., November 8, 1913.

DEAR DR. STEWART—It seems to me that the action of sensitized bacteria compared with unsensitized bacteria is best explained by my theory. Probably it will be best to first state my theory and then see how it applies to sensitized bacteria. A protein sensitizer or anaphylactogen (called by others antigen) is a protein substance which when injected into animals causes certain body cells to produce a specific proteolytic ferment. This specific ferment digests and destroys its homologous sensitizer or the protein which has caused its development. This ferment, like all other ferments, consists of amboceptor and complement. Now let us apply this to sensitized bacteria. Bacteria, typhoid bacteria for instance, are sensitized by submitting them in vitro to immune serum. These bacteria thus are saturated with their specific amboceptors and when such sensitized bacteria are injected into an animal they are already fitted for complete digestion. In the animal the complement acts upon the prepared bacteria and their digestion is complete. So complete is their digestion that a large part of their poisonous constituents is destroyed and the animal is immunized by the non-poisonous constituent of the sensitized bacteria. For this reason the animal treated with sensitized typhoid bacteria shows little disturbance, while on the other hand, the animal treated with unsensitized bacteria must elaborate both amboceptor and complement. This takes time, the period is longer, the digestion is less complete, more of the poison is set free, less of the poison is destroyed in the process of digestion, and consequently the life of the animal is placed in greater jeopardy. Garbat and Meyer believe that immunization is secured only by the poisonous constituent, or constituents of the typhoid bacillus. According to my theory, the poisonous constituent of the typhoid bacillus has nothing to do with the production of immunity or sensitization. Sensitization and immunity are induced by the non-poisonous part of the typhoid bacillus. Subjecting the typhoid bacillus in vitro to immune sera, in other words, sensitizing the bacteria in vitro, prepares the bacteria for digestion, and when introduced into the body they are digested speedily and completely, or so nearly completely that a large part of the poisonous part of the bacterial molecule is destroyed. It seems to me that if the article by Garbat and Meyer is read with my theory in view, it is confirmatory of that theory. It has been shown by Friedberger, myself, and others, that very small amounts of the protein poison produce an elevation in temperature. Large amounts produce a depression in temperature. Sensitizing with immune serum in vitro prepares these bacteria for ready and complete digestion as soon as they are introduced into the animal body. Therefore, there is less disturbance in the animal body when sensitized bacteria are introduced than when unsensitized bacteria are given. This is the way I look at it.

I don't know whether I have made myself clear on this point or not. I know that I have been able to sensitize animals with the non-poisonous part of typhoid bacteria. This non-poisonous part which I have obtained has been secured by a crude method. The non-poisonous part which is split off by sensitizing bacteria with immune serum is a much more efficient preparation than mine. The point that I insist upon is that the sensitizing group in the protein molecule, and this of course means the immunizing group, is not the poisonous group, but is found among the non-poisonous groups. The poisonous group in all proteins is much the same, physiologically the same, chemically there must be fine differences, while the sensitizing group is not the same in any two kinds of proteins; hence its specificity.

I may be cranky on this subject. I think that the nomenclature of Ehrlich has been wrongly applied to sensitization and to bacterial immunity. The protein poison is not a toxin; it is a poison. It produces no antibody.

Yours,
V. C. VAUGHAN.

Parenteral Digestion in Relation to Infection and Immunity and the Action of Vaccines.—This letter of Vaughan becomes far more interesting after reading

his most instructive book entitled "Protein Split Products in Relation to Immunity and Disease."¹

In his book he explains how the tissue cells of the animal body have the power of digesting and producing enzymes for so doing. Digestion carried on outside of the alimentary canal by the tissue cells is called by Vaughan "Parenteral Digestion."

The questions arise why bacteria, many kinds of which live as commensals (at the same table) on the skin and mucous membranes of the body, feeding as saprophytes on dead matter, including worn-out epithelial cells, excrementitious matter, particles of food, etc., do not attack the living tissues and become parasites? And, in case they do become parasites, and obtain their sustenance by preying upon the tissues, how does the body get rid of them?

Vaughan attempts to answer these questions in his way, Metchnikoff has another way of answering them, Ehrlich another, Wright another, Besredka another, and so on. Each of these views resembles each other in many respects, and diverge in others. They cannot all be harmonized and I shall not attempt in this debate to harmonize them. But there are certain points which need connecting to make the subject before us intelligible to those who have been following Wright in his theories of infection and immunity, and employing Wright's bacterial vaccines in their practice. Besredka's sensitized vaccines appear to be a marked improvement upon Wright's products, and it is an important matter for us to decide whether they are or not. Let us therefore consider the theories underlying the subject, hoping to get a clear idea of Besredka's claims and the investigations upon which they are founded.

In answer to the questions, why do not the bacteria living with us as commensals become parasites, and when they do become parasites, how does the body get rid of them, all authorities agree in the following answers: The tissues of the body possess natural resistance to the action of enzymes, including the action of the enzymes secreted by the bacterial cell. This resistance, when especially marked, is called *immunity*. When bacteria succeed in overcoming this resistance, and invade the body as parasites, the tissue cells secrete specific enzymes which digest and destroy them.

According to Vaughan, infectious diseases are groups of symptoms caused by the parenteral digestion of bacteria, especially by the splitting up of the bacterial protein. This, Vaughan teaches, is split into several portions, viz., a primary chemical group, or archon (keystone), with which are connected secondary or even tertiary groups. When the protein molecule is split up by disrupting agents, including digestive ferments, the archon is set free to a greater or less extent. This archon is poison. Its poisonous character is due to its great affinity for the secondary groups. When the secondary groups are digested the archon aids the digestive enzymes in breaking down fresh protein molecules, and the digestion proceeds onward. The primary, or poison group causes the toxic symptoms of the infectious diseases. The non-poisonous or secondary group stimulates the

¹"Protein Split Products in Relation to Immunity and Disease," by Victor C. Vaughan, M. D., LL.D., published by Lea and Febiger, Philadelphia and New York, 1913.

tissue cells to produce a special and specific proteolytic ferment or enzyme which has the power of rapidly digesting and destroying the homologous protein. Immunity to another attack of the disease is due to the rapid digestion of the invading bacteria upon subsequent exposure. The bacteria are thus destroyed before they have an opportunity to multiply.

Vaccines are prepared by attenuating by various means the disease-producing bacteria so that they are unable to cause infection, yet the bacterial protein still retains the power to produce the specific proteolytic ferment upon which immunity depends,—that is, according to the hypothesis of Vaughan. When a vaccine is used in the treatment of an infectious disease, this proteolytic ferment is produced in excess of the quantity required to digest the vaccine itself, and the excess is employed in digesting and destroying the invading pathogenic bacteria.

Various Teachings Compared with the Teachings of Vaughan.—We are taught by Metchnikoff that invading disease germs are destroyed by the white blood corpuscles or leucocytes, called by him phagocytes or “cell eaters” because they ingest and digest the bacterial cells. This does not conflict with that of Vaughan, for the phagocytes undoubtedly depend upon the ferments they contain for their proteolytic function.

How about the teachings of Ehrlich and his associates? They say that the destruction of invading bacteria is accomplished by the action of amboceptor and complement upon them, and that the value of bacterial vaccines lies in the fact that their injection into healthy tissues stimulates the tissue cells to produce a large excess of amboceptor which sensitizes the invading bacteria and thus prepares them for the destructive action of complement. *How does this view agree with that of Vaughan?* It is immediately apparent that the only difference is essentially one of terminology.

How do Vaughan's teachings agree with those of Wright, who says that the invading bacteria are destroyed by phagocytes only after they have first been prepared for ingestion by opsonins? It is evident that the opsonic properties of the serum are merely a manifestation of the action of the specific proteolytic ferment.

How does the explanation of the action of sensitized vaccine given by Garbat and Meyer and endorsed by Besredka, harmonize with that of Vaughan? This question is answered by Vaughan himself as follows: “Garbat and Meyer believe that immunization is secured only by the poisonous constituent, or constituents of the typhoid bacillus. According to my theory, the poisonous constituent of the typhoid bacillus has nothing to do with the production of immunity or sensitization. Sensitization and immunity are induced by the non-poisonous part of the typhoid bacillus.”

The Relative Value of Living and Killed Sensitized Bacteria for Immunization.—In Besredka's earlier experiments killed bacteria were used. Further investigations, first on animals and then on man, demonstrated the harmlessness of certain sensitized living bacteria, and in anti-typhoid immunization the sensitized living bacteria are now preferred by Besredka and his followers.

Why are living bacteria preferred? It is generally conceded by authorities that immunity obtained by living viruses is more substantial than that resulting from

the use of killed virus. However, up to April, 1913, Broughton-Alcock has "seen no advantage of the living sensitized gonococci over those allowed to die."² Is there no danger of carrying contagion with living sensitized pathogenic bacteria? Besredka claims that there is no more danger of carrying contagion from living sensitized bacteria than there is from living smallpox vaccine, and that there is no danger from either.

Are sensitized bacterins prepared from killed cultures superior to unsensitized killed bacterins? Yes, according to Besredka, "Whatever be the nature of the virus, whether it be a question of bacteria of pest, of dysentery, of cholera, or of typhoid fever, whether it be a question of rabies virus, of diphtheria toxin, whether the bacteria are killed or living, sensitization confers upon them new properties which make them vaccines of the first order, and which are characterized by an action, sure, rapid, harmless, and durable."

How do unsensitized living bacteria compare with unsensitized killed bacteria for the production of immunity against typhoid fever? Results obtained by Besredka and Metchnikoff in the immunization of chimpanzees against typhoid fever demonstrates that sensitized living germs gave absolute protection, causing but slight fever and reaction, while killed bacilla failed to protect adequately.

Is there no danger of acute infection from such procedure? Apparently the method is harmless, as Besredka reports that about ten thousand persons, men, women, and children, have been vaccinated without a single mishap of any kind.

Is there no danger that in some persons the injection of living bacilli might lead to the development of a carrier state? No cases of the kind have been reported in relation to the ten thousand persons immunized. Seven hundred of these cases were tested, and no typhoid bacilli found either in the feces or urine.

How do Besredka's results with living sensitized cultures compare with those obtained by the armies of the United States and of foreign countries with killed cultures? The results obtained by immunization with killed typhoid cultures in the armies of the world abundantly demonstrate that adequate protection against typhoid fever is obtained in this manner. However, according to Besredka's general verdict concerning the improvement in the vaccine produced by sensitization itself, killed sensitized vaccines are superior to killed unsensitized vaccines in all cases.

Sensitized vs. Unsensitized Bacterins. Is there anything to be gained by using sensitized killed bacteria for immunization? According to the statement by Besredka above quoted, there are many advantages to be gained by sensitizing the killed bacteria before injecting them for protective purposes.

What are the advantages? Freedom from the negative phase, freedom from local soreness and freedom from marked systemic reactions, and more rapidly acquired immunity.

What is meant by more rapidly acquired immunity? Experiments in the British army demonstrated that antibody formation following a dose of unsensitized killed bacteria administered for the prevention of typhoid fever, requires several days, and does not reach its maximum until the ninth or tenth day. Experiments

²"Vaccination for Various Infections with Living Micro-organisms," by W. Broughton-Alcock, *Lancet*, London, April 26, 1913.

by Besredka and his followers demonstrated that the maximum immunity following an injection of sensitized bacteria is reached in from twenty-four to forty-eight hours.

Dosage. What doses should be employed, and at what intervals should they be given, when killed sensitized bacteria are used for prophylaxis against typhoid fever? Want of experimental data on this subject makes of this a hypothetical question, requiring an answer of similar character. In the first place, if we accept Besredka's general verdict to the effect that sensitization confers upon bacterial vaccines certain properties which markedly increase their efficacy, whether prepared from living or killed cultures, we must apply the verdict to killed sensitized typhoid bacilli. Secondly, the doses successfully employed by Besredka's associates in treating typhoid fever are very much larger than the doses recommended by Wright and his followers for therapeutic use, when killed cultures are employed. Broughton-Alcock's impression from experience is that great value lies in large doses. He begins with 500 to 3000 million killed gonococci, and has also found it to be a safe and beneficial procedure to commence with 20 million killed staphylococci and 200 million killed gonococci.

What dosage should be employed in the treatment of infectious diseases? Gordon reported excellent results from the use of killed sensitized streptobacterin in a series of cases treated at St. Bartholomew's Hospital. He employed the "intensive" method, which consists of giving rapidly increasing doses at brief intervals. The dosage in the four following cases illustrates his method:

In Case 1—(A girl suffering from erysipelas) he administered 100 million sensitized streptococcus vaccine as the initial dose, 24 hours later 500 million, and on the following morning 1000 million. Three days later the child was quite well.

In Case 2—(A nurse with cellulitis of the scalp and cervical adenitis), the patient was given an initial dose of 100 million, the following day 500 million, and 24 hours later 1000 million. Two days later the erysipelas subsided, the temperature fell, and convalescence ensued.

In Case 3—(A patient suffering with an acute attack of erysipelas of the forehead and cheeks), three successive doses of 100, 500 and 1000 million sensitized streptococcic vaccine were given at 24-hour intervals, followed by a prompt cure.

In Case 4—(A patient who suffered from a compound fracture of the lower end of the left humerus which had suppurated, and cultures from which showed streptococcus pyogenes), a single dose of 100 million (this may be a typographical error; possibly 1000 million is meant) sensitized streptococcus vaccine was given. The local condition improved and the pyrexia subsided.

The dosage employed by Boinet in treating typhoid fever illustrates another system of dosage. He says: "The best results follow the use of doses of 2 cc., repeated daily during four consecutive days, if the disease is grave, but three consecutive days if the disease is mild." He used the living sensitized germs.

In reporting cases, other observers, while careful to state intervals, neglect to inform us as to the size of the doses. Broughton-Alcock reports cases of gonorrhea, acne, sycosis, furunculosis, impetigo, and seborrheic eczema, treated with appropriate sensitized living bacteria. In cases of acute and chronic gonorrhea without complications, the serobacterin was apparently without benefit. In cases of orchitis, epididymitis, and in gonorrheal arthritis and peri-arthritis, good results were invariably secured. In every case following the second injection, and in many cases following the first injection, the pain ceased and the swelling was notably diminished. The arthritis and peri-arthritis were arrested. To avoid

relapse, the injections were repeated. It is important to know the size of doses and intervals to give these reports proper educational value.

Summary of Besredka's Claims in Regard to Sensitized Bacterins.—The most striking characteristics of sensitized vaccines are:

1. They produce but slight local reaction (inflammation at site of injection),
2. They cause no general reaction (malaise, increased temperature, etc.),
3. They may be given in much larger doses and much more frequently than the unsensitized bacterins (every 24 hours),
4. The immunizing effect is almost immediate (manifesting itself within from 24 to 48 hours),
5. They sometimes give successful results in very late stages of a disease, when no response is secured from the ordinary bacterins, and even serum treatment is ineffective."³

According to Besredka, "whatever be the nature of the virus, whether it be a question of bacteria, of pest, of dysentery, of cholera, or of typhoid fever, whether it be a question of rabies virus, or diphtheria toxin, whether the bacteria are *killed* or *living*, sensitization confers upon them new properties which make of them vaccines of the first order, and which are summed up in an action *sure, rapid, harmless* and *durable*."

WHAT SOME PHARMACISTS ARE FIT FOR.

F. A. BONGARTZ, MEMBER NEW JERSEY BOARD OF PHARMACY.

Since I have had to rate about one hundred and sixty papers of our last and my first State Board examination, and in view of the low standard of same, I think it would be well to enact a law disbaring about 33 1-3 percent of pharmacists from selling anything but shoe strings and postage stamps.

We should raise the standard, then protect the standard and give the public the benefit of the raise.—*N. A. R. D. Journal*.

Papers Presented to Local Branches

THE CULTIVATION OF MEDICINAL PLANTS IN AMERICA.*

HENRY KRAEMER, PH. D., PHILADELPHIA.

The object of this article is to direct attention to the work which is being done in the cultivation of medicinal plants in the United States and the progress that has been made during the past few years in both the scientific and practical development of this phase of pharmacognosy. The aims of pharmacognosy are not only to prove the identity and to determine the quality of drugs, but to study the conditions that make for their uniformity and to ascertain the manner in which this uniformity may be maintained. Under existing conditions our studies must naturally begin with the crude dried drugs of commerce. Indeed, the latter are the official articles and the materials from which both isolated principles as well as the preparations containing them usually are made. Time and time again, however, in our studies of these crude substances our inquiries are directed back to the living plant for the solution of the questions in dispute.

Experience has shown that true scientific progress is only possible when we base our pharmacopoeial and other standard work on material which has been derived from growing plants under direct observation. The more we study the growing plant the more we come to the conclusion that our work, in the first place, should begin here, for at this point we have the answer in most cases to every unsolved query and the verification or check on the conclusions drawn from the facts obtained in the study of the crude materials. So that we may say, given the identification of the plant, the locality of its growth, the date of the collection of the drug, and method of its preparation for commerce, we have the principal factors we require for all basic work. With this information we should know much more about the quality of the drug and what the finished preparation would be than if the drug was collected at random at any time of the year and mixed with old and inferior lots or even good and superior grades. It is not too much to expect that eventually every bale of drug will have a label supplying this information and each lot will be kept separate, and if admixture is attempted this will be left to the judgment of the manufacturer and not to that of dealer or jobber.

The pharmacognocist being somewhat familiar with the origin, formation, distribution, and transportation of various plant principles, and it being well known by actual experiments that the amount and character of these substances is influenced by external factors such as climate and soil and possibly even meteorological conditions, is in a position to indicate at least a possible if not adequate explanation for the discrepancies in analytical work and what should be done to

*Read before the New York Branch, Dec., 1913.

establish a nearly uniform article. Furthermore, he is also familiar, by virtue of histological investigations, with the nature of the tissues and constituents as they occur in the recently dried drug gathered under ideal conditions, and the very great changes incident to the length of time of keeping, varying conditions of storing, etc., whereby interactions and changes among the substances themselves are brought about. Under existing conditions he who works on the finished product is at a very great disadvantage, whether he is the physician who prescribes the articles or the manufacturer who guarantees this product. In other words, there are changes in constituents in the plant due to conditions which affect its physiological activity and also changes in the drug which affect its medicinal constituents. So that the problem of obtaining a reliable drug is a very complex one. It is out of the question to begin our scientific studies with the crude materials of commerce concerning the origin of which and of whose marketing conditions we have no knowledge. It seems to me that there is but one point from which we can proceed with any degree of satisfaction, if we are to have drugs and preparations the guarantee of which may be assured, and that is that we must have the growing plants under competent supervision and scientific control.

When our forests and woods were full of wild plants and drugs they could be easily collected, there was hardly an incentive to consider the farming of medicinal plants. Now that they are becoming scarcer, the need is especially apparent. But our interest in the cultivation of medicinal plants is not primarily because there is a growing scarcity of the sources of supply, but our increased knowledge of crude drugs leads to the conclusion that, if manufacturing pharmacy is to develop to the same degree as the other branches of industry, it requires that rational methods be introduced if we are to attain the goal which the physician must expect of us. Of course, this requires research and investigation and an honest and sincere cooperation on the part of both pharmacists and the medical profession. The work of the physician is distinguished from that of the pharmacist in that he is dealing with a number of variables. His own diagnosis is not always uniform, his patient reacts more or less variously toward different medicines, and no two patients respond alike toward the same medicine. What definiteness can there be in any of his work, therefore, if in addition the preparation is of varying quality and of different strength whenever it is employed? The one constant in the equation must be the uniform quality of the drug, and this we must endeavor to supply as well as the physician should expect of us.

Without considering what is immediately practicable it is a safe rule, I think, to work from what is theoretically an ideal condition. We see that the theory of today is the practice of tomorrow and that upon the ideal of yesterday the success of the future is based. The tendency of the times is for men to become more thorough in their work at least in some special phase. One of the results of this specialization has been research. Investigations have given us a more complete knowledge and as a result of this we are very apt to be conservative regarding the things we know. Anyone who is a sincere student of drugs, and whether in research or in practical life is working out any problems, must come to the conclusion, sooner or later, that we are handling entirely too many drugs to have any very definite information regarding any of them and this does not apply only to the drugs of limited use but to those which have become the main-

stay of physicians. This, for instance, is seen even in such a widely known drug as digitalis, the investigation of which during the past few years has shown that even in the old world the pharmacopoeial standards are based upon nothing but tradition. Fortunately there is a tendency upon the part of some manufacturers, to concentrate their efforts upon a relatively few drugs and study them in relation to the growing plant throughout different periods of the season. These studies are of very great importance as they will enable the manufacturer to secure uniform preparations and it is very doubtful if this uniformity can be obtained under any other conditions. Should these experiments prove to be as successful as we believe they will be it opens up a future of very great possibilities. The effect of this on manufacturing pharmacy would indeed be most vital. It will establish a new era in this work. Instead of there being a few large firms each handling a thousand or more preparations, of which they can not have any very satisfactory knowledge, there will be a thousand manufacturers, depending of course upon initiative and enterprise, each of whom will make preparations of a limited number of drugs to which he gives a reasonable guarantee and the physician will have the satisfaction of knowing the capabilities of any drug which he chooses to employ.

The condition at the present time that prevails in the United States as well as in other countries on this question of bringing medicinal plants under cultivation reminds me very much of the condition in which aerial navigation was some twenty years ago. I happened at that time to be interested in this question and I found that there were several thousand people who were either on paper or practically engaged in experiments on this subject. No one could dream at that time that aviation would be established on a practicable basis as it is. So we find on the subject of the cultivation of medicinal plants that there are many thousand of inquiries regarding the possibilities of this subject, I myself having received not less than two hundred letters during the past four or five years on this question. These inquiries come from both pharmacists and persons who for one reason or another would like to get back to the country and have some definite work to do. Most of these inquiries are very difficult to answer satisfactorily. For instance, a very common inquiry is this: "I have forty acres, partly woodland and partly open country and would like to use it for the growing of medicinal plants. Kindly let me know what plants to grow." Another will say: "I am very much interested in the possibilities of growing medicinal plants. Kindly give me the names of such plants as you think I can profitably grow, and also tell me how to grow them." Others will ask specific questions such as, "Can ipecac be grown in one of our large northern cities?" Others again will write for the names of books on the subject of cultivating medicinal plants. Some few people ask for seeds or plants and seem to feel that you are honored by their requests for supplies. Many of these requests are from persons who have never had any practical experience in growing plants. They may have had some interest in keeping up a garden but their ideas on this subject are that all that is necessary is to give them some particular direction and they will have no trouble to work it out. Nearly all of these inquiries come from persons who know nothing about the commerce of drugs and have no idea of the problems connected with the disposition, drying, curing, and marketing of them. They pos-

sibly have been thrilled by that wonderful story of "The Harvester," or have read the alluring advertisements of "nuggets of gold," in golden seal. Now it happens that as there is no royal road to learning so there is no hewn path which leads to success in the growing of medicinal plants. It is true that some experiments have been conducted and we have some little general information as to how to proceed with the work, but at the best it is in a primitive stage requiring active intelligent pioneers to bring the subject upon a practical basis. It may be pointed out, however, at the outset that no one can grow medicinal plants without having some training and special education in growing plants. Again, unless one knows a good deal about practical conditions in the drug trade, that is in regard to the drug market and prices paid for drugs, even though one does succeed in making a good crop he may not be able to dispose of it. It would seem that a practical pharmacist would succeed best, even though he lacked a practical knowledge of growing plants. For while he may lack a knowledge of agricultural requirements yet by virtue of the fact that there are so many agricultural experiment stations and colleges where this practical information may be obtained, both through correspondence courses and through special practical courses, frequently given during the holiday periods, this deficiency may be made up. On the other hand, the inside information which gradually must amount to intuition regarding the crude drugs of the market can only come after a rather long practical experience. Of course there will be exceptions in this latter case, as the first successful marketing of oil of peppermint in this country was through the common sense of a Mr. Hotchkiss, the keeper of a country store in the village of Phelps, Ontario County, New York.

As has already been stated it is rather difficult to lay down any rule which one can follow invariably on this subject. In fact, very little work has been done to enable us to draw other than very broad conclusions. The first thing that one naturally would consider is locality. We would, of course, not expect to grow tropical plants in a temperate zone, nor mountainous plants at the seaside, although even here there are exceptions and nothing but experiment can reveal them. Then again, there are plants which only grow in the rich soil of the woods, others will grow in the open and on gravelly banks, where the soil is rather barren. In addition there are plants, such as belladonna and cannabis and sativa which grow only on certain kinds of soil, which do not seem to have been successfully cultivated except in a calcareous soil. This may explain why many attempts to cultivate those plants in certain localities in the United States have not been successful.

It is very important in beginning this work in a new locality for one to make a rather careful survey of the plants that are growing wild or have become naturalized. Within certain limits it would be safe to say that if there are a number of genera of any family well represented, and that if the plant which one desires to experiment with has something of the habits of the species represented, there is a probability that it may be grown successfully. Even this can sometimes be ascertained by the nature of the plants that have been brought under cultivation. For instance, digitalis might be grown very successfully in the vicinity of Philadelphia as there are a number of private grounds in which it has become naturalized. By a priori reasoning, if one wished to go into the

cultivation of licorice, the ideal location for growing the plant would be in the west and northwest where the wild licorice, *Glycyrrhiza lepidota*, is indigenous.

It is necessary to study the best ways of propagating the plant one wishes to grow. Sometimes this is by means of seeds, as in the case of belladonna and digitalis; at other times it is by propagation of rhizomes, as hydrastis and glycyrrhiza; or again by rootstocks or prostrate stems as in the mints. Sometimes both seeds and cuttings may be used as in the case of hydrastis.

Plants Grown from Seeds.—Most plants can be grown from seed, and Mitlacher (in Zeitsch. f. a. landw. Versuchswesen in Oesterreich) has given the results obtained with rhubarb, valerian, poppy, matricaria, lavender, hyoscyamus, gentian, pyrethrum, althaea, aconite, etc. When plants are grown from seeds, especially if in a temperate climate where the growing season is rather short, it is necessary to begin the germination of the seed early in the spring. This must be done then in the house or under conditions where there is some protection. These seeds may be sown either in small boxes or in seed pans, i. e. shallow, square flower pots, in which the soil is quite sandy or made up largely of broken granitic rock. The soil must be clean and free from organic matter which is likely to mould. The seeds should not be planted too deep and should be covered with glass so as to condense or hold moisture. Of course where there is the necessary attention as far as keeping the earth moist is concerned, this can be dispensed with. The time required in germination will vary considerably. Many seeds will germinate well within two weeks; usually probably four or five weeks is necessary. Occasionally some seeds, as with roses, may require a year or two before they germinate. The present tendency is to shorten the period of germination in several ways. The simplest, possibly, is to place the seeds in water for 24 hours. When the seed coat is somewhat resistant germination may be hastened by pouring boiling water upon them. Again, some special treatment may be given them as the use of dilute or even concentrated mineral acids. In the cultivation of maté for many years it was found that the seeds would not germinate unless they had previously passed through the alimentary tract of certain birds. Later it was found that the same end could be obtained by placing the seeds for a short time in solutions of hydrochloric acid. F. A. Miller reports that he has obtained good results in the case of belladonna by first placing the seeds for thirty or forty seconds in concentrated sulphuric acid. The germination of seeds may also be hastened by certain mechanical means. This is used when the seed coat is particularly thick and not easily penetrated by the moisture, when if they are large they are filed in one or two places. If they are small they may be shaken with sharp angular sand until the exterior is somewhat roughened.

After the seedlings have a few leaves upon them they are then set out in suitable boxes known as "flats." These are about three inches deep and about two feet square and the soil used should be of a sandy character, containing a certain amount of nutriment. The plants must be watched at this point to see that there is not damping off and loss by reason of the attacks of micro-organisms in the soil.

Should there be a damping off and loss of seedlings then one must study methods for overcoming this. Recently the Department of Agriculture (Carl Hartley, Proc. Society of American Foresters, March, 1912, pp. 96-99.) has

utilized dilute sulphuric acid for this purpose and which I have shown (Proc. American Philosophical Society, April, 1906, pp. 157-163.) is the active principle produced whenever sulphur is used in the greenhouse, and that it is one of the most effective agents for the destruction of insect pests as well as the blights due to fungi and other micro-organisms.

The seedlings are allowed to grow in the "flats," until they have developed a good root system and have three or four leaves. Before placing them directly in the soil out of doors they are acclimated or hardened by placing them in cold frames. This transference should be done not later than the early part of May. The structure and use of the cold frame is perfectly familiar to the practical gardener. Information regarding the construction of this accessory to the garden can be had of any of the seedsmen. In fact, in many instances, they publish small booklets entitled "Vegetables Under Glass," giving information on the tilling of soil during the entire year, and these booklets can be had at a very moderate figure. Sometimes the plants are removed from the flats and placed directly in the soil in cold frames. This may give a temporary setback to the plants as the roots are more or less disturbed by the operation but if one wishes to continue the experiment in the cold frames, later removing the sash, considerable time will be saved.

If the plants are to be transplanted out of doors it is very desirable that this should be done as soon as possible after the last days of the possibility of frost are likely to occur in any given locality. The plants are arranged in rows and set sufficiently far apart so the maximum crop per acre can be obtained. Usually they are so arranged that weeds may be pulled out and the ground worked over.

The above outline may be used for the propagation of most plants by seedlings but they must be carefully cared for if one wishes to get maximum results. Some plants are rather easily grown if care is taken with their culture, as digitalis and belladonna. Other plants, like hyoscyamus, are with some difficulty cultivated, and very few persons, even seedsmen, are uniformly successful in growing aconite. Several good practical papers have been published on the cultivation of digitalis, namely one by Newcomb (American Journal of Pharmacy, Nov., 1911), and another by Borneman (ibid. Dec., 1912.) Some facts regarding the growing of Hydrastis from seed are given in a bulletin of the Bureau of Plant Industry, U. S. Department of Agriculture, by Alice Henkel and G. Fred Klugh. The subject of growing ginseng from seed is also considered in a bulletin of the Division of Botany, U. S. Department of Agriculture, by George V. Nash. At the present time there is considerable interest in the growing of Eucalyptus globulus and other species of Eucalyptus, seeds of which can be obtained from J. M. Thorburn and Company, New York City. A very valuable monograph on "The Eucalyptus cultivated in the United States" was prepared by A. J. McClatchie, and published as Bulletin No. 35 of the Bureau of Forestry, U. S. Department of Agriculture. In addition to these special plants which have been mentioned there are a large number of plants yielding medicinal products which are grown from seeds and require no more care than the usual garden plants. Among these are calendula, Chrysanthemum roseum, Echinacea, and a number of plants grouped under sweet, pot, and medicinal herbs.

Propagation by Cuttings.—This is a common method of propagating plants. A cutting is a severed portion of a stem having one or more nodes or buds. They are derived from over-ground shoots, as in carnation, rose, geranium, and coleus, or, where the plant produces rootstocks or rhizomes, they are made from these rather than from the over-ground shoots. In propagating plants from rhizomes the latter are cut into pieces, each of which has one or two buds, and these pieces are planted. This propagation by means of cuttings or rootstock is extensively carried on in the cultivation of peppermint. A. M. Todd, who has been growing peppermint on a very extensive scale, has given in some detail the method of propagating this plant in an article published in the Proceedings of the A. Ph. A. for 1903, p. 277. A later article on the cultivation of peppermint in the United States is one prepared by Miss Henkel and published as Bulletin No. 90, Bureau of Plant Industry, U. S. Department of Agriculture. Hydrastis is another drug, the plant of which is commanding considerable interest and is being propagated by means of rhizomes. There are three good articles which treat of the practical cultivation of hydrastis, namely, one by John Uri Lloyd in Proceedings of the A. Ph. A., 1905, p. 307¹; another by Alice Henkel and G. Fred Klugh, in Circular No. 6, Bureau of Plant Industry, U. S. Department of Agriculture; and a third by J. C. Baldwin in the American Journal of Pharmacy, April, 1913.

In the case of both ginseng and hydrastis one-year-old plants are frequently supplied by growers, and while taking everything into consideration this is not desirable, yet there may be conditions where, for experimental purposes, they may be used. It should be emphasized that it is not merely a matter of getting rhizomes or young plants but a very careful study should be made of the soil and light conditions which favor the maximum returns from the crop. The use of manure for increasing the yield of both crop as well as constituents should proceed with a good deal of caution until we know more about the subject.

Collecting and Drying of Drugs.—In many of the text-books on Practice of Pharmacy and on Pharmacognosy will be found general statements with regard to the collection and marketing of plant drugs. Some of the large firms also supply collectors general rules that should be followed. In addition, in nearly all of the drug journals will be found, if one goes over the files carefully, a certain amount of information bearing on these questions. When one, however, is farming drug plants, these questions become exceedingly vital for not only do the constituents vary at different times of the season but there is considerable variation in the amount of drug obtained. This information can be obtained only by the collecting of the drug at different times during the season and assaying the material and making preparations from it. For instance, experiments thus far seem to show that belladonna leaves collected in July and August show a higher toxicity than those gathered in September or October. It is quite possible that after the removal of the leaves high in alkaloidal content in July, another crop can be obtained by October. It is important to bear in mind that with some drugs a very slight difference in time of gathering and manner of drying, a great variation of the active constituents may be found, and this applies

¹See also Journ. A. Ph. A., Vol. 1, p. 5.

especially to the composite flowers, as in the case of insect flowers, and *santonica*. It is only when they are in the bud condition that they show the highest amount of active principle. Again, depending upon whether an article is gathered to be put upon the market or whether the active principles are to be isolated as in the manufacture of essential oils, different methods are to be followed, depending upon the nature of the plant and what previous experiments have demonstrated should be advisable. For instance, while in the preparation of oil of peppermint the herb is first dried, yet in other cases the collected material must be previously macerated in order to obtain the largest yield of oil as with those plants yielding volatile oils containing either cyano-benzaldehyde or methyl-salicylate.

Too much attention cannot be given to the entire question of the harvesting of the crop and proper methods of drying, and of course, again, depending upon the locality, different methods will be followed. There are some localities where at certain times it would be quite possible to dry the drugs out of doors. In other situations it would be necessary to dry them in barns and even in specially constructed drying ovens where artificial heat would be employed. Newcomb has constructed a special oven for the drying of *digitalis* leaves (*American Journal of Pharmacy*, May, 1912, p. 207). The drying of leaves, flowers, and seeds is comparatively simple and can usually be rather quickly performed without any special construction. In the case of roots and fleshy fruits the drying should be under special protection and is facilitated more or less by slicing or comminuting the article.

Relative Value of Drugs from Cultivated and Wild Plants.—For some years it has been a question whether the activity of drugs obtained from cultivated plants is equal to that of those derived from wild plants. We find in some of the foreign Pharmacopœias the specific statement that certain drugs as *digitalis*, belladonna leaves, and belladonna root, must be derived from wild plants. This would naturally lead to the inference that wild plants are better and yet it may be that this provision was made with the intention of securing uniformity in drugs rather than because the materials from wild plants are superior. In 1907 Mr. Rippetoe conducted some experiments in Virginia which showed that cultivated plants of belladonna yielded both leaves and roots which were equal if not superior to the average drug on the market. As this work was done without any particular care and in a limited way, it was more than gratifying to those who were especially interested in this subject. These results were published in an article in the *American Journal of Pharmacy* for November, 1907.

Careful comparative experiments on an extensive scale and for a number of years, show, as has been pointed out in a recent paper by Carr (*American Journal of Pharmacy*, December, 1913), that cultivated plants of belladonna contain a little more alkaloid than do the wild plants. "The percentage of alkaloid found in the leaves and stem of dried wild plants was 0.49, while the average of that found in cultivated plants during the eight years from 1906 to 1913 was 0.57. As other investigators have usually recorded about 0.45 in the wild plant it may be assumed that the plant employed was satisfactory. It therefore follows that the effect of cultivation has been beneficial." The investigations of Sievers also point to a similar conclusion. Sievers has also shown that the percent of alkaloids in the leaves of different cultivated plants is exceedingly large, and that plants high

in alkaloids will continue to breed plants high in alkaloids, so that by mere selection a better commercial article may be produced. While Carr states that nitrogenous manures tend to lower the percentage of alkaloids, and Sievers states that it is difficult to determine the influence of soil and climate on the development of alkaloids, Miller reports (*American Journal of Pharmacy*, July, 1913) having grown belladonna plants with commercial acid phosphate and that the yield of alkaloids is as high as 0.9 percent. Miller (*loc. cit.*) has obtained similar results in his comparative experiments with wild and cultivated plants of *Datura stramonium*.

Coming to the question of the cultivation of *digitalis*, we have some very interesting results. Hale, for instance, showed that cultivated *digitalis* leaves yield a much higher potency than those obtained from wild grown plants, and yet he concludes that it is doubtful whether the fact that they were cultivated had anything to do with the high activity. (*Hygienic Laboratory Bulletin* No. 74, p. 28.) One of the most valuable facts brought out in connection with his investigations is that the leaves of one-year-old plants seem to have as great toxicity as those of the two-year-old plants. Hale distinctly states later (*Proceedings A. Ph. A.*, 1910, p. 928), that "first-year leaves are not necessarily weaker than second-year leaves and might be used in preparing assayed *digitalis* preparations." This means that one does not have to wait for two years before securing a crop, and that practically he can obtain twice the quantity during the same period. Although there are published records of experiments which show that when aconite is cultivated it contains less alkaloids, yet Schweizinger (*Pharm. Ztg.*, 1891, p. 608) has demonstrated that cultivated plants are equally and even more toxic than wild plants.

There may be some instances during this experimental stage which might seem to indicate that certain external conditions, such as climate as well as soil, have a very great influence in the growing of plants of exceptional value. For example, in the case of American-grown cannabis, Eckler and Miller have shown that repeated plantings from carefully selected plants of American and Indian cannabis have failed to yield, when in cultivation near Indianapolis, a product testing over 65 percent of the active value of good Indian-grown drug and that the majority of the plants tested 50 percent and even less. Experiments conducted in Somerville, N. C., by the U. S. Department of Agriculture have shown that in that locality a drug of a somewhat higher degree of potency can be grown, although not quite equal to the plant grown in India. Of course it is well known that the hemp plant is grown extensively for fiber in Kentucky and other parts of the middle West. This may be due in large part to the fact that it requires a limestone soil and in practice the most favorable results are obtained where there is an underlying bed of blue limestone. (*Yearbook*, U. S. Department of Agriculture, 1895.) Sufficient has been said to show that success will attend the cultivation of medicinal plants, and indeed by a priori reasoning on the basis of other agricultural efforts we would expect that medicinal plants could be grown with the same certainty of increasing the yields of any particular constituent or quality that might be desired. Indeed, the history of the sugar beet industry has been duplicated in the work on cinchona, and the same thing can be said with regard to any other plant that man desires to conserve and cultivate.

It will require some years before we can say anything definite about the conditions necessary for the successful cultivation of the many plants that have scarcely been known outside of their native haunts. There are no insurmountable obstacles in this work and there are no intricate processes to be solved before success results. There are merely a few underlying principles that must be adhered to and by persistent effort and with a full understanding of market conditions, success must crown the efforts of any one who undertakes this work. What has been done in the selection of fruits and vegetables can be equally well accomplished with drugs with the proper incentive.

Some Steps of Progress in the United States.—We can scarcely appreciate that while the development of medicinal plant culture has been an exceedingly slow one, yet as a matter of fact, by reason of some of the products being more extensively used in other industries as in the case of hops, it is one of the oldest agricultural industries in the United States. The history of the cultivation of hops is very similar to the experiences recorded with other medicinal plants. For instance, hops were grown in Virginia and in Vermont and Massachusetts. In the former the quality was poor and in the latter the results were very successful. By virtue of the success obtained in the New England states it was in the early part of the last century introduced into New York State and later spread into some of the middle states as Michigan, Wisconsin, Indiana, and Ohio. Since that time the cultivation has been extended to some of the states on the Pacific coast, notably in Oregon, Washington, and northern California.

In the cultivation of peppermint we find a similar history. The industry was first developed in Wayne county, New York. Later it spread into Michigan, Ohio, and some of the southern states and by reason of the more favorable climate and soil conditions in Michigan the industry here has outstripped that of even New York State, being practically abandoned in Ohio and the other states.

The men connected with the Division of Botany of the U. S. Department of Agriculture have always manifested a keen interest in the possibilities of the cultivation of medicinal plants and have done what they could to encourage interest in this subject and the records show that they have supplied information as it might be needed by those disposed to take up the work in a practical manner. The development of the tea industry in North Carolina is one of the most creditable pieces of work of the National Government. Bulletin No. 234 of the Bureau of Plant Industry, on the "Cultivation and Manufacture of Tea in the United States," by George F. Mitchell, should serve as an inspiration to any one contemplating drug culture. If a plant of this kind can be grown successfully here and the technique of manufacture developed to such an extent that the cultivation at Pinchurst, North Carolina, has become remunerative, there is no reason but that within reasonable limits nearly every plant except the strictly tropical ones can be successfully grown in the United States.

Without doubt, the camphor industry will become successful in some of the southern states. Nearly fifty years ago when the price of camphor was very high, the government started some experiments in Florida in the growing of camphor. These experiments were subsequently abandoned as there was hardly any likelihood of any one being interested in this commercially, on account of the low price of camphor. During the past few years, however, interest in this

culture has been revived in Florida and southern Georgia by reason of the fact that frosts destroyed the citrus fruits and the land owners began a search for other possible crops which would not be so injured. Circular No. 12, Division of Botany, U. S. Department of Agriculture, shows just what can be done for the successful cultivation of this tree in the southern states, and some recent experiments of the Government show that by utilization of leaves and twigs there are great possibilities in the economical manufacture of camphor in the United States in spite of the high price of labor.

Owing to the fact that essential oils are used in such large quantities it is quite likely that the cultivation of many of these plants may be made successful, providing at the same time that suitable apparatus for their distillation is also installed upon the farms. The article in the Yearbook of the U. S. Department of Agriculture for 1898, by E. S. Steel, on "Can Perfumery Farming Succeed in the United States?" is deserving of careful perusal by those contemplating taking up any serious work in drug culture.

By reason of the fact that the cultivation of chicory is a permanent agricultural industry in nearly all of the countries having a temperate climate in Europe, experiments have been conducted in the United States in a small way and these have led to the conclusion that it may be successfully cultivated in those states where the sugar beet industry has flourished. The results of this work in the United States were published in Bulletin No. 19, Division of Botany, U. S. Department of Agriculture, entitled "Chicory Growing as an Addition to the Resources of the American Farmer," by Maurice G. Kains. I have elsewhere enumerated the plants which may be successfully cultivated and have indicated in a general way how either plants or seeds may be obtained. (Kræmer's Text-book of Botany and Pharmacognosy, pp. 403-416.)

Summary.—The following is a summary of the principal points which I have attempted to bring out in this article:

1. That there has been very great progress made in the practical cultivation of medicinal plants in the United States during the past five years.

2. That our interest in the subject should not be merely by reason of scarcity of drug supplies, but for a more important reason, viz., that uniform products may be produced.

3. That this uniformity in crude drugs and their products is a principle that should be practically attainable and is fundamental in the development of modern pharmacognosy, pharmacology and therapeutics.

4. That the experiments in the cultivation of medicinal plants which have been conducted in the United States have given us certain information that can be generalized and applied to plants other than those already experimented with.

5. That the following points might be held in mind by those who desire to take up the cultivation of medicinal plants.

In the first place he ought to determine whether there is a market for any drug under consideration, and this can only be obtained by personal inquiry and investigation, as not even any of the government publications show this.

In the next place, if one is satisfied that it is worth while to take up the cultivation of any particular plant, then its geographical range should be studied, both as to where it is indigenous and where it has become naturalized.

The literature should be gone over not only for facts regarding the cultivation and distribution of the particular plant in view but also of some of the related plants.

At the same time that these preliminary studies are made, a careful survey should be taken of the plants which are indigenous and in cultivation in the particular locality where one is proposing to locate the farm.

Then, of course, everything should be done on a small scale at first. If there is no information available then he must, on the basis of the general principles laid down for the cultivation of medicinal plants, proceed with their culture, conducting parallel experiments with propagation by both seeds and cuttings.

When the crop is harvested he must by analytical and other means satisfy himself as to the value of his product compared with the commercial article, and with these facts in hand submit specimens and request quotations from the dealer in crude drugs and from the wholesale druggist. On this basis he will arrange for all future crops with some certainty as to their market value. Experience has shown that cultivated crops command a higher price than the drugs obtained from wild plants even though their superiority cannot always be demonstrated by analytical means. For instance, no one is trying to determine by an analytical process whether any given lot of tobacco, tea, or coffee is of superior value, and yet the competent dealer and the discriminating public even recognize the qualities of the grades that are offered. This is even more marked with the products that have been derived thus far from cultivated medicinal plants and are appreciated by some pharmacists and physicians.

WINDOW DRESSING.*

IRA B. CLARK.

It would seem, in looking at the drug store windows of our fair city, that most of them could not be used for any other purpose than the admission of light and as a repository for various kinds of drug store junk that could not find a resting place in any other part of the store. In some of them, we see nothing but accumulated dust and flies, with a few sunburned packages of some patent medicine, or a set-up display of one of the numerous products of the tobacco trust, which is allowed to remain in the window week after week, and in still others, nothing at all.

To the majority of druggists, dressing a window is a big bugaboo with long horns and you frequently hear such expressions as this: "I know nothing about dressing a window" or, "It takes an artist to make a good window display," or "It takes too much time." Now I insist that no special artistic ability is required to arrange a window display that will pull trade right into your store. What is needed, however, is sufficient energy to do the work, a little application of gray matter, and judgment in the selection of seasonable and profitable articles of merchandise. The time required to do the work will be well and profitably spent.

*Read before the Nashville Branch, Dec. 11, 1913.

In order to dress a trade pulling window, it is necessary of course, to select a seasonable article. Cough remedies do not sell well in July, neither will a perspiration killer have much sale in zero weather. No matter how much publicity may be given these worthy preparations, they will not sell out of season. As previously stated, the application of some thought is necessary in arranging a window and it is essential to begin planning your window a week or longer, beforehand, in order to get all the details worked out, and when the times comes for placing the display it will be found to be comparatively easy work.

In beginning your display, cover the floor of the window with some material, crepe paper is generally very acceptable, that will either harmonize in color or be in sharp contrast with the general color of the article to be displayed; that is, do not use a combination of red and yellow, or brown and blue and so on. Colors that will produce a harmonious blending are red and green, or blue and white, or orange and black, etc. Begin at the front of the window with arrangement of display and elevate toward the back. The elevation being dependent on the depth and length of window. Be careful not to leave any wide openings or breaks in the display, to convey the impression that something had been taken out or had been omitted.

In order to make a pleasing display of merchandise, it is necessary to have the arrangement well balanced; that is, do not have one side high and the other low. If you build a pyramid on one side of the window, be certain to make a counterpart on the other side.

It is not always necessary to have a large stock of goods to make a creditable display. A very attractive window may be made by covering a number of small boxes with the same material that is used in covering the window floor and arranging them in steps, pyramids or otherwise, and placing on them the articles to be displayed, and a very harmonious effect is produced. I have seen a very attractive window with only a twelfth of a dozen of the exploited article in the display. This and a price card, with a small amount of text matter, constituted the trim.

While a large stock is not necessary for window display, it is often desirable to make as much on display as possible, in order to impress the buying public that you sell the article in no small quantities. For the past several years, the writer has been putting up a chapped hands lotion, which has been exploited to the public through the medium of package inserts and window displays. Recently, during the present season, a display of two gross was placed in the window and during the week we had a sale of forty-eight bottles of the preparation. While this article has some general sale in a general way, over my own counter, the demand is always stimulated by a window display and one of the windows is given over to this article about every four weeks during the season.

A window may be well arranged and prove attractive, but from a merchandising standpoint it is incomplete without a price card or cards; without the price being made known, the story is only half told. Your display may impel the prospective purchaser up to the buying point, but he or she, not knowing the price will come to a dead stand still and the sale is lost. The importance and value of a price card in connection with a window display was impressed on the mind of the writer several years ago and before rubber goods had advanced to the

present high prices, when we had a window, consisting of one dozen fountain syringes and a card with this legend, "\$1.00, Guaranteed for one year." A lady, who was not a regular customer of the store and lived eleven blocks away, ordered, by phone, one of the syringes we had in the window, saying she had seen it in passing on the street car.

The value of the drug store window as an advertising medium should be so self evident that no argument is needed, but as remarked at the outset, this valuable asset is not made use of by the majority of druggists as it should be. There is no drug store so small, or its location so isolated, but what would be benefited by a systematic use of the windows for displaying merchandise. Prospective buyers of your wares are constantly passing your store in greater or smaller numbers and any one of this number may be made a permanent customer by an appeal through a window display. It is a generally conceded fact, that, getting the customer across the door sill is half the battle. If your store service is of the proper kind and stock well kept, you can then call this customer your own.

It is important, and I may say necessary, that window advertising, to be effective, must be changed regularly and frequently the same as any other form of publicity. Again I hear the pharmacist say, "That will take too much time and be a great deal of trouble." But this is not true, after the start is once made. Have a stated time for changing the windows and do not let any thing interfere with this arrangement, except sickness or death. A display should not remain in the window a great length of time, I would say, not longer than a week, as after that time it begins to grow stale and loses its power to draw trade. I repeat, the windows must be changed regularly and frequently, and if a specified time is set aside for this work, it will prove a pleasure and be as easy of accomplishment as any other store routine.

What is the best class of merchandise to display in the windows must be determined by conditions and the location of the store. The present day drug store carries such a variety of stock that no difficulty should be experienced in selecting something every week for a window display. Frequent changes could be made from a list something like this: Toilet goods of a general character, a combination of tooth brushes, powder and paste, own make preparations. Olive oil has recently become a staple drug store seller, make an occasional display of this; stationery is a profitable side line and an effective window may be made with box paper. Rubber goods, such as hot water bags and fountain syringes can be arranged in an attractive manner and is sure to bring dollars into the cash register; cotton, gauzes, bandages and surgical dressings could be used frequently and with good returns. A window that invariably excites interest and comment is made with old prescription files, and utensils used in prescription work; a percolator in operation adds interest to the display.

It is rarely ever good policy to make a display of patent medicines as they are unprofitable and may be bought at any drug store and at some places that are not drug stores. If you must display patent medicines, make the proprietor pay you for the space and make him pay you well for it.

Never use in your window but one kind of goods or goods of an allied character as a conglomerate of stuff stacked in the window will not make a very deep impression on the minds of the passers by.

We are frequently urged by the proprietors of nationally advertised goods to "connect up" with their advertising and reap the benefits from their publicity campaign. The advertising man is a wily individual and knows the value of your windows, but it is not good policy to use your window space for the exploitation of merchandise that does not pay a good profit and may be procured any place. However, this matter should be treated with some discretion. The store with a considerable transient trade, may with advantage, give valuable space to "nationally advertised" goods, but the neighborhood store had better stick to the profit makers. Persistent publicity in his small world will be to the advantage of the retailer in the same ratio that it is to the big fellow in a wider field.

A word again on the regularity of changes of display. By frequent and regular changes in the window, the public will learn to look for something new in your window and will respond liberally, in the exchange of their dollars for your wares. The effect of publicity through the show window is, in most instances, immediate. The desire of the buying public is aroused to the purchasing point by an attractive window and it is then a simple matter to step in the store and complete the trade. Then too, the effect of window advertising is cumulative. It has been the frequent experience of the writer to have demand for some article the customer describing it, by saying they had "seen it in the window week before last."

In conclusion, I would advise every druggist to form the window display habit. It is both interesting and profitable, and don't forget the price card with a brief descriptive text.

PHARMACEUTICAL ADVERTISING.*

JEROME A. WILKERSON, ST. LOUIS.

What a vast subject and how little appreciated by my colleagues in the profession! I have talked to quite a few pharmacists on this subject, with the same expressions—that I was crazy, it was a losing game, it didn't pay, or it was unethical.

Just as we would be seriously handicapped by resorting to the sail boat in the days of high powered steam vessels, so too is the merchant who prefers sail-boat methods seriously handicapped in his business voyage on the high sea of commerce.

I shall endeavor to convince you as best I can in the limited time, the essential value of advertising, not advertising in general but in particular; advertising in the pharmaceutical world, and will start by taking the more common pessimistic remarks against it.

The most common is, "It doesn't pay." Right here I want to emphatically state that it does pay. But that the results cannot always be determined directly be-

*Read before the Saint Louis Branch, November 22, 1913.

cause the indirect returns are speculative and sometimes more effective than the direct ones. Let me illustrate.

Suppose you sell a certain cough syrup that the manufactureres advertise extensively and for which you pay from both ends of the game; 1st, because you pay a long price 2-4 and 8 for the article, which is made so cheaply that regardless of their heavy expenses, the manufacturers make thousands of dollars on it each year; 2nd, being a popular article, it is most likely to be sold at a cut price. Some one will try to convey the impression he sells for less than you, and consequently you rebate the customer off the prescribed price.

Now if you will manufacture and advertise your own preparation and charge the cost of advertising upon the cost of production, your own article will still cost you less and sell for more, as you can govern the price. The impression conveyed that you are capable of formulating medicines, will indirectly sell your hair tonics, cold creams and other goods of your own manufacture. The trouble is that the average druggist thinks that if he advertises he must follow out the expensive way employed by the larger manufacturer, which is entirely wrong. A cough syrup of your own make need not be advertised on bill boards or newspapers. A more effective way for you will be to use counter inserts, stickers, rubber stamp, or program advertising. You will be surprised at the results.

To illustrate this. During a certain month last year we sold a gross increase of cough syrup which cost us to manufacture 94 cents a dozen or \$11.28 per gross, plus \$2.00 for counter inserts (which we know were the direct cause of the increased sales, and we never will be able to estimate the indirect results), making a total cost of \$13.28 a gross, which retailed for \$36.00 leaving a profit of \$22.72. The possible sale of an advertised brand which would have cost \$24.00 less 5 percent or \$22.80 net and retailed for \$33.12 at 23 cents per bottle, would leave a gross profit of \$10.32. The difference between the two being \$12.40 or over 100 percent better profit for your own product. It is profit and not sales that count.

Well, I think I have showed you how it paid in one particular way and here is another.

Granting, which is most essential, that your preparation has virtue, it is bound to create friends, who will recommend others to your store and who will send miles to get it if they move from your neighborhood; and once you have them as a friend you enjoy the advantage of restricted sale and the profit on their possible other purchases.

You might state here, that you are not convinced of any advantage, because if you had sold the same preparation over the counter by recommendation, the result would be the same. True, but you cannot reach everybody who wants a cough syrup at the particular time he needs it; he might live next door to your competitor and yet be reminded by your advertisement that you have a special cough remedy and go blocks to give it a trial.

The next common argument, is that it is unethical. It is not any more unethical to advertise and to sell your own article than it is to sell an article nationally advertised. The only point of ethics is to know what and how to advertise. Advertise and push articles that do not conflict with any physician's practice. Advertise your cough syrup, cold creams, lotions, hair tonics, liniments.

tooth preparations, plasters, bird seed, corn remedies, toothache drops and cathartics.—Do not advertise that which might conflict with the practice of a physician or that which will encourage “self medication,” which is oftentimes dangerous, as for instance, kidney and stomach remedies, nervines, female tonics, and many others with equally disastrous effects.

With these suggestions as to “What to advertise,” let me show you “How” and to “whom to advertise.”

It is necessary in order to become a successful advertiser, to not only advertise a preparation or a line of preparations to the buying public, but you should at the same time popularize your store, calling attention to some special way you have of doing things or of your efficiency and accuracy.

You might cater to the prescription end and state your advantages, such as the fact that you are a graduate of a recognized college of pharmacy, a member of various pharmaceutical associations, and that you have a well earned standing among your physicians for honesty and efficiency; that your prices are as low as any—quality considered. You might also advertise your soda fountain specials, your cigar department, your line of toilet goods and kodaks.

It seems a pity that so many druggists neglect the advantages offered in advertising to control their own territories. When a man opens up a big down-town kodak store, his overhead and advertising expenses are enormous, yet he meets these and still makes a profit. He draws your customers and those of other localities to constitute a volume of business. He popularizes his store. He has no inducements to offer better than yours. Yet he invariably succeeds without the valuable asset of personality.

People living in your locality, would rather buy of you where they are known and free to ask questions. There is nothing nicer than to trade where they are known, provided you win their confidence, have a fresh stock, low prices and the ability to supply them.

I often have been told that, all things being equal, they would rather purchase this class of goods from us, where they are known and have some recourse in event anything goes wrong, than to buy at a strange place. Hence the most valuable asset a local druggist has is his personality.

Do not lose sight of the fact that you have a professional end which can be helped by advertising. Besides reminding the public of your prescription department, cultivate the good will of your physicians and nurses by supplying them with goods at a discount, whether the physician be a prescriber or dispenser. Don't ever discriminate. If the doctor is a prescriber he might enjoy a closer friendship than the dispenser, which has some advantages. If he be a dispenser, cultivate his good will and business and make a booster for your store which will bring indirect results. By cultivating his business you can make a small profit on biologics, cottons, etc., on a wholesale basis, which will increase your buying capacity and help you to enjoy the discounts from the manufacturer. Effective ways of advertising to your physician I shall treat of a little later on.

The various methods of advertising any particular article or item will best suggest themselves after you have studied the requirements of your immediate neighborhood.

Counter inserts give the best results on the advertising of any particular article, going right into the hands of the customer. A catchy short explanation of the article, its uses, etc., set up with a prominent display of the name of the article and the price, is all that is necessary. Do not go into details in an advertisement, because it will not be read and very likely on account of the congested appearance of the type, will not be glanced at a second time, but thrown away.

Another valuable method, which most druggists look on with scorn is program advertising. If carefully handled it is bound to prove effective. The reason some druggists never get results from this form of advertising is their own fault. To fill in a space on a program with the words "John Doe—Druggist, Prescriptions a Specialty," is just wasting money, unless you want those interested in the program to know that you have donated, and "Let me alone." It would be just as well to have inserted "This space paid for," for all the effect it has.

The way to get all that is coming from this class of advertising is to advertise one particular article and make it strong. This is especially advantageous in the holiday season. If you plug away on one particular item you are bound to get either direct or indirect results.

To test the effectiveness of program advertising, I ran a 10 cent rebate coupon on a 25 cent box of face powder that cost \$1 a dozen with the results of a sale of 65 boxes @ 15 cents each cash, or \$9.75. Deducting \$5.50 the cost of the powder and \$2.00 the cost of advertisement, I made a net profit of \$2.25 on the powder and an indirect result of an increase of business on other articles.

The rubber stamp and the sticker have little if any value. They have always appealed to me as a half-hearted attempt at advertising unless applied on a 'limited time special.'

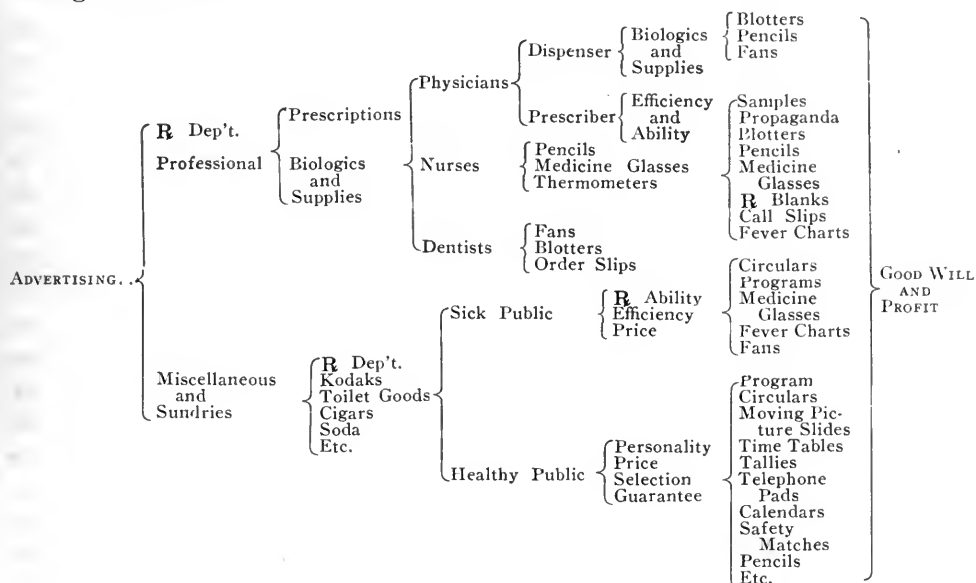

Circular advertising is very effective but a little more expensive than other advertising. It is to the local druggist what the newspaper is to a downtown man, and should never be overlooked if you are in the game. Euchre and bridge tallies having printed on them your advertisement of a special cream or cosmetic and given to private or public euchres are good advertising; also telephone pads, calendars, safety matches and owl car time tables.

The foregoing are all used to advertise to the public. Your physician and your dentist must not be overlooked if you desire to increase your professional end. This is easily accomplished by supplying them with pencils with your business advertisement on them.

Blotters may be given from time to time suggesting the use of U. S. P. and N. F. preparations, with their formulas and therapeutic value printed on one side, which is in itself propaganda work. You might also supply your physicians with prescription blanks, fever charts, and medicine glasses, and the dentists with tooth paste, order slips and palm leaf fans with your imprint thereon for their offices in warm weather.

You can hardly appreciate how this helps. Even though a physician sends you some of his prescriptions, these "live wire" advances will arouse him from a neutral state and make him an enthusiastic booster for your store, so much so, that he will insist that his prescriptions be filled by you.

This chart gives you an outline of what to advertise, to whom to advertise, and through what channel.

In conclusion I would say that these things take time and nursing. You must not look for large returns immediately, but if patiently followed out the remuneration will be worth your while. The longer you follow up advertising the less you will seem to know about it, because things and methods change so rapidly with the introduction of newer and novel ideas. But the game is fascinating and the longer you work the more you will like the work. It may appear deep and intricate at first, but it really is very simple. Master the fundamental rules and you will be as proficient as anybody. My advice is to start now.

"CONSERVATION IN RELATION TO PHARMACEUTICAL CHEMISTRY."*

H. C. FULLER, THE INSTITUTE OF INDUSTRIAL RESEARCH, WASHINGTON, D. C.

The conservation question has been before the public to such a large extent during the past few years that in some ways I hesitate to make any remarks on what might be considered a hackneyed subject; but it has an important relation to our particular branch of science, and economic conditions at the present time certainly demand conservation in this field, so it seems important enough to give the subject some slight consideration.

It would not be possible in a few paragraphs to consider the application of this subject to all of the different branches of pharmaceutical chemistry, and I am only going to touch on four of the important points which have come to my

*Read before the Washington Branch, December 17, 1913.

special attention during the past few years, and especially during the two years that I have been connected with the economic side of the work.

The four points that I want to talk about are those relating, first, to the manufacturer; second, to the retail druggist; third, to official control; and fourth, to fakes.

A sort time ago there was placed on my desk a package of considerable bulk which, on opening, I found to consist of 142 monographs, mostly reprints of magazine articles but all the work of a number of scientists connected with one particular laboratory and all relating to pharmaceutical chemistry in its highest scientific sense. They were all articles on research problems, and in most cases went to the very root of the question under consideration. The laboratory which was responsible for this work is under the protection of the British Empire, and the firm itself is a manufacturing house which has had wonderful success in its business and is now invading the American market to a degree which is appalling. This mass of research matter gave me considerable food for reflection, and I sat down and looked over the indices of some of the abstract journals to see what we in America had contributed, in a scientific way, to pharmaceutical chemistry during the same period. While in the whole we have done a good deal, with the exception of the work done by our own Bureau of Chemistry here in Washington and by the American Medical Association in Chicago, very little of what might be called real scientific research has been done by the profession at large. We all know that some of the larger manufacturing houses do maintain laboratories which, they claim, are devoted to experimental work and, supposedly, to advance research. In one case I know that such a laboratory has been run for at least a decade and that the picture of the building is used for advertising purposes. However, the amount of real valuable work that has been turned out by this laboratory, at least so far as has been made available to the science at large, would occupy but a few inches of index space during all that period.

It is not my purpose to intimate that the entire success of this foreign firm is due to research, but it is very evident from a study of their products and from the fact that their value has been positively ascertained, both by practical and chemical investigation, that at least part of their success is due to their ability to get at the bottom of things. The American manufacturer has certainly wasted a great deal of time and energy in making up products whose chemical and therapeutic value were uncertain, and in many instances absolutely unknown, and has relied on the medical profession to get results from which he could make advertising. We have this forcibly brought to our attention by the vast number of digestive products that have been exploited and which, on investigation, are found to be either inert or of so little therapeutic value as to be unworthy of consideration by the medical profession or by the laity, who actually consume them. We have seen how manufacturers would put out preparations claiming to possess the virtues of cod liver oil and extol the value of the alkaloids present in the original material, when, as a matter of fact, we know that the true value of cod liver oil has nothing to do with the alkaloids; and these substances are indicative of putrefaction in the livers before expression and are really a sign of impurity. They are ordinary, common amines which can be made from any liver—dog, cat, or most any refuse from the slaughter houses. We see hundreds

of preparations on the market, with fancy names, which are made up of products containing so-called resinous principles with unknown glucosides which, if investigated—as was done by the firm above mentioned—would be shown to consist of nothing extraordinary and probably nothing of any value. It can safely be stated that as soon as the manufacturers fully wake up to the idea of careful research, it will be possible to write a very interesting mythology in pharmaceutical chemistry and to relegate hundreds of products of supposed value, to the waste heap, and it will be possible for these same manufacturers to save their shelves and the shelves of the retail druggist from an immense accumulation of worthless material.

The point I wish to make is that the manufacturers could well determine the actual value of their products from a chemical and an unbiased therapeutic standpoint before they put them on the market, thereby saving themselves great expense in maintaining a supply of useless crude material, in making up valueless pharmaceutical products and overlooking space which might be used to good advantage with meritorious articles.

Some of our manufacturers, especially those who have not been in a position to retain on their staff a fully qualified pharmaceutical chemist, are taking steps to have their manufacturing processes examined, criticised and improvements suggested; and what is of special merit, also are learning how to analyze their products so that when they claim on the label that it contains a definite quantity of a certain ingredient, regardless or not as to whether it is an inhibited drug, the amount that they claim on the label will actually be found there. It is well known that methods of assaying complex mixtures are very few and many of them can be worked out only after a considerable amount of experimentation, but with time and thought there are probably only a few such problems which could not be solved. A full realization of this question would have saved hundreds of manufacturers from prosecution under state and national and local drug laws, and at the same time have saved them untold expense.

The American Medical Association, though it has been greatly criticised by some of the manufacturers, has done an immense amount of very meritorious work, and it is to be hoped that in their laboratory, in Chicago, they will continue to carry out their present policy. The American manufacturer or associations of manufacturers could do nothing more to their advantage than to thoroughly cooperate with the work that is being done in the laboratory of the American Medical Association; not necessarily to adopt their suggestions, but to check up their work and to adopt it where it is shown that the American Medical Association is right in their conclusions as to the value of a particular preparation and to show wherein they may be wrong in case the manufacturers' laboratory obtains different results. By this means, progress looking to the final evolution of meritorious and perfect-keeping products, would be much more rapid.

Coming to the retail druggist, there are two points which I think ought to be emphasized in the beginning and which, I believe, will be agreed to by all of us present. In the first place, the retail druggist is not primarily a storekeeper or simply a vendor of supplies. His place in the world of pharmacy can be obtained only by a scientific study, and he is not allowed to enter into his profession until he has passed certain examinations and fulfilled certain requirements satisfactory

to the community wherein he desires to establish himself. This should make him vitally interested in what he sells, both as regards the efficiency of the same as a medicine and as to its keeping qualities and activity as a drug. Also, on account of the vast amount of legislation which is going on at the present time, he is obliged to keep up, to a greater or less extent, in analytical chemistry.

The retail druggist is obliged to stock his shelves with a great variety of substances, preparations and mixtures, and in some stores this supply will probably reach into the thousands. These things come to him from manufacturing pharmacists, patent medicine makers, manufacturing chemists pure and simple, and those who deal in specialties—to say nothing of the numerous preparations which are not strictly drugs or medicines. Oftentimes the druggist has to invest a relatively large outlay in some one thing for which he has but few calls, and sometimes these calls only come at the interval when a manufacturer is carrying on a detail in that vicinity. He also is obliged to stock his shelves with a vast amount of material which is absolutely useless; some of the things being of high cost. At the present time there is a great run on peroxide creams, antiseptic soaps, throat lozenges claiming to have active formaldehyde, and others. A great majority of these things are absolutely useless. There is no peroxide cream made which contains any detectable peroxide; and the value of antiseptic soaps is mostly in the label and not in the body of the substance in question. However, the druggist is obliged to carry all these articles and many others of analogous properties, and hence he becomes merely a storekeeper.

It seems as if the American Pharmaceutical Association could do the trade a great deal of good by establishing a central laboratory, where products could be carefully checked up, and, where they are of no value or of doubtful value, a full exposure could be made and sent to all the members of the Association so that they need not stock their shelves with these useless articles. Furthermore, this laboratory would be in a position to advise its members as to the true relative merits of the lines carried by the different manufacturers, and thereby enable the druggist to talk intelligently to the physicians who are his patrons, as well as to the lay patron. Again, such an institution would have an opportunity to work out methods of analysis which are of special importance to the retail druggist—simple methods, if possible, whereby he could quickly check up some of the things he makes, such as tincture of iodine, spirit of camphor, paregoric, etc.—all of which must contain a definite quantity of the active ingredient and which, if wrong, are likely to subject him to unpleasant prosecution and notoriety.

The retail druggists ought to spend some time in studying the question of cost, and, wherever possible, suggest to manufacturers the conservation of raw materials in order that the substances which they use to a considerable extent can be obtained at a better price. For instance, probably not one retail druggist in a thousand knows that the chocolate manufacturers in this country have for years thrown away by-products which contain valuable ingredients amounting to from fifty to one hundred and fifty dollars a ton; ingredients which are used to a great extent by the members of this profession and which would probably have a larger use if they could be obtained at a more reasonable figure.

Again, the woolen manufacturers have for years thrown into the rivers, or sold something little better than sludge for leather makers, a grease which can be

worked up into the finest grades of lanolin, equalling and surpassing in quality that which is imported from Europe. A laboratory such as I have mentioned above would be in a position to take up such questions and impress upon the manufacturer the advisability of working up these goods for the American market.

There are many other points which such an institution could do to assist the retailer and which would undoubtedly make the Association a much stronger body than it is at present, by bringing in a larger membership. But I have not time at the present moment to go into all the features.

Coming now to conservation in connection with official control, I want to say a few words regarding the matter of rules, regulations and laws which are being enacted and which affect our particular work.

The Food & Drugs Act has proven to be one of the most interesting and valuable pieces of legislation that has been enacted in this country for a long time, and it is being copied to a large extent by the different states. As a whole, it has worked quite well; and certain features which have allowed technical violations, have been corrected or an attempt is being made to correct them. Before advocating new legislation or radically modifying this law or any other, those who have the matter in charge ought to be absolutely certain that the results sought can be obtained and are really going to be of benefit. I say this because, as it is now, the people who are engaged in the selling of pharmaceutical products come in contact with national, state and local laws; and a study of the requirements in vogue at any particular time is quite a problem, in order that goods may be honestly labeled, and the uncertainties of new legislation and the consequent changing of labeling, if anything new is enacted, requires constant alertness at great additional expense. Now, it is well known that the final burden of all these added expenses comes on the ultimate consumer, and the vast amount of legislation that has been enacted and enforced during recent years has been a great factor in the increased cost of living, both in relation to foods and medicines. I think it can be said truthfully that if the Federal Food & Drugs Act were strictly interpreted and enforced in the District of Columbia, it would drive every small retailer out of business within five years. This may seem a radical statement, but, with his multifarious stock he cannot keep it always up to standard, and if rigidly inspected it would not be long before he would be caught twice for the same offense which, as we know, carries a jail sentence, and even though the man may have been perfectly honest in his desire to keep his products up to standard, we know what the experience has been in the past. The courts pay very little attention to this in many cases. It seems as if control officials should endeavor to help instead of to persecute the retailer. Those who are doing an underhand business will soon be discovered and the energy of enforcement can be visited on them and the honest dealer made to feel that he can conduct his business without constant fear of prosecution.

Going back to the Food and Drugs Act, a short time ago an attempt was made to enact an amendment requiring the declaration of about every individual drug in the Pharmacopœia. There may have been some reasons for this, but before such legislation is enacted or attempted, its real necessity ought to be ascertained. It would appear to me from a study of this particular feature of drug legislation, that we require the declaration of too many drugs now. The primary object of

this declaration is to let people know what they are getting and to let them know if they are buying an habit-producing drug. Every one knows about opium, cocaine, and chloroform; and a large majority probably know something about acetanilide, but probably not one in one thousand ever heard of eucaine, and alpha eucain is not sold in the United States. Probably not one laymen in five thousand every heard of cannabis indica, and it is doubtful if the Hashish habit will ever be in vogue in this country. However, if there is danger of such a contingency, to be consistent we should make provision for the chewing of areca nuts and the eating of mescale buttons. Furthermore, cannabis indica cannot be determined, and the declaration of it is of small value because the amount stated cannot be checked. Alcohol in medicine is not taken for its medicinal effect. If one wanted alcohol for this purpose he would buy whiskey, or some of the straight grain alcohol. "Medicated boozes" can no longer be sold except under a revenue license, which brings them into the same class as whiskey, and under the category of beverages on which no declaration is necessary. Personally, I cannot see the logic or the necessity requiring a declaration of alcohol, and such declaration requires a vast waste of time, energy and material all over the country in assaying the batches of products containing it. Hence, the burden of declaring a lot of other things on labels, the checking up of the analysis and other useless procedures connected therewith, ought not to be imposed on the members of our profession.

At the last meeting I listened to a discussion regarding the declaration of sales of coca and cocaine, required by the Treasury Department. It was apparent that the most of the members present thought that such a declaration carried the goods down to the ultimate consumer, or practically to that end. I think, myself, that the matter was taken too seriously and that it will not be taken seriously by the trade as a whole, for, to check up such a proceeding would require nearly as much work as checking up the returns under the income tax; and as there is no appropriation for carrying it out and no penalty attached for not complying with it, and as there is not room in the Bureau of Chemistry for a force of clerks to check up and interpret the returns from the thousands and thousands of retail druggists, doctors and other people who handle from a grain to 2 or 3 ounces of coca leaves a year, it seems more like a tempest in a tea-pot. However, such a regulation comes under the present discussion because it adds one more piece of work to the already over-burdened druggist and dealer, who is beset with much unnecessary regulation already. If such regulations and orders become obnoxious, it is but a simple matter to remedy them, and the course is open to anyone affected, though many may hesitate to take such steps. Nothing should be construed in the statements which have just been made, which would appear to be antagonistic to well merited legislation, but it seems from a study of what we have at the present time, that we could dispense with a good deal of what we have now.

Before closing I want to say one or two words on the subject of fakes, and suggest what could be done by the pharmaceutical chemist to do away with this evil. The American Medical Association, and, spasmodically, some of the Journals, have exposed a number of fake products which have been foisted on the American public to the extent of many millions of dollars. The work done by

the American Medical Association, unfortunately, does not reach the public generally, except occasionally through some magazine article—and it is only through publicity, and continued publicity, that the sale of these pernicious things can be stopped. The retail druggist himself is not in a position to do this, because he immediately is sued for libel and is not able to defend his case in court. It was thought that the Food and Drugs Act would eliminate this problem to a considerable extent, and it undoubtedly has, but from the number of pernicious and weird things that have come to me for analysis during the past year or two, it would seem that this law is not able to reach all cases. For instance, we have here an article which is sold at the philanthropic price of \$25.00 to anyone who wants to prolong his life. It consists of a brass capsule, nickel-plated, filled with red oxide of iron and plaster of Paris, and which is connected with a wire to a plate which is attached to the ankle. The nickel-plated capsule is put in some water—ice water recommended—and the manifestations begin. Sometimes the philanthropic doctor who puts this out, sends a quart of tonic, at the very low price of one dollar, which seems to be a weak pickling liquor from the iron works or something of a very similar nature. Another interesting fraud is this little tablet which is advertised in the highest terms as being valuable for anybody, whether he is sick or well, and which is found, on examination, to consist of sodium tartrate and epsom salts. Another product which is apparently unique, is this liquid. It is recommended as an eye remedy, and is exploited for producing shiney eyes, especially among actresses. On examination it was found to be an essence of pepsin, and the scheme is somewhat unique, though in a way there is a basis for it, as we all know that a bad stomach makes a dull eye. Turning now to some articles for external use, I want to mention this hair remover, which, though not a depilatory, is especially recommended for women. This product seemed to be a paste which is to be warmed, spread on the face, and after cooling and drying, to be removed, taking with it the hair. Investigation proved it to be common rosin, with possibly a little added balsam or something to give it an odor, which, on application, was found to have marked sticking properties. It would unquestionably pull out the hair, but at the same time probably considerable of the epidermis. Another interesting fake which you may all try if you wish, is this wrinkle eradicator, which is sold at a very high price and which can be cut into various shapes and guarantees to do the trick with old and young. As you will note, it is nothing but an ordinary court plaster, sold at an exorbitant figure. It seems to me that all the organizations, manufacturers, retailers, wholesalers and medical bodies should resolve together to stamp out this abuse, and I believe if they would work in unison there certainly would be no fear of prosecution and they could accomplish results which would be beneficial to all. The Drug Trades Conference might consider this suggestion.

Editorial Notes and Announcements

JAMES H. BEAL, Editor.....Scio, O.

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished with not to exceed 50 reprints, without cover, of papers accepted for publication in the JOURNAL.

Larger numbers of reprints will be supplied by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.

200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.

50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.

100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.

200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.

50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.

100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.

200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co. Columbus, Ohio.

GREETING FROM HONORARY PRESIDENT A. B. LYONS.

To the Members of the American Pharmaceutical Association:

I take great pleasure in being able to send you a word of New Year's greeting. It has been very gratifying to me during my severe illness to receive from so many of you words of sympathy and expressions of a hope that my recovery might be speedy and complete.

Complete recovery I suppose that I cannot hope for, but I am happy in present freedom from discomfort, and especially in finding myself increasingly able to resume my wonted activities.

The wholly unlooked-for honor conferred upon me at Nashville, in my absence, calls for grateful acknowledgment. I accept it in the spirit in which it was offered—not as a thing I had a right to claim or expect. I trust that it may be possible for me yet to render to my chosen profession services such as shall justify your confidence.

A. B. LYONS.

<>

THE PRESIDENT ELECT.

As noted in the November issue of the JOURNAL, Mr. Caswell A. Mayo, editor of the *American Druggist*, has been duly elected to preside over the fortunes of the American Pharmaceutical Association during the official year 1914-1915, his official duties beginning with his installation at the 62d annual meeting, which will convene at Detroit, Aug. 24 next.

From an appreciative article by Thomas J. Keenan, who was for many years associated with Mr. Mayo in editorial work, we abstract the following:

"At the annual meeting of the Association in Nashville last August, Mr. Mayo's name and the names of two other pharmacists were placed in nomination by a committee, and after the meeting adjourned these names were submitted by mail to every member of the Association, with a request that the member indicate his preference on a ballot enclosed for the purpose. On October 24, the ballots were counted by the official board of canvassers, when it was ascertained that Mr. Mayo had been elected by a plurality of votes. In accordance with the by-laws of

the Association, the installment takes place at the meeting in Detroit next year.

"Seldom in the balloting for a president of the American Pharmaceutical Association has such an intensity of interest been displayed or has enthusiasm run so high as in the present election. The opposing candidates were men of nation-wide fame and prestige, whose friends spared no effort to

CASWELL A. MAYO, New York,
President-elect, 1914-1915.

improve their chances of election. One has achieved prominence as the editor of a comparative newcomer in the field of drug journalism, and his candidacy was actively championed by a local association of pharmacists; while the other, enjoyed an extensive acquaintance among pharmacists throughout the country, and by creditable and long-continued activity in association work generally, had gained many loyal followers and zealous supporters. Both were connected in a teaching capacity with colleges of pharmacy.

"The prospects of Mr. Mayo's success at no time seemed very bright, and it was doubted by many whether the sterling obligations under which he had placed the membership of the American Pharmaceutical Association

by indefatigable industry in committee work during the years of his connection with it, would be recognized and acknowledged.

"Mr. Mayo's activity in the affairs of the American Pharmaceutical Association dates from 1892, the year which saw the passing of the lamented Prof. P. Wendover Bedford, though he was well known to some of the members from an earlier period, when he was associate editor of the *Druggists Circular*. Professor Bedford had been a very influential factor in the upbuilding of the Association, not alone in New York state, but in every part of the country reached by his editorial articles in *The Pharmaceutical Record*. The work which he was compelled to relinquish by death was taken up by Mr. Mayo, and how well the latter has served the Association, and through it the pharmaceutical profession of the United States, may be read in the pages of the *American Druggist* from the time he assumed the editorship in 1892 down to date.

"Two kinds of pharmaceutical journalism are recognized as having come into existence during the past quarter of a century. There is the kind which disseminates ideas, upholding high professional aims and directing the progress of pharmacy; and a contracting type which exploits the purely commercial features of pharmacy, catering principally to minds that seek cheap entertainment, or to those who have small regard for ethical considerations and are ready at any time to sacrifice the higher things of the profession for financial gain.

"In the conduct of the *American Druggist* Mr. Mayo has always striven to preserve the golden mean, and while insisting on a high standard of educational qualification for the pharmacist, he has not overlooked the commercial interests, nor the necessity of a sound training in business system and efficiency."

What Mr. Keenan has said concerning Mr. Mayo's untiring and valuable services to the Association will be heartily endorsed by the members of that body, who, without exception, regard his election to the presidency as a promotion well deserved, and who also believe that his many estimable qualities of heart and head fit him admirably to discharge with credit to himself and the Association the somewhat exacting duties of the high office to which he has been called. Long live the president-elect!

THE NEW PRESIDENT OF THE N. W. D. A.

The newly elected president of the National Wholesale Druggists' Association, George W. Lattimer, was born in Columbus, Ohio, December 6, 1856. His literary education was obtained in the public schools of that city, at a preparatory school in Cleveland,

GEO. W. LATTIMER,

President of the N. W. D. A.

and at Amherst college, from which latter he graduated in June, 1879, with the degree of bachelor of arts. After a short period spent in the study of law, Mr. Lattimer went to Colorado and became interested in the mining business, but a year later returned to Columbus, and shortly afterwards became secretary and treasurer of the Hocking Valley Coal Mine Company. In 1882 he associated himself with George B. and Linus Kauffman in the formation of the wholesale drug firm of Kauffman, Lattimer & Rising, which, following the withdrawal of Mr. Rising, was changed to the firm Kauffman, Lattimer & Co. In 1888 the business was incorporated as The Kauffman-Lattimer Co., of which Mr. Lattimer has been from the beginning, and is at the present time, secretary and treasurer.

Mr. Lattimer attended the organization meeting of the N. W. D. A., in 1882, and has since that time been a constant attendant and

active member, filling various official positions and committee chairmanships. Perhaps his most valuable work has been done as chairman of the Committee on Fire Insurance, and it is said that as a result of the efforts of this committee the cost of insurance to wholesale druggists has been reduced from a general average rate of \$1.45 to an average rate of 45 cents.

In his home city Mr. Lattimer has been prominent in many civic and commercial enterprises. He has been president of the Columbus Chamber of Commerce, president of the Columbus City Park Commission, and a member of the State Board of Arbitration, and was a member of the State Floods Commission, which was charged with the distribution of the funds raised for the relief of the sufferers by the flood in the spring of 1913, acting on this body as the representative of the American Red Cross Society. He is president of the Central Philanthropic Council, which is a consolidation of the organized charities of Columbus, and is also a trustee of the Humane Society.

He is a member of the Columbus Club, the Columbus Athletic Club, and was one of the founders and is a director of the Columbus Country Club.

The esteem in which Mr. Lattimer is held by his fellow citizens, as evidenced by the numerous civic and other honors which have been conferred upon him is held to be abundantly warranted by his business associates who have been in close touch with him for so many years. He represents the very best type of American citizenship, liberal in his views upon all subjects, always ready to contribute of his time and means to the welfare and uplift of his fellowmen, diligent in business, faithful in the discharge of every trust which he accepts, and has always been a sturdy supporter of the highest principles of commercial honesty in his business relations.

His numerous friends in his home city and throughout the state feel that his election to the presidency of the N. W. D. A. was an honor most worthily bestowed, and deem themselves also honored through his elevation to that position.

Of General Interest

THE NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION THIRTY-NINTH ANNUAL MEETING, JACKSONVILLE, FLA., NOVEMBER 18, 19 AND 20, 1913.

The first session of the meeting was called to order by President Albert Plaut of New York on Tuesday morning at 10:30 o'clock, and the Divine blessing was invoked by Rev. Dr. French of the First Presbyterian Church of Jacksonville. Judge Swearington, the Mayor, then welcomed the association to the city and his address was responded to by Mr. Lee M. Hutchins in a speech full of wit, humor and poetry. The reception of delegates to the association then took place, and Dr. Adolph W. Miller presented the fraternal greetings of the American Pharmaceutical Association, to which Mr. Ludwig Schiff made a fitting response. Mr. Lee Willisee brought the best wishes of the New York State Pharmaceutical Association to which Mr. C. Mahlon Kline made reply. Mr. Thomas F. Main voiced the most cordial greetings of the New Jersey Pharmaceutical Association, to which Mr. S. Massingham responded.

President's Address.—President Plaut then delivered his address, which we regret that lack of space compels us to summarize, so full was it of wise suggestion and helpful thought. General business for the last thirteen months, he said, had been quite good, the volume of imports and exports of the country being by far the largest in its history. He spoke of the interference with European trade caused by the Balkan war, and deplored in strong and feeling language the evils of all wars, which he said were caused by greed and selfishness. He referred to the Mexican internecine conflict and hoped that it might be soon succeeded by a permanent peace founded upon justice and law. He spoke of the near completion of the Panama Canal as a monumental epoch-making

work in its effect upon the intercourse of the world. He referred to the recent tariff-legislation as being that which all had expected and said that its effects having been discounted, as soon as business had adjusted itself to the new lines, he thought the trade-outlook for the coming year was encouraging. As to the income-tax he said he thought it the fairest of all taxes if properly administered and that it had come to stay as a part of our fiscal system, for while it was not a burdensome tax, it produced an enormous revenue. He approved the reform in currency-legislation now being considered by Congress and predicted extensions of the parcel-post. He gave strong commendation to the Harrison anti-narcotic bill, but said that to be effective it must be supported by efficient state legislation. He called attention to the slight decrease in the active membership of the association, and stated that it was in accordance with the natural course of events, which would be likely to reduce the number of wholesale druggists in the country still more. He passed in review several interesting court decisions, among these being those of the Wisconsin Syrup cases, and the Sana-togen case, and quoted at length a decision of Judge Grubb of the U. S. Court at Birmingham, Ala., giving legality to certain acts of the Southern Wholesale Grocers' Association, and said that this decision clearly shows that there is a wide field in which an association of wholesalers could legally work, and in which it could produce results of great value to its members. He spoke in commendation of the Sherman law and suggested that the time might come when a merchant who cuts prices would be fined and imprisoned the same as railroad officials are penalized if they cut rates. He approved the work of the Eleventh International Congress of Pharmacy, and said it might in time lead to a universal Pharmacopœa and uniformity of laws regarding sales of medicines in all civilized countries. He recommended the association to petition Congress for the speedy adoption

of the metric system by the United States. He commended highly the services of Messrs. Holliday and Toms, the General Representative and the Secretary of the association, and in conclusion voiced his appreciation of the honor bestowed upon him by his election to the Presidency and also of the loyal and earnest support accorded him by all the members.

The Secretary's Report.—The Secretary reviewed the important work of his office, commented upon the number and importance of the bulletins issued by it and announced the forthcoming production of "The Green Book" to supersede "The Red Book," published in 1911. He reported the present membership as being 260 active and 326 associate members.

The Treasurer's Report.—This report showed:

Receipts from all sources.....	\$29,356.38
Disbursements	21,828.31
Balance	\$7,528.07

Report of Committee on Commercial Travelers and Selling Methods.—The committee called attention to the lack of marked success of mail-order drug-houses; spoke of the necessary qualifications in a salesman; suggested that more thought should be given to selling-policies; discussed over-solicitation of orders; approved the establishment of a telephone-detail to solicit and receive orders; spoke of the advantages of providing automobiles for certain classes of salesmen; recommended that members discourage the parcel-post business and long-distance reverse calls, the payment of freight-charges, and the solicitation of "splits." It recommended direct settlements with customers, the use of an itemized expense account by salesmen, discussed their proper compensation and approved "The Uniform Vacation Plan" which, they said, was highly recommended by those who had adopted it.

Committee on Credits and Collections.—This report discussed the question of cash-discount customers, noting that little change had taken place in the number of that class during the year, except in the South, where there was a slight improvement, and says, "a due regard for the welfare of our customer, as well as that of ourselves, suggests the wisdom of counselling with him on this subject on all proper occasions." It suggested the

need of caution in the extension of credit to "the confectioner class of crafty nomads, employing names irreconcilable to their nationality and as changeable as their places of abode. Keen and unscrupulous, he devotes his talents rather to the framing of clever get-aways, than to the upbuilding of a permanent business along honorable lines." It emphasized the importance of fire-insurance in relation to credit; recommended the adoption of uniform terms and discounts, and it condemned, as "most insidious," methods which prevail in certain sections in transgression of a fair and just system, and strongly recommended the charging of interest on past-due accounts. It suggested that where accounts are closed by notes, that these be made payable monthly and so drawn that "default in the payment of one would automatically mature the others." It condemned over-solicitation of orders, deceptive claims of percentage of profit by manufacturers and advanced dating, and recommended co-operation in the matter of credits and collections.

Committee on Employer's Liability and Workmen's Compensation.—The report of this committee was so complete and so replete with facts, figures and argument that it does not admit of summarization with justice to so admirable a document. It should be read in its entirety, not only by every employer, but by every person interested in social reforms. One of its paragraphs will show the idea of the committee in relation to this question: "Whether you choose to see in this prevention movement a growing realization of our social responsibilities or a mere desire to save dollars, the result is sure to be far-reaching and beneficent." The committee says that we should not neglect to study the experience of foreign countries, in order that we may not be overzealous in "our endeavor to right long-standing wrongs," and recommends that the members investigate the possibilities of mutual-liability insurance.

Committee on Fire Insurance.—The report of the committee called attention to the small number of fires in wholesale drug establishments and gave a list of those which had occurred during the year with their causes, losses, etc. Among these causes were the breaking of a bottle of bi-sulphide of carbon, the flood at Dayton, O., fuming nitric acid and the spontaneous ignition of sulphur which was packed in second-hand bags which

had probably previously contained niter or potash. This fire occasioned a loss of \$62,000. The report commented in strong language upon the enormous fire-waste of the country, which reached a total in 1912 of \$225,300,000, and urged the attention of the members to the ways of fire-prevention which were being advocated by the National Fire Protective Association and other bodies. It discussed the various charges for water-sprinkler service, and suggested a conference to determine an equitable charge for the same; the necessity for a uniform bill for reciprocal insurance and described in detail the legislation of several states regarding insurance matters. It entered at length into the question of automobile insurance and recommended that members endeavor to secure more equitable rates for same, as well as greater security from loss.

Committee on Proprietary Goods.—Their report called attention to the fact that the sales of these preparations in one-twelfth, one-sixth, and one-quarter-dozens were about ninety-four percent of the total sales—831 actual sales of one fairly popular preparation accomplishing the delivery of but 900 separate pieces, and claimed a larger remuneration for the jobber than it at present allowed. It condemned over-solicitation, "free goods," the granting to buying-clubs of the same terms allowed to jobbers, and discussed at length the question of fixed retail prices.

Committee on Legislation.—The report of this committee was most exhaustive of the subject of its activities. It described the National legislation of the year, and then took up in detail the changes which had been made in the laws of the various states. It recommended strongly uniformity of legislation in regard to food and drug laws.

Committee on Memorials.—This committee reported resolutions on the demise of twelve active and three associate members, with a short life-history of each.

Committee on the Prevention of Adulteration.—A most exhaustive and interesting report was presented by this committee. It congratulated the association upon the steady advance towards better conditions and said: "This widespread spirit of reform and improvement is a beneficent, effective accomplishment in the pharmaceutical industry and deserves our heartiest commendation and co-operation, though candor compels us to as-

sert that instances not infrequently occur which show that there is also need of the exercise of rare discretion to prevent senseless oppression and useless annoyance. There is nothing to be gained by ignoring the obvious fact that in this, as in all great reformative crusades, which have been inaugurated since the beginning of our history, rushing to extremes may result in harm from the activities of narrow-minded officials and enthusiastic but wholly impractical theorists. Popular enthusiasm is like all great forces, in that, while capable of yielding beneficent results when properly guided and restrained, can also work incalculable harm when directed only by prejudice." It called attention to the fact that "high-power papain" could be made by the addition of pepsin to papain and that its sale might lead the seller to the courts. Another surprising statement of the report was that the Cramp Bark of commerce is not collected from the *Viburnum Opulus*, but is really the bark of the mountain maple (*Acer spicatum*) and that the description of *Viburnum Opulus* in the U. S. P. is that of maple bark and not of Cramp Bark. The committee say that the bark of the *Acer spicatum* has not only displaced the *Viburnum Opulus* in America but it has also done so in Europe, and that it would appear, from the use of the substitute, that the maple has a medicinal activity very similar to that of Cramp Bark.

Committee on Trade-Marks.—This committee had a lengthy and interesting report, citing numerous decisions of the courts in determining the rights of manufacturers in the names of their specialties; giving the amended law of the United States in relation to trade-marks, and stating much of interest to those who might desire to acquire a foreign trade-mark for their preparations, in its comprehensive review of the laws of different countries in relation to the same.

Committee on Transportation.—A most interesting and instructive report was that presented by this committee. The subjects treated in it were The Railways, Inter-State Commerce Commission, Freight Rates, Express Companies and Rates, Parcel Post, Panama Canal, Free Customs Port for New York, and Local Deliveries, and when it is said that each one of these subjects was treated most exhaustively it may be seen that it is impossible to summarize so excellent a report. It should be read in full by

every one interested in any one of these subjects.

Committee on Anti-Narcotic Legislation.—This committee reviewed the proceedings of the National Drug Conference and the various steps which led to the passage of the Harrison Anti-Narcotic Bill by the House of Representatives and gave also a list of states that had adopted anti-narcotic laws during the past year.

Committee on Local Associations.—This committee laid it down not only as a moral principle but as a standpoint of policy that "it would be best if each wholesale drug-house throughout the country could realize that the most lasting or enduring success can be best obtained, in fact can only be obtained, by establishing a fixed policy and by conducting its business upon a clean, legitimate basis, relying upon service, quality and candid, fair, honest treatment in order to secure patronage."

Board of Control.—This board in various reports concurred with the recommendations of the committees and this affirmative action was approved by the convention.

After the passage of several complimentary votes by the convention the officers-elect present were installed into their respective offices. The officers-elect for the coming year are:

President—George W. Lattimer.

First Vice-President—F. C. Groover.

Second V. P.—Charles F. Michaels.

Third V. P.—Charles E. Potts.

Fourth V. P.—C. S. Littell.

Fifth V. P.—G. S. Fleece.

Secretary—Joseph E. Toms.

Treasurer—Samuel E. Strong.

Board of Control—Charles Gibson, Chairman, James W. Morrison, George R. Merrill, Mr. Bedwell, John T. Kennedy.

General Representative—F. E. Holliday.

After the installation of officers the Convention adjourned. The place selected for the next meeting is Indianapolis, the time to be probably early in October. The Convention also voted to meet in Del Monte, California, in the year 1915.

The banquet was a most notable occasion. It was served in the main dining-room of the Windsor Hotel on Thursday evening, and the menu was a most attractive one. Mr. John W. Durr acted as toastmaster. The speakers of the evening were the retiring President, Mr. Albert Plaut; George W.

Lattimer, the new President; Judge W. T. Bland, who spoke for "Florida, Past, Present and Future"; Duncan U. Fletcher, who spoke on "Deeper Waterways"; Charles S. Adams, who responded to the toast of "The Ladies." The President's reception was held on Tuesday evening and was a most delightful occasion. The other entertainments were an automobile ride and reception for the ladies on Wednesday, a steamer-trip on the River St. Johns, and on Friday one hundred and twelve of the Convention left Jacksonville for a trip to Havana, Cuba, an excursion which took a week to accomplish.

E. C. M.

Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the editor on the day following the meeting, if possible. Minutes should be *plainly* written, or type-written, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

CITY OF WASHINGTON BRANCH.

(October Meeting.)

This meeting, held October 15, 1913, at the National College of Pharmacy, was the first meeting of the local Branch for the winter of 1913-1914, and in the absence of the President, Dr. Lyman F. Kebler, who was out of the city on official business connected with the Department of Agriculture, Mr. W. S. Richardson acted as Chairman. In the absence of the Secretary who was detained on urgent personal business, Mr. S. L. Hilton acted as Secretary.

The first paper presented was "The Opportunity for Selection and Breeding in Drug Plant Culture," by Dr. W. W. Stockberger. The speaker introduced his subject by pointing out that until recently very little was done along the lines of procuring plants

carrying greater drug percentums by culture, all efforts having been directed in producing hybrids.

The object of drug culture was, he stated, to produce varieties or strains of plants which would show marked increased drug constituents, and at the same time give future plants continuing the same results.

From the results already obtained, there is sufficient ground for future work, for, as a fact, the constituents of medicinal plants, especially those containing alkaloids, have been increased.

Observation has shown that no two plants act the same under cultivation, and plants of the same species grown in different locations vary largely as to constituents. In some cases these constituents were inactive or inert, and in others the constituents appeared more active than normal. This condition, the speaker stated, was under investigation.

Another object of this culture was to cultivate authentic specimens of medicinal plants that proper standards can be maintained and established.

While many of the forest drugs have been cultivated in the field and garden, experiments are now being conducted with conditions as nearly like that of the natural plant as it is possible to make them.

Dr. G. A. Russell followed Dr. Stockberger and outlined in detail the work being done at the gardens in Madison, Wisconsin, and the results which had so far been obtained there. He brought out strongly the necessity for only lightly covering seeds, stating that to do otherwise meant absolute failure. The cost of producing some plants of the experimental scale had been prohibitive of inducing commercial enterprise, but such was not the case in the majority of the plants cultivated. Nearly all the plants needed as much attention as would plants in a truck garden.

Dr. Russell gave extensive details of the experiments with pyrethrum, wormwood, stramonium and horehound. In calculating the cost of these experiments, great care has been taken to figure on the bases of land and labor rather than dollar and cents, for the reason that land and labor cost varying amounts in the different localities.

The second paper of the evening was on the subject, "The Possibility of Increasing the Alkaloidal Content of Belladonna Plants,"

by Mr. A. F. Sievers of the Bureau of Plant Industry, Department of Agriculture.

Considerable discussion followed the reading of each paper by all who were present.

Respectfully submitted,

HENRY B. FLOYD.

CITY OF WASHINGTON BRANCH.

(November Meeting.)

The meeting was called to order November 19 by the President, and after disposing of routine business, the program was taken up. Dr. H. A. Seil of New York City discussed observations on *asafetida* and *balsam Peru*.

Asafetida.—The *asafetida* problems during the past five years were briefly reviewed. Various kinds of *asafetida* were discussed. The standard proposed by several European workers, based upon the amount of combined sulphur present in *asafetida*, was considered very inadequate, because it would countenance adulteration, in some instances, to the extent of fifty percent. The so-called pepper *asafetida* was referred to as a very low grade product. The cooperative work engaged in during the past year showed that the lead number was a good index as to the quality of the *asafetida* examined.

The most valuable portion of the standard recognized by the Pharmacopœia is the fact that the material to be known under the designation "*asafetida*" is to be derived from certain sources.

There appeared to be no difficulty whatever in manipulating the article itself in other respects so as to comply with the pharmacopœial requirements. The ash limit is of no particular value. The practical worthlessness of the alcohol solubility test is shown by the fact that when it became known to the dealers abroad that *asafetida* containing less than 50% of alcohol soluble material would not be permitted entry, they soon found ways and means whereby to raise this deficiency, if any existed. The fact is that adulteration was ascertained through the trade long before it was possible to show that actual adulteration did exist by the usual methods of analysis. In time, however, methods of analyses and circumstantial evidence were sufficient to justify detention of *asafetida* and in some instances some of the *asafetida* was not permitted en-

try, notwithstanding the protests made by some dealers. In discussing this matter Dr. Kebler called attention to the fact that during the Russia-Persian War, the trade represented that it was impossible to obtain asafoetida of proper quality and it was incumbent upon the Agricultural Department to meet the situation. This was done by the Treasury Department issuing a decision permitting entry of asafoetida containing not less than 35% of alcohol soluble material, provided it be used under certain conditions. Soon after this decision was promulgated, the adulteration to increase the alcoholic soluble material was resorted to. The trade was very much disturbed because of the detention of asafoetida containing the requisite quantity of alcohol soluble matter. Protests were entered, but there appeared to be no doubt whatever but that the asafoetida was deliberately manipulated. The entrance of such asafoetida was refused.

During the last year or so, asafoetida of good quality has been offered at the ports, containing the proper alcohol soluble material, and so far as it has been possible to determine, free from adulteration. It would, therefore, seem desirable to abrogate the present decision.

The chief difficulty, however, in the whole situation is the fact that none of the asafoetida worked on so far by analysts is apparently of known authenticity. All data appear to be based on unknown material, and we cannot expect to place the matter on a satisfactory basis until authentic material is collected, and carefully examined.

Others who discussed the paper were Messrs. Bradbury, Emery, Hoover, Ewing, and Wilbert.

Balsam of Peru.—The article discussed was the so-called imitation balsam which has been offered for import for a number of years. The earlier shipments were found to contain considerable quantities of resin. This substance was, however, not found in later shipments. All the examinations show that the material has been constantly changing in composition, which was probably due to the variation in manufacture of the commodity, as well as the use of different basic ingredients. The contention of the manufacturer and importers was that the article complied in every particular with the tests laid down in the Pharmacopœia. They seem to forget, however, that a part of the standard of the

Pharmacopœia was that the material must be derived from a certain tree. The imitation product if permitted entry into the United States could be readily mixed with the genuine material without much prospect of its being detected. The incentive to do this is increased by the fact that the imitation is much cheaper than the natural.

During the past year not much of the imitation balsam was offered at New York City, and the indications are that it is being shipped to the home of the natural balsam and there mixed. The methods used for detecting the imitation were described. It was pointed out that the methods originally devised to detect the imitation were not applicable to samples examined a year or so later.

The same question as to uncertainty of authentic material was raised as in connection with asafoetida.

The subject was discussed by Messrs. Bradbury, Jackson, Seil and Kebler.

The Traffic in Smoking Opium.—Mr. A. B. Adams, Chemist of the Internal Revenue Department, spoke of the work of that service in conjunction with the illicit opium traffic in the United States. He exhibited a smoking outfit and indicated the manner in which opium smoking is usually conducted. The cunning of the dealers and purveyors of illicit opium is almost beyond human conception. It happens at times when raids are made on places known to be trafficking in illicit opium, no indications of the business could be positively established. A case was cited where such a raid was made and that in disposing of the opium by throwing it into the sewer, some of the material accidentally splashed upon a brick. The brick was removed from the wall and the material splashed on the brick examined. It was conclusively shown that the material was opium and a conviction followed.

In many instances it was necessary to depend upon the evidence obtained in the examination of residues left in containers or rags used in the manufacture of smoking opium. In order to successfully prosecute it is incumbent upon the Internal Revenue Office to show that smoking opium was actually manufactured. It is believed by some that the Government actually licenses the manufacture of smoking opium. This is absolutely erroneous. The fact that no opium is permitted entry into the United States ex-

cept for medicinal purposes would preclude the issuing of such licenses. He spoke with great gratification relative to the voluntary discontinuance of certain pharmaceutical houses in the manufacture of extract of opium which is considered simply a variety of smoking opium. He regretted exceedingly, however, to state that some manufacturers refused to discontinue this practice and that the Department was not in position to force them.

Attention was called to the fact that a manufacturer of glass ware refused to sell the Department certain materials because the Government handled distilled liquors, but did supply illicit manufacturers of smoking opium with jars in which to handle the commodity. They may have been perfectly innocent in this transaction, but the indications did not point that way.

A can of genuine smoking opium containing $6\frac{3}{4}$ ounces was exhibited and the statement was made that in New York City this package would bring \$40. If this can should bear the Internal Revenue stamp, which was formerly used in conjunction with smoking opium imported into this country, the price of the can would be \$90. The same amount of the common extract of opium would bring about \$20.

Attention was called to the difficulties which have been encountered in the enforcement of the law, due to a recent court decision. In course of discussion it developed that some of the opium smokers smoked as many as two or three dozen pellets at one sitting. They did not consider the extract of opium or the smoking opium as made in this country as satisfactory as the genuine material imported into this country. The method of expressing this fact is by stating that "it had too much kick," by this, meaning evidently that it contained too much morphine. The fact was also established that smoking opium was prepared from the ashes of residues left from the first smoking and the article thus prepared often contained a high percentage of morphine.

The paper was discussed by Messrs. Stewart, Jackson, Hilton, and Kebler.

Federal Control of Habit-Forming Drugs.
—Mr. S. L. Hilton read a communication entitled "The Present Status of Federal Control of Habit-Forming Drugs." Mr. Hilton reviewed briefly the efforts made during the past few years toward the regulation of the

importation and sale of habit-forming drugs into the United States, by the Federal Government particularly. Attention was, however, directed to the recent efforts of the National Drug Trade Conference which resulted in the drafting of an anti-narcotic bill, now popularly known as the "Harrison bill." This bill has for its primary purpose, regulating the distribution and sale of opium, morphine, cocaine, coca, their derivatives and preparations in the United States. The bill was introduced in Congress by Representative Harrison and was passed by the House in extra session. It was then taken up by the Senate, where it was read twice and referred to a sub-committee for consideration. There does not appear to be very much likelihood of the bill being passed in extra session and from the activities at present, it does not appear likely that the bill will pass without considerable opposition.

Mr. Hilton appears to be of the opinion that the drug trade ought to have followed up the bill rapidly after its passage in the House and thus avoid massing of opposition due to an interim of time. The bill is opposed in a number of quarters and unfortunately there is an open rift in the retail trade.

The recent Treasury decision, having for its object regulating cocaine, coca, their derivatives and preparations, from the time they enter United States to the ultimate consumer was also discussed. Mr. Hilton considered the declaration illegal and oppressive. He stated that it would be impossible even for the Government officials to buy these commodities without declaration and that in transferring it from one individual to another in the same Department, the declaration would be required.

Mr. Hilton referred to Mr. Stewart, an attorney, who had given the decision considerable attention, and suggested that he be extended the privilege of making some remarks, which was granted.

Mr. Stewart stated that in his opinion the Treasury decision exceeded the authority granted by Congress, that there was no question whatever but that the Government under the Food and Drugs Act was empowered to deny entry to cocaine or coca, but that it did not have the power to regulate these commodities after they had been once entered. This power, however, could readily

be given under the law if Congress would slightly modify the Act.

In discussing the paper, Dr. Kebler reviewed briefly the various steps taken previous to the issuing of Treasury Decision No. 33456. The Government under the Food and Drugs Act detained a vast amount of smoking opium offered at the San Francisco port and smaller quantities at several other ports of entry. The contention raised was that importers were not advised of the contemplated action under the law and therefore the smoking opium detained should be released and the trade informed as to the position of the Government relative to this commodity.

At the request of Dr. Wright, who had been appointed a special commissioner looking to the study of anti-narcotics and subsequent legislation, it was agreed to allow this Act to remain in abeyance, giving him an opportunity to secure specific legislation by Congress. The result was that an opium act was passed in February, 1909, excluding opium for other than medicinal purposes. As we have heard tonight, while it does exclude smoking opium, it did not preclude the surreptitious manufacture of smoking opium in the United States from opium presumably imported for medicinal purposes. In the fall of 1911, a tentative regulation was sent out by the Agriculture Department, tending to regulate the importation of opium, morphine, cocaine, coca, their derivatives and preparations. Much opposition developed to the regulation as framed, but no one appeared to be opposed to that part of the regulation tending to control cocaine or coca preparations. During the year 1912 some coca leaves were detained at the port on the ground that they did not bear a declaration as to the quantity or proportion of cocaine they contain and also because the leaves might be injurious to the health of the people of the United States. The importers of their own volition stated that they would be willing to label the packages as to cocaine content and also place their books at the disposal of the Department for the purpose of determining whether or not the drug was so used as to be deleterious to the public health. After a number of shipments were thus detained and permitted entry it was decided to make the enforcement uniform and accordingly the Secretary of the Treasury promulgated the Treasury decision in question. Dr. Kebler furthermore stated

that the Department was prepared to use its best efforts in controlling and regulating habit-forming drugs and that every possible assistance would be given to the passage of any law which would effectually accomplish this purpose.

Replying to Mr. Stewart's statement to the effect that the decision was not within the law, attention was called to Treasury decision governing the importation of *asafoetida* conditionally. In fact many imports have been permitted entry conditionally, but so far as is known no material objections have been raised to this practice until the cocaine decision was put into force and effect.

Mr. Hilton stated that the Harrison bill will accomplish almost what the decision would, and furthermore that the decision was conducive to smuggling.

Mr. Hilton was informed that it was impossible to see exactly how it induced smuggling any more than under present conditions, and furthermore that even though smuggling was resorted to in the past, it would not be any worse than at present. A case was cited where an attempt was made to smuggle 700 ounces of cocaine into the United States and that the smuggler is at present serving a term in prison.

The bill was further discussed by Messrs. Wilbert, Jackson, Bradbury, Richards, Stewart, and others.

The meeting was considered as one of the most profitable in the history of the local Branch.

Adjourned.

HENRY B. FLOYD, Secretary.

CITY OF WASHINGTON BRANCH.

(December Meeting.)

By invitation of Dr. A. S. Cushman and H. C. Fuller, director, and member, respectively, of the Institute for Industrial Research, the December meeting of the City of Washington Branch of the American Pharmaceutical Association was held at the institute's new building, 19th and B streets, N. W., Washington, D. C.

Before the meeting, Dr. Cushman and Mr. Fuller opened and lighted the entire building to the members and guided them through its modern and well-equipped laboratories. Many delicate and intricate experiments and

tests, relating directly to pharmacy and otherwise, now being conducted there, were explained and commented upon.

In the absence of the President (Dr. Lyman F. Kebler), the meeting was called to order at 8:30 by Mr. W. S. Richardson, the first vice-president. By motion, the reading of the minutes of the previous meeting was dispensed with.

Under new business, the treasurer reported a deficit which has existed for some years, and then upon motion, properly made and seconded, the secretary's report, showing expenditures for the current year, was accepted, without audit, and referred to the treasurer for settlement.

The committee on nominations, appointed at the November meeting, was then called upon to report. Mr. Lewis Flemer, chairman, requested Mr. H. C. Fuller, the secretary, to read the report of the committee, which consisted of Mr. Flemer, Mr. Fuller and Dr. George W. Hoover.

The recommendations of the committee were as follows: For president, Martin I. Wilbert; first vice-president, W. S. Richardson; second vice-president, Dr. Rodney H. True; secretary, Henry B. Floyd; treasurer, Wymond H. Bradbury; member of Council, Dr. Lyman F. Kebler; and further recommended that the office of secretary and that of council be separated.

Immediately following the reading of the committee's report, Mr. Wilbert declined the nomination for president. Discussion showed that the office of secretary and that of member of council had been separated in 1912 and that the term of the present member of the council did not expire until the end of 1914. The committee then withdrew its recommendation concerning the separation of the office of secretary and member of the council, and also withdrew all its nominations except that for secretary and treasurer.

From the floor, Mr. W. S. Richardson was nominated for president, Dr. Rodney H. True for first vice-president, and Dr. Henry E. Kalusowski for second vice-president. No other nominations being made, and one only having been made for each office, it was moved that the secretary be directed to cast the ballot of the Branch as a unanimous ballot in favor of the nominees. The secretary invited attention to the fact that he was on the list of nominees and suggested the selection of some other member to cast the ballot.

His suggestion failed to meet approval, whereupon he cast the ballot in favor of the nominees as directed. The acting president then declared the following officers elected for the year 1914: President, W. S. Richardson; first vice-president, Dr. Rodney H. True; second vice-president, Dr. Henry E. Kalusowski; secretary, Henry B. Floyd, and treasurer, Wymond H. Bradbury.

The election of officers having disposed of all new business for the evening, Mr. H. C. Fuller presented a paper entitled "Conservation in Relation to Pharmaceutical Chemistry." Mr. Fuller described clearly and forcibly existing conditions in medical and pharmaceutical chemistry, noting the persistency with which the manufacturer pursues the "almighty dollar." The "hit or miss" plan of mixing medicines, forming some new concoction to which is attached a high-sounding, valueless (and generally meaningless) name, with the hope that it will stay mixed and catch the fancy of the consumer, was lamented. Inadequate research work, insufficient therapeutic testing, incomplete analysis, and utter disregard for the well-established laws of chemistry, are bringing and have brought into the market each year thousands of valueless preparations which burden the shelves of the retailer. Yet he has to carry all of these because some smooth-tongued and gifted detail man has gotten one or two physicians in his neighborhood to write an occasional prescription for such mixtures.

The immense inroads made by a certain foreign firm manufacturing pharmaceuticals was commented upon, and the key of its success against American competition was attributed to the vast research work conducted by it. Not one of their preparations, it appears, is allowed to enter the market until its stability, therapeutic activity and exact chemical content has been definitely ascertained by most exhaustive experimentation.

The amount of research work done by American houses was compared with that of foreign and found to be all but nil.

A remedy was suggested for the prevention of fakes and other evils, in having the American Pharmaceutical Association establish an extensive chemical laboratory where the pharmaceutical products offered could be analyzed for their chemical contents and their therapeutic values ascertained. Reports of each analysis would be forwarded to its members and every man in the business

soon would know to an absolute certainty what each preparation he is selling is, and what it can be expected to do.

Such a laboratory would immediately expose fakes and eventually, when its findings would come to have the faith of the entire public, fake preparations would no longer be marketable. Pharmaceutical manufacturers would exercise greater care before presenting new preparations and the claims of value for such products. The retail druggist would profit because his shelves would contain only valuable and marketable matter.

Mr. Fuller presented specimens of a number of preparations recently analyzed, by the institute, and showed to what extent the public is fooled by well-written advertisements. A four-ounce bottle of diluted lactated pepsin, sold for a dollar, commanded much comment, for under a copyrighted name it was sold as a brightener of the eyes and a beautifier.

Wrinkle-removers, sold for the same price, proved to be nothing more than pieces of inexpensive court plaster. Diabetic and other foods for which fabulous and mythical claims have been made, and for which enormous prices have been asked, proved to be nothing but cheap, roasted grains. Hair-removers, costing \$1.50 a box, amounted to about five cents' worth of rosin and balsam mixed. The alkaloidal claims for cod-liver oil also came in for criticism.

In the discussion which followed, Dr. George W. Hoover stated that the Bureau of Chemistry has much unpublished information concerning these fakes, and if, as contemplated, a bulletin giving this information is published, much of general interest will come out and there will be some genuine surprises. There has been a decided improvement in the character of pharmaceutical products since the passage of the pure food act, and another decade will bring forth even greater improvements, is his belief.

The question of declaring various drugs, upon which Mr. Fuller touched, was discussed, and, in addition to the content declaration, it was suggested that the effect upon the system be outlined. Cocaine legislation, now so much discussed, furnished food for much controversy, the opinion of those present as to the ultimate effect of the legislation now proposed and recently enacted being about equally divided.

The wasteful methods employed by our

manufacturers was shown by example. Certain refuse thrown out now by chocolate manufacturers is worth \$100 to \$150 per ton, and lanoline, much finer than that now imported, can be made from the waste thrown out by woolen manufacturers.

Mr. Wilbert at this point called attention to the German Pharmacists Association, which has been doing work of the character outlined by Mr. Fuller (its laboratories being located in the Berlin College of Pharmacy), and whose findings have been going to its members as bulletins.

At this moment Dr. Kebler arrived but did not assume the chair. His trip to Hartford, Conn., in connection with a cocaine case, had been useless, as the defendant had "skipped" bail.

"Commercial Alcohol in Germany" was the next subject and was presented by Dr. Rodney H. True, who outlined conditions which have led to the extensive alcohol industry in Germany. It appears that this industry is a part of a great economic undertaking commenced by Frederick the Great and which has had hearty government support ever since. It was clearly shown that as an individual industry it was a failure, but as a part of an economic farming arrangement it had not been a failure.

Potatoes are much grown in the eastern or sandy provinces of Germany in land which would be called poor here.

Crops are rotated in the order of potato, grain and grass. The potato uses but little of the ash content of the soil and is deeply planted. While smaller than the American, it is higher in starch content and contains less water. The yield, with the deep planting noted, is about three times the average American crop, and it leaves the land in excellent shape for the grain to follow. In fact, the grain output has been doubled by this means.

Much of the potatoes are sent to the western provinces and to the cities, the major portion, however, going to the still. The mash left over is used to feed the stock. Altogether, this economic arrangement has been wonderfully developed, and, while no profit is obtained directly from the alcohol, it enters into this great plan as an inseparable and unreplaceable cog.

The plans for disposing of the alcohol, the societies for its protection, and the peculiar

conditions incident to this industry, were all minutely and interestingly described.

The American attempt to commercialize alcohol, while by no means a success, to date has shown enough to warrant a continuation of the experiments already made.

The effect of tax levies and the qualities of the potatoes came in for much good-natured comment and well-placed witticisms.

The question of the location of the permanent home for the American Pharmaceutical Association was then brought to the attention of the Branch. The proposed locations were discussed and much comment was made of any attempt to locate the home out of Washington. Mr. Wilbert spoke very feelingly and strongly in favor of its being located in Washington, where it would be free from the influences of politics and near the national legislative body of the country. It seems to be the logical situation for such a home as is proposed.

The following motion was then proposed, seconded and carried:

WHEREAS, It is proposed to provide a permanent headquarters or home for the American Pharmaceutical Association, and

WHEREAS, Efforts have been and are now being made to secure the location of this permanent headquarters in several widely separated cities, and

WHEREAS, The American Pharmaceutical Association is incorporated under the laws of the District of Columbia and is now operating under the general provisions of this incorporation,

Now, therefore, We, as members of the City of Washington Branch of the American Pharmaceutical Association, would respectfully remind the officers and the council of the parent organization that there are many and weighty reasons for locating the permanent home of the American Pharmaceutical Association in the city of Washington.

The secretary was also directed to bring this matter to the attention of the council.

The William Proctor memorial was also considered and it was urged that if it should be in the form of a statue and that if the American Pharmaceutical Association built here, the proper place for the statue would be in front of the home. "It would be better in our front yard than in the back yard of some government building," quoted Mr. Hilton, for he knows, as all Washingtonians do, that memorial statues of all but national

heroes are placed in obscure parks and "lost" forever. There are a dozen such statues in Washington, of which no one ever hears and few have ever seen; all are in a state of neglect.

Dr. Kebler, in closing, with well-chosen words thanked the branch for the honor which it had conferred upon him to elect him its president and for the hearty support he had received. In turn a vote of thanks was tendered him for his excellent programs and ever persevering efforts to better the branch.

A vote of thanks was tendered to Dr. Cushman and to Mr. Fuller for their kindness in tendering the use of the institute to the society, and it was directed that a note be recorded in the minutes of the motion.

The meeting adjourned at 10:45.

Mr. Albert Hale, of the Pan-American Union, was to describe the "Peru Balsam Industry," but was unable to remain after ten to deliver his talk. His address will be given at some meeting in the near future.

This meeting was held in the magnificently furnished and equipped library of the institute, and was one of the best attended meetings of the year.

Respectfully submitted,

HENRY B. FLOYD, Secretary.

NEW YORK BRANCH.

(November Meeting.)

A regular meeting of the New York Branch of the American Pharmaceutical Association was held on the evening of November 10th. Vice-President H. V. Army presided.

Following the reading of the minutes and the report of the Treasurer, Prof. W. C. Anderson, Chairman of the Committee on Legislation, reported that Dr. Alsberg, Chief of the Federal Bureau of Chemistry, had expressed the opinion that the treasury decision designed to regulate the traffic in cocaine would not be applied to sales of the drug on prescriptions as the prescriber's order was sufficient record. Professor Anderson pointed out that the decision made no exception and the matter was one of enforcement. Concerning the Harrison Federal anti-narcotic bill, the committee reported that there was renewed activity in Congress and that the passage of the measure seemed probable. As

an outcome of the enforcement of the State "day of rest law," Professor Anderson said, there had been started a movement for a law that would oblige druggists to close their stores on Sunday. He thought that such a step would lead to an increase in dispensing by physicians. The several pending congressional measures and other evidences of a desire for the curtailment of the sale of tablets of mercuric chloride were reviewed in the committee's report. The chairman was of the opinion that the greatest good would be accomplished through the prohibition of the publication of details concerning poisoning fatalities in the newspapers.

Prof. G. C. Diekmann presented the report of the Committee on the Progress of Pharmacy. Among other matters reviewed in the report were a report on the examination of medicinal substances, published in the *Sud-Deutsche Apotheker Zeitung*; an article on "Further Developments in the Physiological Examination of Digitalis," by Focke (*Zeit. Exp. Med. Therap.*), appearing in the *Pharmaceutical Journal*; a German article on the spontaneous combustion of fireworks; and an article on "The Relation of the Specific Gravity and the Evaporation Residue of Tinctures and Fluidextracts," by Ziegler (*Pharm. Zentralh.*). Professor Diekmann referred also to several items in the advance report of changes in pharmacopœial standards.

This report was discussed by Messrs. Mayo, Raubenheimer, Mansfield, and Murray.

Secretary Hugh Craig read a communication from George M. Beringer, the President of the parent association, in which reference was made to a proposition to have the association take some part in a drug, chemical, and food exposition to be held in Madison Square Garden, New York, January 19th to 26th next. Mr. Beringer suggested that the eastern branches of the association hold a conference in connection with the exposition and that the New York Branch initiate a movement for such a meeting.

After some discussion by Messrs. Craig, Roemer, Latham, Kantrowitz, Raubenheimer, and Murray a committee, consisting of John Roemer, Hugo Kantrowitz and J. H. Rehfuss, was appointed to investigate the project and report at the next meeting.

Hugh Craig, J. L. Mayer and B. L. Murray were appointed to constitute a Committee on Nominations.

Joseph E. Lauber, Esq., read a paper enti-

tled "Safeguarding the Use of Poisons." He contended that the aim of endeavors to safeguard the handling of dangerous substances should be to protect the ultimate user. To accomplish this, uniform, distinctive methods were, in his opinion, necessary. A distinctive shape for poisonous substances in solid form and a container of distinctive shape for solids and liquids, he believed, would afford the most effective safeguards. He favored the jackstone shape for poisonous solids.

Proper labeling, the speaker considered essential. And he thought that the label for poisonous substances should bear, in addition to the word "poison," a list of antidotes and directions for emergency treatment of the particular poisoning.

Mr. Lauber advised that the Branch appoint a committee to draw up a bill, enlist the support of the State Pharmaceutical Association, and work strenuously for its enactment, allowing no temporary failure to daunt it in such a worthy purpose.

The subject introduced by Mr. Lauber, particularly as it applied to mercuric chloride, was discussed to a considerable extent. C. A. Mayo stated that he had been informed that M. I. Wilbert, of the United States Public Health Service, had prepared a report on the much-agitated matter of the misuse of mercuric chloride, but that the service evidently had no plan of action in view. He considered the wrapping of each tablet in paper or foil to be the best safeguard. Otto Raubenheimer pointed out that the German Pharmacopœia requires that tablets of mercuric chloride be of a cylindrical shape, colored red, wrapped in black paper with a poison mark, and sold in a distinctive bottle. In his opinion a flat, square, green tablet would be better, and national legislation is essential to assure uniformity.

Prof. Jeannot Hostmann could see no valid reason why the sale of mercuric chloride tablets should not be restricted to prescriptions. Veterinary surgeons, he said, hand out the tablets indiscriminately. Joseph Weinstein expressed a similar view. Thomas Latham, referring to the widespread popular use of these tablets, said that this was the bichloride age in the cycle of results following newspaper publicity. J. H. Rehfuss believed that mercuric chloride was necessary to the public as a guard against septicemic infection. But he thought that its sale might well be limited to prescriptions or at least to weak solutions.

He stated that it was a common practice for physicians to leave the tablets in plain envelopes at the homes of patients. Professor Anderson was of the opinion that accidental poisonings with mercuric chloride were far less numerous than suicides. He was in favor of confining all selling and dispensing of these tablets to prescriptions.

Messrs. Mayo, Wimmer and Roller also took part in the discussion. As a result the following resolutions were passed and referred to the legislative committee of the New York State Pharmaceutical Association:

WHEREAS, The public welfare is endangered by the indiscriminate sale and distribution of bichloride of mercury; therefore, be it

Resolved, By the New York Branch of the American Pharmaceutical Association, that the public welfare demands that it should be made illegal to sell, dispense or give away bichloride of mercury in any form except upon the written prescription of a licensed physician or veterinarian, dispensed by a registered pharmacist or druggist.

WHEREAS, The increase in the use of bichloride of mercury tablets as an agent for committing suicide seems directly traceable to the sensational newspaper reports of cases in which it has been used; therefore, be it

Resolved, By the New York Branch of the American Pharmaceutical Association, that all newspapers which have regard for the public welfare be requested to refrain from mentioning the particular agent used wherever suicide is committed by means of poison.

John Roemer read a paper on "The Need of Authority for Non-Official Medicaments." This was in part an account of a conversation between a doctor who wanted to prescribe digitalin and a druggist who wanted to know what sort. The prescriber and the dispenser after considering in turn the standards or lack of standards of digitalis, its derivatives and preparations, arrived at the conclusion that pharmacy was somewhat behindhand in the matter of furnishing necessary information about many useful drugs.

Continuing, Mr. Roemer said that the Pharmacopœia did not, and scarcely could, keep abreast of the progress in medicine, and hence the composition of many remedials was unknown or wrongly stated. He decried the fact that pharmacists were obliged to rely upon the council on pharmacy and chemistry of the American Medical Association for information which pharmacy should furnish to medicine, and could from that source obtain but meager details and no standards. He

declared that there was a need for a central bureau under pharmacal auspices to examine and standardize new medicaments and many old ones.

In discussing this paper, Mr. Raubenheimer said that the committee of the parent association, on standards for unofficial drugs was designed to meet the need mentioned by Mr. Roemer. He agreed that a central laboratory was necessary for the proper carrying on of the work. J. L. Mayer instanced Vlemink's solution as an illustration of an official standardless preparation. The color and sulphur content, he said, were a matter of conjecture. Specimens he had examined contained from 3½ to 24 percent of sulphur. Several speakers pointed out the unreliability of physiological standardization.

Mr. Lauber and Mr. Roemer were formally thanked by the Branch.

HUGH CRAIG, Secretary.

<>

CHICAGO BRANCH.

(December Meeting.)

The December meeting of the Chicago Branch of the American Pharmaceutical Association was held Tuesday evening, the sixteenth, with an interested company in attendance.

After the disposal of business, Mr. E. N. Gathercoal introduced the subject of the evening, "The Pharmacognosy of the Rhamnus Barks." He showed specimens of the bark from *Rhamnus Frangula* and *R. cathartica*, which are European shrubs; *R. Purshiana*, *R. californica*, and *R. crocea*, from western United States, and *R. chlorophorus*, a Chinese plant. Also samples of barks used as adulterants of *Cascara* and *Frangula*, including the one found a year or so ago by Mr. Miller of Eli Lilly & Co., in a large lot of *Cascara*.

Mr. Gathercoal discussed the characters of the plant supplying each of these; mentioned its habitat and pointed out the external markings of each bark, their resemblances, as well as the features by which they may be readily distinguished. He stated that the adulterant found, but not identified, by Mr. Miller, disclosed in its internal structure all the ear-marks of a cherry bark, and, as on maceration in water, a slight odor of hydrocyanic acid was observed, it probably was from a species of cherry.

He also presented a review of the litera-

ture on the chemistry of the Rhamnus barks and showed the chemical tests proposed for the monographs of Rhamnus Purshiana and Frangula in the new U. S. P.

His part of the discussion was closed with a projection-microscope exhibit of sections prepared from the various barks and a description of the tissues of each, bringing out points of similarity and dissimilarity in their structure.

Mr. L. E. Warren, of the chemical laboratory of the A. M. A., Professors A. H. Clark, C. M. Snow, G. D. Timmons and W. B. Day and Messrs. J. H. Wells, Wm. Gray, I. A. Becker and C. F. Storer took part in the discussion.

W. B. DAY, Secretary.

NASHVILLE BRANCH.

(December Meeting.)

At the meeting of the Nashville Branch of the A. Ph. A. held at Furman Hall, December 11th, the By-laws were amended by making the fiscal year concurrent with the calendar year, as is the case with the parent body.

A social get-together meeting of local druggists and their wives was planned for January, and Messrs. Burge, White and Hutton were appointed as a committee to make the necessary arrangements.

Mr. Ira B. Clark then read a very interesting paper on the subject "Window Dressing." He stated that a drug store window was a valuable medium for advertising, although some seemed to think it useful only for the admission of light and as a repository for various drug-store junk. It does not require any special artistic ability to dress a window but a little application of gray matter and judgment in the selection of seasonable and profitable goods. He thought that the color to be used in dressing the window should either harmonize with the color of the article displayed or should be in sharp contrast with it. Red and green, blue and white, and orange and black harmonize well. Special emphasis was laid on price cards, as the story is just half told without them. Toilet articles, a combination of tooth brushes, powder and paste, "own preparations," olive oil, stationery, rubber goods, surgical goods, and occasionally a collection of prescription files, and a percolator in operation make good displays.

In conclusion, he strongly discouraged the

practice of advertising patent medicines in the drug-store window.

Following the reading of this paper a lengthy discussion was had on the subject participated in by M. E. Hutton, J. B. Sand, C. O. Prince and J. M. Rogoff. An amusing experience was told by Dr. Rogoff about a display of moth balls he once made in his window. An Italian who had just arrived in America, walked in and bought two packages. In a few minutes he returned with an angry look on his face and a stiletto in his hand and, approaching the doctor, shouted, "Candy stinks!"

Dr. J. O. Burge read a report on Alcresta, Prof. Lloyd's new alkaloidal reagent, and Dr. E. A. Ruddiman exhibited a sample of it he had just received.

A motion was made by W. R. White looking to the establishment of closer relations with the Academy of Medicine, and a committee was appointed for this purpose.

The Branch then adjourned.

WILLIAM R. WHITE, Secretary.

PITTSBURGH BRANCH.

(December Meeting.)

The initial meeting of the Pittsburgh Branch for the winter season took place Friday evening, December 12, at the College of Pharmacy. Too many strenuous duties devolving upon the officers and the dependable members made it impossible to get the wheels to going around earlier, as they should have done.

This meeting was honored by a short visit from Chancellor McCormick, of the University of Pittsburgh, for the first time.

A communication was read inquiring into the possibility of securing a suitable place in this end of the state at which the 1915 meeting of the Pennsylvania Pharmaceutical Association could be held. After discussion and reference to a number of points that might be considered in this connection, the matter was referred to the secretary as a committee to investigate and if a suitable place can be found it will be presented and recommended at the 1914 meeting of the P. Ph. A.

On motion, President Campbell named the following committee on nominations: J. A. Koch, Louis Saalbach, B. E. Pritchard. After serious consideration as to available candidates who could be depended upon to render

service, the following ticket was named: President, Andrew Campbell; vice-presidents, Chas. E. Willets, P. G. Walter, L. K. Darbaker; secretary, B. E. Pritchard; treasurer, P. Henry Utech. Committee chairmen: Membership, J. S. O'Brien; practice, W. H. McDonald; medical relations, Geo. W. Kutscher; education and legislation, John C. Wallace; publicity, B. E. Pritchard; program, F. J. Blumenschein. The report was on motion received, and there being no objections nor nominations from the floor, the nominees will be voted for at the January meeting in conformity with the by-laws.

From the question box the accompanying prescription was taken with the statement that after having been twice prepared, by different dispensers, it had thrown down a brown precipitate and information as to what caused it was sought for:

Sodium salicylate.....	drams 2
Sodium bromide.....	drams 1½
Caffeine citrate.....	grs. 36
Aqua menthae pip.....	ozs. 1½
Syrup simplex, q. s.....	ozs. 3

The suggestions made were that it was probably due to some impurity present in the sodium salicylate; that a trace of iron due to coming in contact with a spatula in compounding, but as these were merely conjectures the problem was referred to the Committee on Practice for solution.

Louis Breyer, class 1913, Pittsburgh C. of P., favored the Branch with a valuable talk on window displays. He said: "The three cardinal points to be considered in window displays are what to display, how and when. No window display can prove successful in selling goods that has not been given thoughtful consideration and planned for in advance. It is too important a branch of business getting to be gone at in a haphazard, hit or miss manner. Some of my best results from window advertising have been obtained after having given three or four weeks careful study and laying out of plans. In one store where I was employed there was a large stock of a face cream which was considered dead and had been allowed to cumber the stock room until it had become a nuisance. I took hold of that item and made up a striking window display with it as a prominent feature. It had previously been held at the cut rate schedule as to price, but in this exploitation I placed a

card bearing the full retail price, with the result that while it had failed to move before at a reduced figure, during the life of this display we disposed of \$75.00 worth, which proves that it is not essential to demoralize prices to produce results.

On another occasion on an order for five cases of Welch's grape juice there came through an error 50 cases. Upon notifying the shipper he requested that the excess quantity be held subject to order. It occurred to me that while so large an amount was on the premises it might as well be earning something, so I determined to make a big window display while there was plenty of material for the purpose. This plan I carried out so successfully that before the shipper could place the goods elsewhere the entire 50 cases were sold, and at full price, no cut being necessary to make sales. And, mark you, this was not in a big, prominently located city store either. Mr. Breyer described in more or less detail several striking displays that had been pulled off, as well as others which are just in process of evolution for future use. For so young a man Mr. Breyer has splendid ability and bids fair to rise to the top as a window display artist.

During the discussion following Mr. Breyer's talk, President Campbell described a very attractive and novel display for window use involving the arrangement of a series of bottles carrying water under air pressure to simulate the process of distillation, accompanied by a sign which read, "Distilling Witch Hazel for our Trade," which caused quite a run on witch hazel of more than a temporary character. Mr. Campbell made use of the blackboard in showing how this scheme was worked out.

Dr. J. A. Koch was on the program for a talk on "The London Drug Market," but before entering upon that topic he presented a very instructive and interesting report of the proceedings of the International Pharmaceutical Congress at The Hague, to which he and Prof. J. P. Remington were sent as representatives by the A. Ph. A. Dr. Koch took his audience on a very enjoyable and instructive tour through the famous drug market of the world, which is located in Mincing Lane, London, where practically all the crude drugs from every country in the world are primarily marketed. He described the methods in use for conducting the regular public sales at which the market quotations for

crude drugs are fixed. He exhibited a number of lists of such drugs as were to be offered at certain dates in which appeared shipments from almost every drug growing country on earth. There are numerous firms having quarters in the market place, each one specializing in certain products. Some show but one line such, for instance, as what we know as Gum Benzoin, but that name does not appear in the lists; there it is known as Gum Benjamin. Other brokers show only Asafœtida of all sorts and conditions, still others various grades of Tragacanth, while Cardamom Seeds in endless variety engage the attention of others.

The study of methods used by the natives in packing and preparing drugs for shipment from the country of their origin is a revelation to the visitor, as is likewise the very open and fair manner in which the drugs are shown to prospective buyers. No one is ever asked to bid without full knowledge of the character and condition of the article offered, so that cheap, poor quality, worthless drugs found on the market are there with malice aforethought, and not because it just happens to be a bad lot, a fact which shoppers for low prices in drugs should keep in mind.

The pamphlet containing an abstract of all the changes proposed for incorporation in the forthcoming Ninth Revision of the U. S. Pharmacopœia was presented for discussion and consideration, but owing to the lateness of the hour, it was on motion referred to Dr. Louis Saalbach to examine and bring up such portions thereof as he deems worthy of discussion at the January meeting.

B. E. PRITCHARD, Secretary.

SAINT LOUIS BRANCH.

(December Meeting.)

The Saint Louis Branch of the American Pharmaceutical Association held a regular meeting in the Saint Louis College of Pharmacy, Friday evening, December 19, 1913. The meeting was called to order by Vice-President Schulte. The minutes of the previous meeting were adopted as read.

Under the order of new business, Mr. Wilkerson made a motion which carried, that the subject for discussion for the next meeting be the use of shorter names and synonyms for some of the U. S. P. and N. F. preparations. The program was then

taken up. Mr. Schulte presented a paper on "Windows and Window Dressing."

On motion of J. W. Mackelden, seconded by C. T. Buehler, Mr. Schulte's paper was received.

In the discussion of Mr. Schulte's paper so many good points were brought out that it was decided to make it one of the papers for the January meeting.

There being no further business, and on motion, the meeting adjourned.

JULIUS C. HOESTER, Sec'y.

The Pharmacist and the Law

ABSTRACT OF LEGAL DECISIONS.

CONDITIONAL SALE—BANKRUPTCY—PREFERENCES. A soda fountain was sold on a contract of conditional sale about five months before proceedings in bankruptcy were begun against the purchaser. The seller claimed the proceeds in the hands of the trustee. The contract of sale was never recorded as required by the law of Missouri, in which State the bankrupt resided. Three days before the proceedings were begun the bankrupt gave the seller a chattel mortgage upon the property somewhat in excess of the price in the contract, and this was duly recorded. In the interval between the contract and the mortgage the bankrupt incurred other debts in its business aggregating more than the value of the property in question. The seller claimed under the contract and the mortgage independently. It was held that the contract of sale, not being recorded, was void as to subsequent general creditors of the buyer and its trustee. As the bankrupt was hopelessly insolvent when the chattel mortgage was executed, and the claimant's representatives had reasonable ground to believe a preference was intended, and would result from the mortgage, it was held to be void as against the bankrupt's trustee. But it was held that the right of subsequent creditors to urge their objections to the contract and mortgage was defensive merely against the seller so as to invalidate a lien giving a preference on distribution on bankruptcy, and did not entitle the creditors to priority in the distribution of proceeds as against the seller. He

was entitled, on filing his claim as a general one, to participate equally with the subsequent creditors in the distribution of the bankrupt's estate.—*L. A. Becker Co. v. Gill*, 206 Fed., 36.

VALIDITY OF SALE BY BANKRUPT PARTNER.—One of the members of a partnership conducting a soda fountain business, joined in a sale of the stock and fixtures to the father-in-law of his partner, and retired from the business, which was continued by his former partner alone, but in the firm name. On a petition by his trustee to have the sale set aside it was held that the fact that the partner who continued to carry on the business thereafter contracted indebtedness on the strength of his possession of the property afforded no ground for an attack by the bankrupt or his trustee on the validity of the sale.—*In re Young*, 206 Fed., 187.

SALE OF STOCK—SELLER'S REMEDIES—RIGHT TO RETAIN ADVANCE PAYMENT.—In an action to recover back the advance payment made on the purchase of a stock of drugs, it appeared that the plaintiff contracted to purchase the defendant's stock, paying \$2,500 in cash, and agreeing to pay the balance on delivery of the bill of sale when the statute relating to sales in bulk had been complied with, which would require at least five days. The plaintiff took possession and retained it for 24 hours. He then claimed that he had been induced to purchase by fraudulent representations, and demanded that the defendant take back the stock and repay the cash already paid. The defendant took charge of the store and continued to operate it in all respects as though no sale had been made or contemplated, selling a large proportion of the stock and purchasing new goods. It was held that the sale was entirely executory at the time the plaintiff repudiated it, and the defendant, having again taken possession before title passed, could not enforce specific performance. His only remedy was an action for damages for breach of the contract to purchase. The seller would only be entitled to retain the advance payment as damages for the purchaser's breach of contract. That would ordinarily be the difference between the market value of the stock at the time of the sale and the contract price. But the defendant did not counterclaim for damages. All he asked was a dismissal of the case with costs. As he did not deny that he was placed in the identical position in which he was before the plaintiff took possession, his dam-

ages were only nominal. His action in retaking the goods and exercising acts of ownership over them constituted a waiver of his right to either sue upon the contract or bring an equitable action to enforce it. The plaintiff was held entitled to recover the advance payment made.—*McCrea v. Ford*, *Colorado Court of Appeals*, 135 Pac., 465.

SCOPE OF EMPLOYMENT—UNLICENSED CLERK—A master is not liable for every wrong which the servant commits while in the performance of his contract of employment. His responsibility only attaches when the servant is acting within the real or apparent scope of his employment and in line with his duties. Suit was brought against the proprietors of a drug store for injuries to the plaintiff due to the alleged negligence of an unlicensed clerk in putting pure trikresol on the plaintiff's arm, which was thought to be blood poisoned. The complaint alleged that after a physician who was in the store at the time had requested the clerk to prepare a 1 percent solution of trikresol for use on the plaintiff's arm, the physician left the pharmacy, and the clerk negligently, and because of his incompetency in undertaking to fill the prescription, prepared for and gave to the plaintiff a quantity of pure and unadulterated trikresol, which caused the injury complained of. It was held that the substantive act alleged was the supplying of a dangerous solution of medicine, when a harmless or beneficial one had been prescribed, and that this constituted negligence within the scope of the clerk's employment, for the result of which the master was liable. It was also held that the sale of the trikresol by the unregistered clerk was conclusive evidence of negligence under the Oregon Statute L. O. L. 4750, declaring that it shall be unlawful for any person to sell any drug, medicine, or chemical, or to dispense or compound any prescription of a medical practitioner, unless such person be a registered pharmacist, or a registered assistant pharmacist. Judgment for the plaintiff was affirmed.—*Goodwin v. Rowe*, *Oregon Supreme Court*, 135 Pac., 171.

RECORDING SALE OF POISONS—CONSTRUCTION OF STATUTE.—The Delaware statute, 24 Del. Laws, c. 140, 14, provides that before delivering to a customer strychnine, arsenic or corrosive sublimate or any poisonous compound, combination, or preparation, thereof "there shall be recorded in a book kept for the purpose the name of the article, the quantity delivered, the purpose for which it is al-

leged to be used, the date of delivery, the name and address of the purchaser, and the name of the dispenser." In the first case under the statute it appeared that the defendant had sold bichloride of mercury to a customer and entered the sale on a slip of paper showing the sales for the day, which with other daily slips were regularly put in an envelope kept in his safe. It was held that this was a violation of the statute; but in view of the defendant's evident desire to abide by the law, only the minimum fine was imposed.—*State v. Hopkins (Del.)*, 88 Atl., 473.

CONTRACT FOR SALE OF DRUG STORE FIXTURES.—An offer and acceptance for the sale of drug store fixtures were in the following form: "We propose to furnish and erect complete in your store at Charleston, W. Va., the following fixtures: 25-foot wall case (McLean style); 18-foot tincture shelving; 11-foot patent medicine case; 6-foot tobacco case and humidor; 6-foot mirror; 12-foot B work counter; 12-foot B partition; 18-foot 6-inch settee upholstered in green leather; 7-foot 6-inch mirror, above settee; 14-foot 6-inch "L" case; 36-foot cases; 5-foot wrapping counter, glass front and sliding floor; 10-foot laboratory table. Exposed parts of alcove in solid veneered mahogany, all glass bevel plate and all mirrors No. 1 grade same, metal back; all cases to be all plate—plate shelves 10-inch marble base; finish—best quality, hard polished and rubbed. Complete plans, specifications and details to be submitted and approved by purchaser. Price, \$2145. Bernard Glocker Co., per Leon Shipman. Accepted: Jas. A. Carr, Carr's Drug Store." In an action for damages for breach of the contract by the defendant, the defendant argued that until complete plans, specifications and details were submitted by the plaintiff and approved by the defendant, the contract was incomplete, not binding on, and therefore revocable by either of the parties. The court did not agree to that conclusion, because Carr did not give the plaintiff an opportunity to prepare and submit plans and specifications for his approval. Within an hour after accepting the order, he arbitrarily sought to revoke it, assigning as the only reason that he had purchased the same fixtures from another company at a materially reduced offer. It was held that the contract was mutually binding on both parties and that Carr could not revoke it. His refusal to take the fixtures in conformity with the contract was a breach thereof.

The contract was not invalid because of the concluding clause thereof. It was sufficiently definite in description of the fixtures.—*Bernard Glocker Co. v. Carr, West Virginia Court of Appeals*, 79 S. E., 732.

SALE OF COCAINE—PROOF.—On appeal from a conviction for an unlawful sale of cocaine it was held that if the sale was made upon the prescription of a physician, that fact lay particularly within the knowledge of the defendant, and consequently it devolved upon him, and not upon the state, to establish it. There was no direct evidence that the negro boy to whom the sale was made was not a physician or dentist; but the presumption was that he was neither, and therefore, if he was a physician or dentist, it devolved upon the defendant to prove it. There was a prima facie presumption that the person to whom the sale was made did not belong to the exceptional class of persons to whom the right to practice medicine or dentistry has been given; the presumption relieving the state from the necessity of proving the negative.—*Miller v. State, Mississippi Supreme Court*, 63 So., 269.

ALTERATION OF CONTRACT AFTER DELIVERY OF GOODS.—Action was brought upon a contract for the sale of a quantity of hair tonic to a drug store. The defense was alteration of the contract after delivery of the goods. The contract provided that the plaintiff agreed to contract with a certain advertising company for a certain number of lines of advertising, specifying the Tribune and Journal newspapers, which were published in the defendant's town, the advertising to be executed during a year following delivery of the goods. It further provided that the plaintiff agreed to take back at invoice price all goods remaining unsold in the hands of the purchaser "at the end of the Iowa advertising contract." The defendant claimed that the word "Iowa" had been added to the contract after delivery, which was denied by the plaintiff. The jury found for the defendant. On appeal it was held that the alteration of the contract after delivery by the insertion of the word "Iowa" was material, since that made the rights of the parties depend, not upon the contract for advertising in the particular papers specified, but upon the termination of such Iowa advertising contracts as the plaintiff might have made. Judgment for the defendant was affirmed.—*Hessig-Ellis Drug Co. v. Todd-Baker Drug Co., Iowa Supreme Court*, 143 N. W., 569.

NOTICES OF JUDGMENT— FEDERAL.

No. 2448—*Adulteration and Misbranding of Orangeade*. Labeled "Orangeade." Consisted of a solution of invert sugar and tartaric acid, flavored with orange oil and colored. Frances Croppe Co., Chicago, Ill., shippers. Condemnation consented to. Minnesota.

No. 2450—*Misbranding of Turpentine*. Substitution of at least 21 percent of mineral oil. Southern States Turpentine Co., Cleveland, Ohio, shippers. Product destroyed. New York, S. D.

No. 2459—*Adulteration and Misbranding of Extract of Peppermint*. Substitution of peppermint, water and alcohol. Moses R. Stern, New York, shipper. Plea of guilty. Sentence suspended. New York, S.

No. 2463—*Adulteration of Tincture of Iodine*. Standard of strength and purity differed from test laid down in U. S. Pharmacopoeia. W. C. Field, Washington, D. C., seller. Plea of guilty. Fine of \$5. Dist. of Columbia.

No. 2475—*Adulteration of Oil Coriander*. Contained approximately 20 percent of caraway oil. James B. Horner, New York, shipper. Plea of guilty. Sentence suspended.

No. 2476—*Adulteration and Misbranding of Oil of Cloves*. Mixed with ethyl alcohol. Crandall Pettet Co., New York, shippers. Plea of guilty. Fine of \$50. New York, S.

Council Business

COUNCIL LETTER No. 6.

PHILADELPHIA, PA., Dec. 8, 1913.

To the Members of the Council:

Motions No. 10 (Appropriation of \$250 for Committee on Membership), No. 11 (Appropriation of \$25 for Women's Section), No. 12 (Increase of Salary of Editor of Journal), and No. 13 (Election of Members, applicants Nos. 9 to 17, inclusive), have each received a majority of affirmative votes.

Motion No. 14 (Appropriation of \$25 for National Drug Trade Conference). Moved by J. H. Beal, seconded by J. A. Koch, that the sum of Twenty-five Dollars be appropriated for the use of the National Drug Trade Conference. The motion has been approved by the Committee on Finance.

Motion No. 15 (Election of Members). You are requested to vote on the following applications for members:

No. 18. Julius C. Hoester, 108 S. 4th St., St. Louis, Mo., rec. by H. M. Whelpley and J. W. Mackelden.

No. 19. Alexander Benjamin Journeaux Moore, 12 Winchester Ave., Westmount, Pro. Quebec, Canada, Dean of the Montreal College of Pharmacy, rec. by J. W. England and J. H. Beal.

No. 20. Mary R. Hamilton, Pinney St., Rochester, Pa., rec. by Mary L. Creighton and J. H. Beal.

No. 21. Miriam Grace Truby, Penn and West Sts., Wilksburg, Pa., rec. by Mary L. Creighton and J. H. Beal.

No. 22. John Francis Walsh, 12 Fort Square, Greenfield, Mass., rec. by Elie H. LaPierre and Chas. E. Hoey.

No. 23. Lawrence Stanton Brigham, 1 Gordon St., East, Savannah, Ga., rec. by Robt. A. Rowliniski and J. H. Beal.

No. 24. John Abner Handy, P. and P. Department, Larkin Co., Buffalo, N. Y., rec. by Joseph P. Remington and J. H. Beal.

J. W. ENGLAND,
Secretary of the Council.

COUNCIL LETTER No. 7.

PHILADELPHIA, PA., Dec. 13, 1913.

To the Members of the Council:

The following Budget of Appropriations for 1914 is submitted by the Committee on Finance:

Proposed Budget of Appropriations for 1914.
Item.

1	Salaries	\$ 6,500
2	Journal	5,000
3	Printing, postage and stationery..	1,000
4	Clerical expenses, Secretary's office	1,000
5	National Formulary.....	1,000
6	Miscellaneous expenses.....	300
7	Drayage, freight and expressage..	150
8	Stenographers	250
9	Traveling expenses.....	300
10	Committee on membership.....	750
11	Committee on unofficial standards.	300
12	Proceedings and Year Book.....	2,500
13	Badges and bars.....	50
14	Certificates	50
15	Premium on Treasurer's bond....	50
16	Insurance	50
17	Journal for reporters.....	35
18	Section on Scientific Papers.....	25
19	Section on Education and Legislation	25
20	Section on Commercial Interests.	25
21	Section on Practical Pharmacy...	25
22	Section on Historical Pharmacy..	50
23	Section on Pharmacopoeias and Formularies	25
24	Women's Section.....	25
25	National Syllabus Committee.....	25

\$19,510

While the appropriation for the JOURNAL is fixed at \$5000, and warrants will be drawn against this, the net cost of the JOURNAL will be much less by reason of the receipts from advertisements.

Do you approve of budget of appropriations for 1914 as above proposed? This will be regarded as *Motion No. 16 (Approval of Budget of Appropriations for 1914)*.

At the Nashville (1913) meeting the following resolution was adopted:

"Resolved, That the Council be authorized to approve the production of a convenient button or pin style of the official badge of the Association, that may be worn conveniently at all times by members, and that this form of the official badge be distributed to dues paid members by the Treasurer."

In accordance with this resolution, bids from several makers of badges were obtained. In the judgment of President Beringer and General Secretary Beal, the designs and bid submitted by the Whitehead & Hoag Co., of Newark, N. J., are the most satisfactory.

Design No. 3 was selected.

"Sketch No. 3 shows the round button, 9/16" with a white field, shield enameled blue with a gold border. No. 3-A is the layover which shows what the cutout shield would be with a gold border and a blue ground. The enamel surface will be nicely stoned and polished.

We can furnish any of these designs at the following net prices, f.o.b. Newark, N. J.

In lots of	Gold finish and hard enamel	Gold Plate and hard enamel	Double Gold Plate with rolled gold shoe and hard enamel
1000.....	.11 each	.14 each	.19 each
2000.....	.10½ each	.13½ each	.18½ each
<i>Future Order Prices</i>			
500.....	.11 each	.15 each	.19 each
1000 and			
2000.....	.10 each	.13 each	.18 each

The prices quoted provide for furnishing the emblems with regular screw buttons, jeweler's catch pins or stick pins; or an assortment of these styles may be had in an order without extra charge."

(The Whitehead & Hoag Co., Charles S. Robbins, Mgr., Philadelphia Badge Department.)

Motion No. 17 (*Appropriation of \$250 for badges and pin buttons*). Moved by G. M. Beringer, seconded by J. H. Beal, that the sum of \$250, or as much as may be necessary, be appropriated for badge buttons and pins in accordance with the resolution of the Nashville (1913) meeting, that the badges and pins be supplied to dues-paid members of the Association at the price of twenty-five cents each, which shall include cost of postage, and that the Secretary of the Council be authorized to order one thousand badges and pins, assorted, of best quality, design No. 3, as per bid submitted by the Whitehead & Hoag Co.

The appropriation is approved by the Committee on Finance.

The suggestion has been made to present the badge free to new members, but it is felt by General Secretary Beal that this proposition should be left to a later date, probably about the time the State Association meetings are being held.

F. T. Gordon, who presented the resolution at the Nashville Meeting for a button badge, writes:

"My opinion is that we should have a button badge worth wearing and keeping, and that such buttons should be sold to present members at cost, and that they should be presented by the Association free to each new member on becoming a member of the Association, as a badge of membership. New members could also purchase the present official badge, if desired, but the button badge would, as President Beringer writes, be an excellent aid to the Committee on Membership if given without cost to new members. Present members, I am sure, would be willing to pay 20 or 25 cents for a button badge that would last for years and be worthy of the Association. As a matter of fact, I firmly believe that a good test of the interest of members in the Association could be made just this way, notifying them through the JOURNAL that the button badges could be obtained at cost and that the other expenses would be defrayed by the Association. Those who are worth-while members would get them, the others would probably pay no attention to the matter."

J. W. ENGLAND,

Secretary of the Council.

UNITED STATES PUBLIC HEALTH SERVICE.

(Changes in Pharmacists' Assignments, etc.)

Phelps, E. B., Professor of Chemistry. Directed to proceed to Wilmington, via Raleigh, N. C., upon request of the State Board of Health, for the purpose of investigating the local water supply and making recommendations in respect thereto. Nov. 21, 1913.

Voegtlin, Carl, Professor of Pharmacology. Directed to proceed to Savannah, Ga., for conference with the officers engaged in pellagra investigations. Nov. 21, 1913.

BOARDS CONVENED.

Board of medical officers convened to meet at the Bureau for the purpose of preparing questions for the mental examination of eight pharmacists of the Service, to determine their fitness for promotion. Detail for the board: Assistant Surgeon General W. G. Stimpson, chairman; Assistant Surgeon General W. C. Rucker, member; Surgeon J. W. Schereschewsky, recorder. Dec. 2, 1913.

Boards of medical officers convened for the purpose of conducting the mental and physical examination of certain pharmacists of the Service to determine their fitness for promotion to the grade of pharmacist of the first class:

Marine Hospital, Detroit, Mich. Senior Surgeon H. W. Austin, chairman; Assistant Surgeon J. Bolton, recorder.

Marine Hospital, San Francisco, Cal. Surgeon R. H. Woodward, chairman; Assistant Surgeon L. O. Weldon, recorder.

Marine Hospital, Chicago, Ill. Surgeon J. O. Cobb, chairman; Assistant Surgeon D. S. Baughman, recorder.

Marine Hospital, Key West, Fla. Passed Assistant Surgeon H. M. Manning, chairman; Acting Assistant Surgeon S. D. W. Light, recorder.

Marine Hospital, Savannah, Ga. Passed Assistant Surgeon R. M. Grimm, chairman; Acting Assistant Surgeon A. M. Cleborne, recorder.

Marine Hospital Building, Cincinnati, O. Passed Assistant Surgeon W. H. Frost, chairman; Assistant Surgeon H. M. Weill, recorder.

Board of medical officers convened to

meet at Fort Stanton, N. M., for the purpose of conducting the mental and physical examination of Pharmacist Harri D. Leach to determine his fitness for promotion to the grade of Pharmacists of the second class.

Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or type-written.

Improved Bacterial Therapy

SEROBACTERINS

(Sensitized Bacterial Vaccines)

"Action sure, rapid, harmless and durable."—A. Besredka.

Serobacterins are suspensions of bacteria "sensitized" by treatment with specific immune serum.

The advantages of Serobacterins may be briefly summarized as follows:

1. **SEROBACTERINS** do not cause opsonic nor clinical negative phase. In the process of sensitization the bacteria are saturated with the specific antibodies, consequently they do not absorb antibodies from the patient, preventing unfavorable reactions or the so-called negative phase.

2. **SEROBACTERINS** produce immediate active immunity.

(24 hours after the first injection an effective immunity is present and marked improvement is usually noted in the condition of the patient.)

This rapid action makes them invaluable in treatment and in preventive immunization. This is of great importance in controlling or preventing epidemics.

3. **SEROBACTERINS** cause no local or general reactions.

(These reactions constituted the principal undesirable feature of the Bacterial Vaccines.)

4. **SEROBACTERINS** produce a highly efficient and durable immunity.

The following **SEROBACTERINS** are supplied in the popular Mulford Aseptic Glass Bacterin Syringe, ready for instant use.

Staphylo-Serobacterin. (Sensitized Staphylococcic Vaccine.)

Strepto-Serobacterin Polyvalent. (Sensitized Streptococcic Vaccine.)

Scarlatina Strepto-Serobacterin. (Sensitized Streptococcic Vaccine Scarlatinal.)

Typho-Serobacterin. (Sensitized Typhoid Vaccine.)

Packages of 4 syringes..... \$4.00

Single syringes..... 1.50

Each syringe one dose.

For a complete review of the literature on Serobacterins, see Mulford Digest for December.

PROPOSED BICHLORIDE LEGISLATION.

AS might have been anticipated by one familiar with the manner in which American legislation is initiated, the widely reported case of the Georgia banker who by mistake swallowed mercury bichloride tablets instead of headache tablets has resulted in a flood of all sorts of bills to regulate the manufacture and sale of tablets containing poisonous substances. Three or more such measures are now pending in Congress, and an indefinite number in the state legislatures which are in session, besides an innumerable crop of proposed city ordinances.

No two of these measures seem to be alike, and most of them contain provisions which would be absolutely impossible of enforcement, or could not be enforced without causing far greater harm than any benefit that could result from their observance.

Practically all of them exhibit the layman's ignorance as to the meaning of the word poison. Most laymen, and also some druggists and physicians who might be presumed to know better, seem to imagine that it is possible to draw a distinct line between poisons and non-poisons, while, as a matter of fact, nearly every known medicinal agent may be regarded as either poisonous or non-poisonous accordingly as the dose is large or small, and it might fairly be said that the only persons who feel confident of their ability to correctly define a poison are those who have not sufficiently studied the subject to know what they are talking about.

In other words, practically every agent which is capable of producing a pronounced therapeutic or physiological effect will also act as a poison if the dose be sufficiently large. Any definition of a poison is, therefore, imperfect unless it includes a consideration of the dosage, and any enactment which provides

simply that "poisons or poisonous substances," without further limitation of these terms, shall be kept and sold only in tablets of certain forms and colors is a dangerous menace to all who prescribe or dispense medical substances. For example, if a druggist or physician were on trial for dispensing or administering a poisonous tablet, the prosecution would undoubtedly introduce the evidence of toxicologists to prove the guilt of the defendant, and by such evidence it could be shown that very many commonly used drugs and medicines have occasionally produced death when administered in excessive doses or under improper conditions. In certain parts of the country common salt mixed with corn meal and water is a favorite poison for the neighbors' chickens, and cases of human poisoning from common salt, with fatal results, have also been occasionally reported. It is also alleged on good authority that salt is the suicidal agent most commonly used in China, occupying in that country in frequency of use the place that phenol does in this.

Druggists and physicians generally are aware of the fact that society contains numerous individuals who are so dissatisfied with the world and with their place in it that they would cheerfully seek relief in death if it were not for the stigma which attaches to suicide, and to the friends and families of those who are reputed to have destroyed themselves. To such unfortunates the Georgia case furnished an inspiration, since the taking of the bichloride tablets could be pretended to be accidental. And since the newspapers also reported the death as painless, the two greatest deterrents to the commission of suicide, shame and pain, were removed. Within a comparatively short time after that case perhaps a hundred or more cases of alleged accidental bichloride poisoning were announced; a number many times greater than had occurred in all the previous years during which mercury bichloride tablets have been known and used. When the cases became so common that newspapers ceased to feature them under scareheads, the epidemic began to decline, and we may expect that until the newspapers shall discover some other poisonous substance that can easily be taken by mistake and produce a painless death* we shall not have another epidemic of alleged accidental poisonings.

It would take us too far afield to consider all of the proposed legislative measures to regulate the subject. Those pending in Congress are sufficiently illustrative of the inanities and incongruities of the whole crop.

The Ashhurst Bill, S. 3392, would make it unlawful to import, export, or transport in any manner in interstate commerce "any substance or poisonous compound known as bichloride of mercury," except in the form of green colored cubes, "so as to be readily distinguishable from non-poisonous tablets of similar appearance in common use."

Just how green-colored cubes of mercury bichloride are to be made readily distinguishable from non-poisonous tablets of *similar appearance* is not set forth in the bill.

Neglecting this no doubt unintentional incongruity, a more important objection to the bill is that it would prevent the transportation in interstate commerce of mercury bichloride in any other form than green colored cubes. Consequently

*Poisoning by mercuric chloride is, of course, quite the reverse of painless.

any one desiring this salt for use as a reagent or for any one of the numerous chemical and technical operations in which it is employed would be compelled either to manufacture his own supply from the original ingredients or purchase it from some other manufacturer within the same state.

The L'Engle Bill, H. R. 9113, would make it unlawful to "produce, import, manufacture, compound, deal in, dispense, sell or give away any *poisonous* tablet, lozenge or troche not cubical in shape," or to "produce, import, manufacture, compound, deal in, dispense, sell, distribute or give away any *non-poisonous* tablet, lozenge or troche not in spherical or disc shape."

Aside from the fact that this bill would not apply to poisonous agents except when in the form of tablets, lozenges or troches, the bill is a curiosity in that it would apply within the territorial limits of the several states as well as in interstate commerce, in spite of the limitations of that excellent instrument popularly known as the United States Constitution.

The Cary Bill, H. R. 9237, which applies only to the District of Columbia, provides that it shall be "unlawful for any person licensed as a physician, pharmacist or druggist" "to prescribe, compound, or sell" "any drug, chemical, or compound of a poisonous character, especially bichloride of mercury in any form," without making a record of the prescription or order, the name, date, and address of the prescriber, the name and address of the person for whom intended, and the name and address of the purchaser, who in no instance shall be under twenty-one years of age. The prescription or order must be in triplicate,—one copy to be retained on file in the establishment where the substance is compounded or sold, one copy to be filed with the Health Department, and one copy with the Police Department.

Some of the curiosities of the Cary Bill are as follows:

(1) It applies only to "licensed physicians, pharmacists or druggists," and consequently any person not so licensed, e. g., a barber, street vendor or newsboy, might so far as this bill is concerned, sell poisonous substances of any character without limitation or restraint.

(2) It would apply to physicians' prescriptions containing among its ingredients any substance that might under any circumstances be alleged to be poisonous, which means that it would apply to the majority of useful medicinal agents.

(3) The patient if under twenty-one years of age, could not take his own prescription to the drug store, but would have to employ some one who had attained his legal majority to have the prescription filled for him.

The mild (?) penalty for any physician, pharmacist or druggist "failing to comply in any manner with the provisions of this act is a fine of one thousand dollars or imprisonment at hard labor for one year, or both. If the offense is repeated, the license of the physician, pharmacist or druggist is to be cancelled, "disqualifying such person from acting in that capacity," "directly or indirectly, forever."

It will be seen from the examples cited that mercury bichloride legislation is a live subject, and it behooves all who have anything to do in any capacity with the dispensing of drugs and medicines to actively unite in defeating such legislation or in securing its proper amendment.

In considering this subject early last year, the *Journal of the American Medical Association* made the wise suggestion that the U. S. P. Committee of Revision

should incorporate in the forthcoming Pharmacopœia suitable directions for the shaping and distinguishing of highly poisonous tablets. The same subject was also discussed editorially in this Journal, August, 1913, page 929.

The A. Ph. A., at the Nashville meeting adopted a resolution making the same recommendation to the Committees of Revision of both the United States Pharmacopœia and the National Formulary (see Sept. Journal, page 1041), and resolutions bearing upon the same topic and to the same effect were adopted by the National Drug Trade Conference at its recent meeting in Washington, reported elsewhere in this issue.

If the U. S. P. Committee of Revision will awaken to the importance of the subject, and adopt suitable regulations for the distinguishing of mercury bichloride and other dangerous tablets, it will relieve the situation in two ways:

1. The recognition of the fact that these regulations will shortly become a part of the law as the standard of the Federal and of the various State Food and Drugs Acts, will check the fury of legislators to secure special enactments upon the subject.

2. Those who insist upon immediate legislation will be likely to follow the lines of the Committee's regulations in their enactments.

It is to be hoped that the Committee of Revision will recognize the importance of the subject to medicine and pharmacy and utilize the opportunity which the occasion presents.

J. H. BEAL.

TRADE PIRATES AND OTHER THINGS.

RECENTLY the writer was consulted by a clergyman concerning the probable cost of making an analysis of a proprietary rheumatism remedy.

Upon gently suggesting that the expense of an analysis would probably exceed the cost of half a dozen packages of the stuff and also that it might be safer to consult a physician for the treatment of a case of "rheumatism," it developed that the sample had been furnished by a physician who had been using it in his private practice with extraordinary success, and that if the formula could be obtained he and his ministerial emissary were to go "cahoots" in its manufacture and sale to rheumatic humanity.

Other interesting details were likewise developed, but the most significant features of the negotiations were the theologian's complete inability to sense the moral obliquity of appropriating the fruits of some one else's labors without consent or compensation, and the readiness of the Aesculapian, who is a man of "some standing" in medical circles, to exchange the garment of professional regularity for the purple and fine linen of a patent medicine king, provided his actual connection therewith could be concealed under the convenient and all-embracing disguise of Co.

While it may be uncommon to find divinity and medicine uniting in a project of this kind, it is not unusual to find both physicians and laymen who condemn the use of patent medicines in the abstract but are quite ready to engage in the manufacture of one, provided they can find a good seller, their idea of a "good

seller" being one that already enjoys a good sale, and to appropriate without compunctions of conscience the ideas and enterprise of other men for their own benefit.

Nor is the practice of piracy in the 20th century confined solely to the patent medicine business. Drop into the first emporium you pass, whether of hardware or software, of dry goods or wet goods, and note how comparatively few of the articles displayed represent really original ideas, and how the majority are piratical imitations made by twisting, or coloring, or reshaping the ideas of other men in some unimportant detail, or by sticking together the portions stolen from different men.

The world may have gone without safety razors for 10,000 years, but let some one, by extensive advertising, create a demand for the article, and a legion of imitations immediately appear to appropriate the market created by the enterprise of the original successful man. Let some one devise a new soda water flavor, or a new game, or a striking method of advertising, or a new anything that is successful, and the sky is nearly obscured with its substitutes.

Apparently the bulk of the real thinking of the world is done by a comparatively few men, while the most of us consciously or unconsciously, just appropriate their ideas and turn them around or inside out, and persuade other people, and perhaps ourselves as well, that they are our very own. In fact a real new thought is about as rare as a new chemical element; most of those we think are new are combinations of thought elements that are as old as Greek philosophy.

Of course, there is a kind of special smartness required for the marketing of ideas, and this of itself is a kind of creative ability deserving of a certain amount of credit. So, also, a new combination of old things, or the standing of an old idea the other end up may add real value not present before the combination or inversion, and for these improvements the combiners or inverters may justly claim reward. Most of those, however, who supply substitutes and imitations are pure commercial pirates, appropriating the fruits of other men's labors without compensation, mere business hoboes whose mercantile progress is made by riding on the brake beams of other men's advertising trains.

The great naturalist, Alfred Russell Wallace, said the other day that the natural morality of man had not progressed beyond that of the maker of the first stone implement. From which, if correct, we may infer that for what seeming morality there is, we are indebted to art rather than to nature, and that 20th century honesty is either the enforced honesty of blue sky laws, and pure food and drugs acts, or the mechanical honesty of cash registers, and other automatic devices of wood and metal.

Scientific Section

Papers Presented at the Sixty-First Annual Convention

THE FIELD FOR DRUG-PLANT BREEDING.

DR. W. W. STOCKBERGER, PHYSIOLOGIST IN CHARGE OF DRUG-PLANT INVESTIGATIONS,
BUREAU OF PLANT INDUSTRY, U. S. DEPT OF AGRICULTURE.

In the decade which has just passed great advances have been made in the knowledge of breeding, and during the same period the practical service which breeding has rendered in the field of plant production has come to be very generally recognized and appreciated. The art of the plant breeder has now been exercised upon a large number of the plants from which materials for food or clothing are obtained or which serve for ornamental and decorative purposes, and as a result the number of new or improved varieties and strains of useful plants has been enormously increased.

In the face of all this progress the fact that, with a few notable exceptions, our medicinal plants have been almost entirely neglected by plant breeders seems to deserve an explanation. A brief statement, therefore, of the probable causes of delay in the inclusion of medicinal plants among the subjects of the plant breeder's art, and of the possibilities which the exploitation of this field seems to offer may be of more than passing interest to pharmacists generally.

Although the term breeding has become very familiar in recent years, a brief statement of the sense in which it is used in this discussion may contribute somewhat to clearness. The improvement of a plant, the object of which is to render it more serviceable to the purposes of man, may be effected by continually selecting for propagation such plants as conform most closely to the ideal sought, by the selection of spontaneous variations or sports, by the isolation and live breeding of forms presenting morphological variations, by the breeding of the so-called ever-sporting varieties, and by hybridization. Other methods of procedure might be mentioned but those just named will serve to indicate some of the various avenues through which the problem of plant improvement may be approached, and to gage the wide sense in which breeding is used in this paper in contrast to a narrow usage occasionally encountered which restricts the term to changes produced in plants as a result of sexual reproduction.

It was long since recognized that the medicinal qualities of plants are easily affected by culture, but practical breeders have been very slow to avail themselves of this knowledge. There can be little doubt that this failure to grasp the opportunity presented was largely due to the fact that the criteria of progress in medicinal plant breeding are of an order almost entirely unlike that which

includes the standards of fitness commonly employed by plant breeders. Such standards are usually based upon characteristics which are readily perceived by the senses, e. g., form, size, color, odor, agreeableness to the taste; or by those which are readily estimated by simple physical means, e. g., weight of yield, strength of fiber, hardness of grain; or again by those characteristics estimated by comparison, e. g., hardness, resistance to disease, drought, etc. On the other hand, the characteristics which the breeder of medicinal plants must use as his main guide can be determined only through the use of the technique and methods of the pharmaceutical chemist or of the pharmacologist. Probably few, if any, of the practical breeders have either the inclination or necessary skill for the estimation of the active principles which condition the value of medicinal plants, and the natural result is that their activities are directed along other lines.

A second cause for the small consideration given to medicinal plant breeding may be found in the disparity which exists between cultivated drug plants and many other economic plants with respect to their importance as marketable products. It is but natural that plants which have long been widely cultivated or which possess great commercial possibilities should be among the first to attract attention to the desirability of their improvement.

A third but by no means unimportant consideration is the relatively imperfect state of our knowledge with respect to the essential facts concerning the cultural requirements of many drug plants and the prevailing uncertainty as to the possible modifications in the nature or quantity of the active constituents of these plants which may be induced by variations in soil, climate or other environmental factors.

It may be well at this point to disavow any intent in the foregoing paragraphs to disparage in any way the very creditable work that has been done in recent years along the line of drug plant breeding, or to disregard the fact that the cultivation of a small number of drug plants has been successfully carried on in several localities in this country. On the contrary the object has been to show that as a whole medicinal plant breeding is as yet largely an untried field.

In this as in other new fields of endeavor it is advisable to heed the homely proverb, "make haste slowly," and misguided enthusiasm must not be mistaken for ability to produce practical results. The practical breeder will hesitate long before undertaking a line of work which may require years of time and the outlay of thousands of dollars to bring it to completion. First of all he will seek to establish an *ideal*, a clear cut mental picture of the end to be attained. This ideal will be a composite built up from a definite understanding of what is required, and from a thorough knowledge of the relationships and the morphological and physiological characteristics of the species which he is seeking to improve. The formation of these ideals must be preceded by a period of experimentation and study in order that the breeder may become familiar with the nature, requirements, adaptability and behavior of the plants in question. This preliminary course is all the more necessary since many of the medicinal plants upon which the breeder must work have been brought to this country from foreign lands, and many more which are indigenous here must be brought under cultivation in the course of which they may be expected to undergo certain modifications.

In the opinion of the writer the constructive work of the immediate future in the field of drug plant breeding will consist largely in extending our knowledge of the chemical constituents of these plants, in determining the relative value and relationship of their various characteristics and in fixing standards of breeding which will lead to definite economic results. Then as pharmaceutical chemistry leads the way and gives us further information concerning the nature of the active principles, there is every reason to believe that the selection of different pure lines of superior potency and their subsequent hybridization will result in the attainment of standards of production far in advance of those to which we are accustomed.

The work of the Bureau of Plant Industry on medicinal plant breeding was inaugurated by Dr. R. H. True, formerly Physiologist in Charge of Drug Plant Investigations. That he early recognized the necessity for a thorough preliminary study of the materials later to be used in breeding is evident from a paper prepared by him in 1906, in which with reference to breeding drug plants he says, "The pioneer work of finding out the necessary preliminary facts concerning culture methods and the demands made on soil and climate is only now being done. As soon as these fundamental conditions are fairly well understood, the cultivator will be in a position to refine and increase his product by the application of new methods." In harmony with the principle here expressed, the work has since been consistently carried on and in the Office of Drug Plant Investigations two correlated lines of work are now in progress, one a series of laboratory studies on the quantitative variation of the active constituents in a number of plants, and the other a series of comparative cultural tests conducted in widely separated localities.

The character of the laboratory investigations is well illustrated by the paper by Mr. A. F. Sievers, entitled, "Individual Variation in Belladonna Plants as a Basis for Improvement by Selection," and by that of Mr. Frank Rabak entitled, "The Effect of Geographical Source on the Volatile Oil of Hops," both of which have just been presented for your consideration. The cultural tests carried on at the several field stations have for a common object the determination of the fitness of a large number of drug plants for the conditions offered by each locality, a study of the possibility of bringing under cultivation various wild plants yielding important drugs, the selection of strains or individuals which promise to serve as valuable material for the further purposes of breeding, and the acquiring of data relative to the localities of situations offering the most favorable economic conditions for the commercial production of certain medicinal plants.

At Madison, Wisconsin, where the Office of Drug Plant Investigations is conducting its investigations in co-operation with the University of Wisconsin, there are now under observation approximately forty-five species of which belladonna, henbane, stramonium, a number of the mints, cannabis and grindelia may be mentioned. At the two stations located near Washington the number of species being studied is much larger. Here some solanaceous species and others yielding valuable essential oils are receiving special attention. A study of the perfume roses is also in progress, the purpose of which is to select and improve the varieties best suited for the production of oil of rose in this country.

At Timmons ville, S. C., the work is largely concerned with cannabis, species of capsicum and a few oil bearing plants. In Florida, where the station is at present located at Orange City, we find one of the most interesting parts of our field. Here the opportunity for the selection and improvement of plants yielding essential oils is very promising and the data so far secured with respect to camphor, monarda, rose geranium, lemon grass, citronella grass, and a number of other species clearly show that further important results will be obtained by continuing the present line of investigations. For example, strains of *Monarda punctata* have been developed by selection which give an unusually high yield of an oil containing the valuable constituent thymol. We are now seeking to increase the percentage of thymol in the oil through suitable modifications in the conditions of growth of this plant.

To extend this discussion further would perhaps be a presumption upon privilege but if the remarks just made on the work of the Office of Drug Plant Investigations have suggested something of the scope of the field of Drug Plant Breeding, the purpose of this paper is fulfilled. It may be permitted to say in closing that the breeding of medicinal plants not only offers much in a very practical way but also affords a field for the greatest scientific activity.

THE PAPAIN OF COMMERCE.

WILLIAM MANSFIELD, NEW YORK.

Much has been said and written about papain, yet much more needs to be said and written about it before its adulteration can be stopped, and before it will be possible for it to occupy the place in our materia medica that it should.

Papaw—*carica papaya*—is a tree cultivated in southern Florida, tropical America, and in all tropical countries. It is supposed that the parent trees from which the present cultivated forms were derived originally grew wild in the West Indies. In proof of this, it is definitely known that the papaw tree was not known in India and other tropical countries before the discovery of America. Under favorable conditions a tree grows to a height of twenty feet. The unbranched trunk is light green and smooth, except for the leaf scars. The leaves are light green above, paler beneath, five to seven lobed, the lobes again divided into smaller lobes; the petioles of the leaves are frequently 1.5 dm. long. The leaves occur in greatest numbers at the top of the stem where they stand nearly erect. The older, larger leaves droop and finally fall away as the trunk increases in length. There are three types of flowers borne on as many different trees. The fragrant staminate flowers are in slender panicles, one to three dm. long; the calyx 1.5 mm. long; the corolla is saucer shaped, 3 cm. long; the slender tube is dilated at or near the top. The lanceolate lobes of the corolla are shorter than the tube. The ovary, if present, is rudimentary and no stigma is developed. The pistillate flowers occur singly or in groups of two or three. The calyx is about 5 mm. long and does not fall off after fertilization. The lanceolate petals stand erect to a height of 2.5 cm. The egg-shaped ovary is bluntly five-angled. The perfect flowers are bell-shaped, the lobes standing erect.

There are five stamens and an oblong ovary. The ripe fruit, which is produced at all seasons of the year, varies in color from yellow to orange. The outer rind is thick and tough while the inner portion is fleshy and edible. Imbedded in the pulp surrounding the central cavity are hundreds of small black pitted seeds possessing similar constituents and a similar taste to black mustard seed. The trees bearing pistillate flowers only, produce rotund fruits having the general appearance of our common field pumpkin; the trees bearing perfect flowers develop oblong fruits resembling the ordinary squash; while the trees developing staminate flowers only, never produce fruits. Often great loss of money and time is incurred when a large percentage of the trees planted in an orchard develop staminate (male) flowers. There is, therefore, a great deal of uncertainty con-

Papaw (*Carica Papaya*).

nected with the papain industry at the present time. The papaw trees are planted first for the production of the ripe fruit which is an important article of food and is used by all classes in a variety of ways. During the past winter papaw was obtainable even from the small fruit dealers. They are grown secondly for the purpose of producing papain. The well-developed green fruits are cut or scraped in order to sever the latex tubes, from which flow the milky juice which is collected and prepared for market either by drying or by dissolving the juice in water, filtering, and finally precipitating by alcohol, and drying. Papain of commerce occurs usually in the form of irregular pitted fragments of variable size. The pieces are so brittle that they are readily crushed between the thumb and finger. Papain has an acrid, soapy taste, and if left on the tongue for a few minutes will produce a stinging sensation, and the

part of the tongue in contact with the papain afterwards becomes extremely sensitive to touch. This is doubtless due to the action of the papain on the outer layer of the tongue. The color of papain varies according to the method of production, from nearly white to blackish brown. White papain is nearly odorless, while the brown commercial variety has an odor resembling dried smoked beef. All samples of whole papain become lighter when powdered. Viewed under the microscope papain is structureless, yet all the fragments are

Staminate Flowers, Pistillate Flowers and a Cross Section of the young Fruit of *Carica Papaya*.

irregular and they appear to be made up of small white and black circles or dots, which give the powder a characteristic microscopic appearance. The quality or digestive efficiency of papain, which is active in the presence of the acid secretions of the stomach or in the presence of the alkaline secretions of the intestines, is usually determined by its action on fresh egg albumen, or on meat fibrin, one part of papain converting about two hundred parts of fresh egg albumen or fibrin into peptones and *albumoses*. Different samples of pure papain vary in digestive activity, this variation is due primarily to the variation of the

Microscopic Appearance of True Papain.

Microscopic Appearance of Rice Bread
Papain.Microscopic Appearance of a Spurious Papain
composed of Papain, Rice Bread and
Wheat Bread.

maturity of the fruit at the time when it is incised, the method of collection, the type of tree, and its subsequent purification.

People looking about for ways and means for reducing the high cost of living have overlooked papain. A round steak treated with a solution of papain for an hour or so before cooking becomes as tender and palatable as the best tenderloin.

Papain is too valuable a drug to be discredited and forced into disuse merely because of an insatiable desire for profits. During the past few years it has been a common practice to adulterate papain. This practice has become so preva-

True Papain.

Spurious Papain.

lent that many of the foreign buying samples which are submitted for examination are wholly spurious and are quoted at a higher price than the genuine article. The adulteration of papain was cleverly conceived, and is so cunningly executed that often it requires an expert to distinguish any physical difference between the spurious and the genuine drug. It is supposed that pure papain is whiter than the impure variety. The fact is, its color is no criterion of its strength and purity. Pure papain, if prepared by one process, may be white, while if prepared by another may be brown. This general idea that whiteness means purity may account for the fact that European exporters invariably demand a higher price for the white spurious papain. Many of the spurious samples proved upon

microscopical examination to be composed of unleavened rice bread. A careful search of a number of samples revealed the presence of several pieces of the outer smooth part of the bread, which had been in contact with the baking pan. Other samples contained a mixture of unleavened wheat and rice bread. These spurious samples varied quite as much in color as the pure papain. In some cases the bread had been scorched in order to make it more closely resemble the darker commercial variety, while other samples were grayish-white and resembled the whiter papain of commerce. Still other samples examined showed that the rice bread had been saturated with papain and dried. Selling rice bread for papain yields large profits. Rice bread costs about eight cents per pound. (No yeast or salt is used in its preparation.) This same eight-cent bread when sold as papain brings over two dollars per pound, thus netting a profit to the adulterator of about 2400 per cent. Schemes for extracting gold from sea water, or selling gold bricks are christian acts compared to the getting-rich-quick, and the safe (to date) practice of selling rice-bread for papain.

The surest and the quickest way to put a stop to the present practice of adulterating papain is to make the drug official.

THE TESTING OF LINSEED OIL FOR GLOSS OIL.

AZOR THURSTON, GRAND RAPIDS, OHIO.

In the examination of linseed oil the writer has found some difficulty in detecting "gloss oil," prepared from rosin, even if present in considerable quantity, by employing the pharmaceutical test, that is the Liebermann-Storh reaction.

Although Lewkowitsch¹ and Spayd² give directions for applying the above test somewhat different than found in the U. S. P. the modified method does not give satisfactory results in case of gloss oil.

Spayd's² modification is as follows: "by taking 2 cc. of the suspected oil and boiling with 10 cc. of acetic anhydride, adding about 10 cc. of water and allowing to thoroughly cool; then drawing off the aqueous portion, filtering through a wet filter and cautiously adding a drop of concentrated sulphuric acid to the clear filtrate. If the rosin or rosin oils to the amount of 0.5 percent. to 1 percent. are present a beautiful fugitive color will be produced.

The objections to the old method, that is the one of slightly warming with glacial acetic acid and adding a drop of strong sulphuric acid to the clear portion, are: First, nine times out of ten, the acid is not clear. Second, in a number of experiments that I made using other oils such as cottonseed, tongue, lard and linseed, I found they gave color reactions hindering the fugitive development to such an extent that one could not definitely say whether resin or resin oils were present or not. By using the modification, I was able to positively detect as low as 2 percent. of resin or resin oils in a mineral oil mixture, and as low as 3 or 4 percent. in linseed oil."

¹Lewkowitsch Oils, Fats and Waxes, page 384.

²Chemical Engineer, Vol. 3, page 224.

Even when gloss oil is present up to fifty percent. the above reaction is negligible.

The simple test of adding nitric acid to the suspected oil furnishes a more positive index of purity. In applying acid, four or five drops of the oil should be dropped into the cavity of a porcelain plate and one drop of concentrated nitric acid allowed to run down the side of the cavity without agitation. This test was applied to gloss oil also to 5, 10, 25, and 50 percent. gloss oil and the balance linseed oil.

Gloss oil will give a fugitive violet-red,³ tint 2, changing to a red-violet tint 2.

Fifty percent. gloss oil with 50 percent. linseed oil, the color produced is as pronounced as in pure gloss oil.

With 25 percent gloss oil and 75 percent linseed oil the color is green-yellow, medium, after standing four or five seconds. Permanent for some time.

With mixtures of 10 percent. gloss oil and 90 percent. linseed oil and 5 percent. gloss oil and 95 percent. linseed oil the color produced with concentrated nitric acid is yellow, tint 2. Color not fully developed until after several seconds.

The U. S. P. saponification test for rosin products in linseed oil is too indefinite in case of adulteration with small quantities of rosin products which are more or less saponifiable.

It appears it would be desirable to have an official quantitative method for determining mineral oil in linseed oil. Allen's⁴ method of saponification and extraction with ether appears practicable.

Linseed oil, mineral oil and rosin products, in many cases have so near the same specific gravity and refractive index that these constants are of no value in the detection of mixtures of the above oils.

THE RELATION OF PHARMACOGNOSY TO THE PRACTICE OF PHARMACY.

HEBER W. YOUNGKEN, A. M., PH. G., PHILADELPHIA.

How often students and practitioners of pharmacy ask the question, "What bearing does pharmacognosy have upon the general drug business?" How often do they sneeringly remark, "Why should I study the methods of cultivating, collecting, preserving, and valuing crude drugs!" It is the writer's object to point out that pharmacognosy considered as a major division of the science of pharmacology does have an important bearing upon the Practice of Pharmacy.

To Professor Alexander Tschirch, of Bern, Switzerland, is due much of the credit for developing pharmacognosy into a distinct science. Tschirch calls attention to the great departments and sub-divisions into which pharmacognosy may be divided, namely pharmacobotany,—including pharmacochemistry, pharmacophysiology, and pharmacoagriculture,—pharmacochemistry, pharmacogeography, pharmacoethnography, and the history of pharmacognosy.

³See Color Standards—Mulliken's Identification of Pure Organic Compounds.

⁴Commercial Organic Analysis, Vol. 11, Part 1, page 112.

Thus the science of pharmacognosy encompasses a wide range of related subjects. Taking up its scope we find pharmacobotany dealing with the inquiry into medicinal plants and their products. Pharmacoanatomy inquires into the structure or form of plants, their organs, tissues, and cells. Through its study we learn how to ascertain the identity and purity of drugs both macroscopically and microscopically. Pharmacophysiology is that department of pharmacobotany which treats of the life processes of medicinal plants. Through its study we learn how to cultivate medicinal plants with a view to increasing their active principle content. No less important a department of pharmacobotany is pharmacoaiculture, dealing with the effects of soil, climate conditions, hybridizing, grafting and budding upon medicinal plants, a comparatively new field of endeavor, which, though but little exploited, promises a future of wondrous revelation, potent in its significance to the profession.

Pharmacochemistry deals with the constituents of plants of medicinal value. In the pursuance of pharmacochemistry we isolate and estimate the active principles of drugs. We value many drugs accordingly.

Pharmacogeography treats of the distribution of medicinal plants over the surface of the earth. By inquiring into the environment of drug plants in their native habitats, valuable information may be gained regarding proper methods of cultivation.

Pharmacoethnography deals with the descriptive characteristics of medicinal plants and their parts. The study of this branch enables us to identify and select crude drugs.

The history of pharmacognosy inquires into the facts and events occurring in the domain of the science since its beginning.

After viewing the vast extent of ground covered by this branch of pharmacologic science, it is evidently impossible for an individual to practice with thoroughness all the arts upon which it depends. A general division would be, pharmacophysiology, pharmacochemistry, pharmacodynamics, pharmacotherapeutics and pharmacy, each providing its own specialty. However, workers in any department of a science should have a thorough knowledge of the basic principles underlying the whole structure.

The profession of pharmacy has arrived at a critical period in its history. Its future depends upon the adoption of straightforward methods by its membership. The vocation will not survive as a profession if pharmacists refuse to realize their duty in conducting their own particular branch of the work.

What then is "The relation of pharmacognosy to the practice of pharmacy?" In the light of the above facts regarding pharmacognosy as a branch of the science of *materia medica*, the practice of pharmacy is absolutely dependent upon pharmacognosy. The pharmacist must be prepared for the identification, estimation and selection of drugs, that he may be fitted to practice pharmacy, or the art of preparing, preserving, compounding and dispensing of drugs and medicines.

DEPARTMENT OF BOTANY AND PHARMACOGNOSY, MEDICO-CHIRURGICAL COLLEGE, Philadelphia.

THE PREPARATION OF AUTOGENOUS VACCINES BY THE RETAIL PHARMACIST.

JACOB DINER, PH. G., M. D., PROFESSOR OF PHARMACY AND PHARMACEUTICAL CHEMISTRY, FORDHAM UNIVERSITY SCHOOL OF PHARMACY.

The advances in pathology and bacteriology during the past 20 years have to some extent revolutionized the art and science of medicine. The recognition of the bacterial origin of many diseases and the careful study of histo-pathological and physiologic-pathological changes wrought by these specific microorganisms and the products of their activity, the toxins, has naturally led the thinking practitioner of medicine from the purely empirical employment of drugs to the adoption of such remedial agents which appear to be "physiologically" indicated. "The physicians first and principal duty is to cure disease and to alleviate suffering." In this endeavor he has from time immemorial studied, experimented and tried, only too often to find disappointment instead of success crowning his work.

I shall not attempt to enter here into the whys and wherefores, the advantages and disadvantages of vaccine therapy. We are confronted with the fact that vaccines, autogenous and heterogenous, are coming more into use, displacing and replacing much of the old time prescription work. It therefore behooves the pharmacist to either fall in line with the procession and supply the legitimate demand for vaccines or see his business dwindle day by day, part, the part that never belonged to him, going to the department stores and corporation drug stores, the other part, professionally and legitimately his, going to the "manufacturing chemists," who were enterprising enough to recognize early the trend toward vaccine therapy and to meet or even anticipate this demand. "But," I hear the pharmacist say, "it takes a good deal of money and considerable experience to start a vaccine laboratory, and I have neither." Now, if you thought that a new \$2000 soda water apparatus would add to the profits of your business and you had neither the money nor the experience to run one, what would you do? I suppose you would borrow the money and hire an experienced soda man to run it. The same principle applied to your vaccine laboratory will work out just as well. To begin with, many things needed in a laboratory should be found in every well regulated pharmacy. For the balance of the equipment about \$500 judiciously distributed will complete your outfit. As to the man, there are any number of young physicians, recently graduated, having a good hospital training in bacteriological work, who would be only too glad to spend part of their time in a well equipped laboratory for a moderate compensation. And a little study on your part during some of the time devoted to stock quotations, to racing charts and to base-ball scores, will soon enable you to grasp the fundamental principles of this, relatively new, branch of therapeutics and ere long you will be interested enough to want to know more about it.

Historical.—Vaccines as therapeutic agents are by no means new. It is only the recognition of its rationale that is new.

From time immemorial attempts have been made to cure disease by the causative agent of that disease. "A hair of the dog is good for the bite" is an old saw. Pliny suggests that the natural immunity of the Psylli against snake venom is probably due to their habit of drinking water from wells inhabited by venomous snakes. Other tribes were in the habit of producing what we now would call "actively acquired immunity" by cutaneous applications of small doses of snake venom. And a most drastic example of vaccination as a prophylactic measure is of course Jenner's application of cow virus against smallpox.

It may be of some little interest to follow up the history of smallpox vaccination for some time before Jenner's discovery, or rather rediscovery.

Arabian physicians were acquainted with the nature and treatment of smallpox. They probably were the first to whom it occurred to produce the disease by inoculation. Avicenna, of Bokhara, is credited with the discovery. It was carried by the Tartars and Chinese to Surat, Bengal and China.

Circassia: Dr. De la Motraye saw the operation of vaccination performed on a girl in 1711.

Constantinople: Dr. Kennedy reports seeing it done in 1715.

Dr. Timoni also saw it there in 1715, and Dr. Pylarini in 1716.

Cassem Aga, Ambassador in England from Tripoli, describes it in 1728.

India: Howell describes inoculation against smallpox in 1767. In Hindostan inoculation was performed by a particular tribe of Brahmins, who were delegated annually for this service.

China: D'Enrecolles speaks of it as being practiced there in 1718, but meeting with a good deal of opposition.

France: Dr. Boyer mentions it under the year 1717.

Spain: Here it was introduced in 1729, but not practiced until 1772, when it was used by Dr. Miguel Gorman.

Italy: According to Monsieur de la Condamine inoculation had been secretly practiced by the people of Naples from time immemorial. During the outbreak in Rome, in 1754, inoculation was publicly introduced by Peverini.

Germany and Austria: Inoculation was first performed in Hannover in 1724. Mr. Maitland operated on H. R. H. Prince Frederick and afterward on eight children of a Baron.

Holland: Inoculation introduced by Dr. Tronchin, who first operated on one of his own sons.

Denmark, Sweden and Switzerland: Inoculation is mentioned in the years 1754, 1754, 1751, respectively.

Russia: Operation performed in 1768 by Dimsdale.

America: In 1721 Dr. Zabdiel Boylston inoculated 244 people.

Scotland: In 1726 operation performed by Mr. Maitland.

Ireland: In 1723 first operation performed at Dublin by Dr. Bryan Robinson.

England: In 1717, yielding to the persuasion of Lady Mary Wortly Montagu, the operation was performed by Mr. Maitland on an old Greek woman.

Jenner's attention was first attracted to inoculation in 1776. Nothing further

was heard of this until 1788. His first paper on the subject appeared in 1797. In 1796 the first successful vaccination was performed by Jenner on James Phillip.

Rationale of Vaccine Therapy.—The rationale of vaccine therapy briefly stated is this: When the pathogenic microorganisms invade the animal system there ensues a war between invader and invaded. The body mechanism endeavors to ward off the attack first by “non-specific” agents of defense, that is agents opposed alike to *all* pathogenic bacterial infections, and secondly by the production of *specific* agents of defense—that is—agents directed against that particular species of microorganism which is the individual disturbing factor at that particular time. As this is not to be a treatise on the specific action of vaccines, but rather a description of the methods of preparation of such vaccines, I will content myself by stating that these *specific* agents of defense are called antibodies, immune bodies, etc. Now, broadly speaking, according to whether these antibodies are present in sufficient numbers to overcome the invading disease-producing bacteria or not the patient will either recover or succumb. Let me impress this point: Nature *always* produces *some* antibodies in every bacterial infection—it is merely a question of producing *enough*. By the introduction of vaccine into the peripheral tissues these are stimulated to produce the *specific* antibodies and send them to the aid of the antibodies already being produced at the seat of lesion—in a case of existing infection—or, when used as a prophylactic measure, such as vaccination against smallpox or typhoid fever, we stimulate the tissues by carefully measured doses of the bacterial toxin to the production of *specific* antibodies, which, stored within the animal body, are ready, for a greater or lesser period of time after vaccination, to meet that particular invading enemy and destroy him—or rather—make the animal non-susceptible to the action of that particular microorganism or its toxin. This then, in brief, is the principle of vaccination; an artificially but actively acquired immunity against a specific microorganism or its toxin.

Classification of Vaccines.—Having given a brief outline of the history and rationale of vaccine therapy, we will next consider the classification of vaccines. Vaccines are divided into two great classes: The heterogenous and the autogenous vaccines. In the heterogenous the bacteria used for the preparation of the vaccine are obtained from outside of the body of the patient—that is—some other animal, of the same or different species, is the source of supply and the vaccine is made in advance of the arising need and held ready for therapeutic or prophylactic use—stock vaccines. In the case of the autogenous vaccines the microorganism is recovered from the patient, either from some accessible focus of infection or from the circulating blood, and is then used for the preparation of the vaccine for that particular patient, so that the very same strain of bacteria which causes the disease is used for the making of the vaccine to combat that disease.

Obtaining the Specimen.—When we consider that (1) the skin and mucous membranes are always the seat of numerous microorganisms, and (2) frequently pathological lesions are due to a mixed infection, it becomes at once apparent that the obtaining and isolating of the causative microorganism is of prime importance. I shall therefore mention a few fundamental rules whose observance

in taking the specimen for the making of autogenous vaccines are the "sine qua non" of vaccine making.

1. Take the specimen yourself or have a well trained assistant from your laboratory attend to that. Many physicians, with the best intentions in the world, will fail in the observance of what, to them, seems a minor detail, with the result of contamination of specimen.

2. Observe the highest degree of asepsis in all your work—prepare as carefully for the taking of the specimen as the most careful surgeon prepares for a major operation.

3. Do not use an antiseptic on the skin or over the surface of the lesion from which you are about to gather your material—in the case of a surface infection, such as acne, carbuncle, etc., but wash the place with plenty of sterile water and gather your material from the depth of the lesion.

4. If a blood culture is to be made cut down on the vein, after the dry skin has been painted with tincture of iodine, and give yourself a liberal field to work in.

5. Do not fail in all cases to make a few primary smears, on clean glass slides or cover glasses direct from the lesion.

6. Having obtained your specimen do not delay any longer than absolutely necessary in preparing the vaccine.

After collecting the specimen and staining the primary smear, determine whether the infection is caused by a single species or whether it is a mixed infection. Even though the primary smear shows the presence of only one species a plate culture should always be made. In the case of mixed infection the numerical relation of the various microorganisms should be ascertained.

Having obtained the offending microorganism or microorganisms in pure culture the actual preparation of the vaccine begins.

Utensils Needed.—A good surgeon always lays out every instrument which may be required in the course of the operation and prepares for any emergency which might arise. We, too, will proceed to collect all the paraphernalia needed for the making of our vaccine. Hence the following articles should be on hand:

1. Twenty-four-hour pure culture of the microorganisms.
2. Sterile agar slants (two).
3. Sterile pipettes, graduated 10 cc.; 5 cc.; 1 cc. (six each).
4. Normal salt solution in 250 cc. flasks (two).
5. Sterile test tubes (6x $\frac{5}{8}$) thick walled, soft glass (six).
6. Water bath held at 60° C. and water bath for melting agar.
7. Blast lamp.
8. Special Bunsen burner with "sparflamme."
9. Glass knife, spool of adhesive plaster 1", Tr. Iodine 25 cc.
10. Sterile capillary pipettes in glass tube.
11. Watch crystals (6).
12. Glass dish with 0.25 percent Lysol.
13. Sheet lead with wire attached.
14. Green soap, cotton, alcohol.
15. Smearing slides (6), plain slides (6).
16. Wright stain, glass pencil, staining rack, distilled water.

17. Tubes of 1 percent Dextrose agar (2).
18. Sterile vaccine bottles, plugged and capped with paper (6).
19. Rubber caps for same.
20. Small casserole, small funnel.
21. Trikresol 25 cc.
22. Pair of heavy forceps.
23. Melted paraffin.
24. Counting eye piece, microscope, immersion oil, etc.

How to Make Some of These Things.—Capillary pipettes: Take a piece of No. 4 glass tubing about 5" long; heat the centre over the blast flame to redness, wait till it cools off a little, then with slight rotary motion pull the two ends apart, and cut in the middle. This will give two pipettes.

Smearing slides: Take an ordinary glass slide, mark with glass knife on one edge and break off along line.

Counting eye-piece: Take the eye-piece of your microscope, unscrew top lense, cut out a round piece of cardboard to fit inside of eye-piece; in this cardboard cut out a square piece, and lay two hairs across this square opening. These may be fastened with a drop of balsam.

Making the Vaccine.—Everything needed being on hand, we proceed with the making of the vaccine.

1. Put about 5 cc. of sterile normal salt solution into a sterile test tube ($6 \times \frac{5}{8}$).
2. Start water bath to be held at 60° C.
3. Make a thick emulsion of the microorganism to be used in the salt sol. (step 1), rubbing small quantities against the sides of the tube until thoroughly emulsified before mixing with the main bulk of the salt solution in the tube.
4. Hermetically seal this tube of emulsion in the blast flame.
5. After cooling, shake the emulsion vigorously for at least 15 minutes.
6. Cut and break off the end of the sealed tube over 0.25 percent Lysol sol.
7. With a sterile capillary pipette enter the tube and withdraw a small quantity of the emulsion and deposit it on a watch crystal.
8. Put the capillary tube in Lysol sol.
9. Cover the watch crystal with another watch crystal, to prevent evaporation.
10. Reseal the tube containing the emulsion.
11. When cool, wrap the tube in sheet lead to which a wire has been attached, and sink in the water bath held at 60° C. Keep there for 1 hour.
12. Put 1 or 2 cc. NaCl sol. in another watch crystal.
13. Mark 5 capillary pipettes about 1 inch from the small end and fit with rubber nipple.
14. Prick cleansed finger tip and allow a small drop of blood to accumulate.
15. With a marked capillary pipette suck up 1 unit (up to mark), admit a bubble of air.
16. In same pipette suck up one unit of salt sol., admit a bubble of air.
17. Suck up, in same pipette, one unit of emulsion from watch crystal.
18. Mix these on a clean slide by alternately sucking up and expelling, avoiding air bubbles.

19. Deposit a drop of this mixture on 2 clean glass slides and smear with smearing slide, same as ordinary blood smear.

20. Repeat 15, 16, 17, using 2 units of salt sol. instead of 1, and proceed as in 18 and 19.

21. When dry, stain these films, marked for identification, with Wright's stain.

22. Limit the ocular field by cross hair preparation (counting eye-piece).

23. Examine stained smears by high power, and if satisfactory—

24. Examine under oil immersion.

25. Count the bacteria and the red corpuscles in successive fields until 500 red blood cells have been counted.

26. Determine the number of bacteria per cc. by the following equation:
R. B. C. : Bacteria :: 5000 million : X.

27. Decide upon the dose per cc. and the total quantity of vaccine to be supplied, and from this determine the quantity of undiluted emulsion to be put into the dispensing bottle (vaccine bottle).

28. After the one hour has elapsed (step 11), cut tube and pipette off the quantity desired, which put into dispensing bottle.

29. With a sterile pipette remove about 1/10 cc. of emulsion, which put into a tube of melted dextrose agar, held at about 45° C. Make a shake culture.

30. Re-seal tube.

31. Add the necessary quantity sterile salt sol. to the emulsion in the dispensing bottle, thoroughly mix.

32. Remove about 1/10 cc. from bottle and put into melted dextrose agar (29).

33. Mark tube step 29 "emulsion," and tube step 32 "bottle."

34. Put into the completed vaccine 0.25 percent trikresol.

35. Put sterile rubber cap on dispensing bottle.

36. Paraffin and label.

This, gentlemen, completes the making of the vaccine, excepting the delivering and collecting of fee.

Again I want to impress upon you the necessity of extreme cleanliness and the need of using nothing but sterile appliances. Furthermore, the vaccine should not be released until 24 hours incubation of the tubes (steps 29 and 32) prove the absence of living micro-organisms.

I trust that I have succeeded in demonstrating to you that the making of autogenous vaccines is not as difficult a proposition as would appear at first glance and that the average pharmacist, with a little training, can prepare these vaccines successfully to the benefit of the patient, the satisfaction of the physician, the enrichment of himself and the credit of his profession.

THE MANUFACTURE AND ASSAY OF HYPOPHOSPHOROUS ACID.

E. E. WYCKOFF, NEW YORK.

This acid was introduced into the United States Pharmacopoeia of 1890, and retained in the eighth revision, largely because of its value as a preservative of pharmaceutical preparations containing iodides, which are liable to decomposition by exposure to light and air.

It does not require a very long memory to recall the difficulties experienced in keeping these preparations, and the losses sustained by pharmacists as a result of failure to prevent oxidation or decomposition.

In 1888, Mr. John Devine conducted a series of experiments to determine the value of hypophosphorous acid as a reducing agent in the preservation of ferrous compounds, and the minimum quantity required for the purpose.

He embodied the results of his work in a paper read before this Section at the 1889 meeting.

Its use for this purpose met with more or less objection at that time, but now has official sanction.

Various processes have been suggested for the preparation of hypophosphorous acid, but it seems that purity of product did not receive much consideration, if one may judge by the results obtained by some, if not most, of the methods given.

As is often the case, the most direct method, and the best from the standpoint of product obtained, is not the one which lends itself most readily to easy and speedy manipulation; the method referred to is that by which barium hypophosphite is prepared by boiling a solution of barium hydroxide with phosphorus and afterward decomposing the barium hypophosphite with the exact equivalent of sulphuric acid. The method is direct, the by-products few and easily eliminated, and with a reasonable amount of care, the product is of a high degree of purity. But prolonged boiling is required, the method is slow and tedious and, because of limited solubility of barium hydroxide, a large volume of water is required in proportion to the amount of final product. This method is suitable only for operations on a rather large scale.

Another method given in the Dispensatories, and also mentioned in several standard works on chemistry, is the decomposition of calcium hypophosphite, in solution, by means of oxalic acid, and the equation illustrating the reaction is usually given:

This is a good example of a large class of equations which do not tell the whole truth; it works out to a nicety on paper and to all appearances it is only necessary to filter out the calcium oxalate and have hypophosphorous acid.

Here is where the utility of the U. S. P. ammonia test is shown: neutralize a portion of the acid, made in this way, with ammonia, and a precipitate appears at once.

Calcium oxalate is insoluble in water but is soluble to a considerable extent in hypophosphorous acid, consequently the product in this case is hypophosphorous acid saturated with calcium oxalate.

This was pointed out in 1887 by Mr. George Lunau (*Phar. Jour. and Trans.*, Mch 19, 1887), and in view of the poisonous character of the impurity the method should have been abandoned long ago, and mention of it either dropped from chemical text books or attention directed to the true character of the products of the reaction.

In the first issue of the National Formulary in 1888 a formula is given for the preparation of hypophosphorous acid by decomposing potassium hypophos-

phite with tartaric acid in presence of dilute alcohol and water and the formula was retained in the second and third editions.

This process is less objectionable than that in which oxalic acid is used because the impurity is not poisonous, but the product is very impure nevertheless, and there is an additional objection because of the expense due to alcohol lost in the operation.

In the American Journal of Pharmacy (Dec., 1908, p. 583), Dr. Gunnar Heikel proposes a method by which calcium hypophosphite in solution is decomposed by a solution of ammonium oxalate; the products of the reaction being calcium oxalate, precipitated, and ammonium hypophosphite in solution in which the calcium oxalate is completely insoluble. After filtering, the solution is boiled with barium carbonate until decomposition is complete, as shown by the absence of ammonia in the vapor.

In an experiment after this method carried out by the writer, boiling was continued for twenty hours, and at the end of that time ammonia was still being given off in appreciable volume.

Bearing in mind that the hydroxides of the alkalies and alkaline earths readily displace ammonia, a trial of barium hydroxide was made and the result was very satisfactory. On adding $\text{Ba}(\text{OH})_2$ to a cold solution of ammonium hypophosphite, elimination of ammonia begins within a few minutes, and on warming, the reaction is accelerated and about two hours' heating on a steam or boiling water bath is sufficient to expel all the ammonia, and a solution of barium hypophosphite with some insoluble residue, remains.

This is to be filtered, and filter and residue washed with hot water until a small portion of the washings gives little or no precipitate on the addition of a few drops of dilute sulphuric acid.

The formula in detail is as follows:

Calcium Hypophosphite	350 Gm.
Water	2000 Cc.
Oxalic Acid	190 Gm.
Strong Ammonia Water.....	qs.
Barium Hydroxide	630 Gm.

Dissolve the calcium salt in the water by gentle heat and, while hot, add the oxalic acid. Stir a few minutes, then remove from heat and add strong ammonia water until in slight excess. Allow to stand until cold, then test a portion of the clear liquid by adding a little oxalic acid; if this causes a precipitate, more oxalic acid must be added to the solution until no further precipitate is produced, keeping the solution alkaline by the further addition of ammonia if necessary. Now filter and wash the residue with hot water. To the mixed filtrate and washings add the barium hydroxide and heat on a steam or water bath, with frequent stirring, until free from ammonia, at the same time allowing the solution to become concentrated by evaporation.

The mixture must not be allowed to evaporate to dryness, however, as that would cause decomposition with the production of the highly poisonous phosphine gas.

When free from ammonia, which may be ascertained by holding a strip of moistened red litmus paper in the ascending vapor, filter and wash the residue

with hot water. Mix the filtrate and washings and weigh, then determine accurately the percentage of barium in the solution. From this calculate the weight of standardized dilute sulphuric acid required to exactly decompose the barium compound.

Mix, heat on steam or water bath until the volume is reduced at least one-half, then allow to cool and filter. The product should be entirely free from barium and give only a faint test for sulphuric acid.

As a matter of interest, some experiments were carried out using barium dioxide to decompose the ammonium hypophosphite.

Adding the barium dioxide to a warm and fairly concentrated solution of the ammonium salt, vigorous reaction set in at once, accompanied by brisk effervescence, the development of considerable heat and the rapid elimination of ammonia.

After standing until the reaction had somewhat abated, the mixture required but a short period of heating on a steam bath to complete the decomposition.

Considering the character of the constituents of this reaction, one would expect that a portion of the hypophosphite would be oxidized to phosphate; on filtering the mixture, washing the residue, dissolving a portion in nitric acid and applying the molybdate test, a heavy yellow precipitate of ammonium phosphomolybdate was produced.

The barium dioxide was tested in the same way and shown to be free from phosphate.

No phosphate was found in the filtrate, but that was scarcely to be expected in view of the alkaline condition of the solution.

The assay of hypophosphorous acid is best conducted by the method worked out in this laboratory by Mr. Horace North and published in the American Journal of Pharmacy for April, page 147.

Put 1 cc. hypophosphorous acid in a tared, stoppered Erlenmeyer flask and weigh accurately.

Add 20 cc. of water recently boiled, to expel CO_2 , and a few drops of phenolphthalein solution. Titrate with $\text{N}/5 \text{ Ba}(\text{OH})_2 \text{ V.S.}$ (standardized against $\text{N}/5 \text{ HCl V.S.}$) until a permanent pink color is produced, and calculate the weight of absolute acid.

Put the flask in a water oven for one hour, then collect any precipitate that may have formed on a 7 cm. Swedish filter, washing with hot water until the filtrate no longer yields a turbidity with a few drops of dilute sulphuric acid, and ignite the filter in a platinum crucible. Deduct the ash of the filter from the residue and divide the corrected weight, in milligrams, by the weight, in grams, of absolute acid in the quantity taken.

The quotient is the barium number and it indicates the proportion of sulphuric, phosphoric or other acids whose barium salts are insoluble under the conditions of the test. If an estimate of the sulphuric acid alone is required, the residue may be treated with hydrochloric acid, washed, ignited and weighed.

In a product fit for medicinal use, the barium number should not exceed 5.

The product may now be concentrated to 50 percent or diluted to 10 percent as required.

Papers Presented at the Sixty-First Annual Convention

BICHLORIDE TABLETS OF THE GERMAN PHARMACOPOEIA.

OTTO RAUBENHEIMER, PH. G., BROOKLYN, N. Y.

Mercury, that is the metal, was already known in the time of the great Greek philosopher, Aristotle (384-322 B. C.), and held the highest place in the mediæval literature. Native mercury was found in the mines of Spain in liquid form and was therefore called *Argentum Vivum*, that is, living silver, or quicksilver. Chemistry, medicine and pharmacy are indebted to the Arabian alchemist, Abu-Musa-Dschafir-Ali-Sofi, commonly called Geber, which is the equivalent of his middle name, who discovered bichloride of mercury about the year 800. This he prepared by the sublimation of mercury, iron vitriol, alum, salt and saltpeter. The German chemist, Johann Kunkel, in 1716 greatly improved this process, which is still in use today, by subliming a mixture of mercuric sulphate and sodium chloride. It was Sir Humphry Davy, in 1810, who determined the chemical composition of corrosive sublimate as mercuric chloride. It is an everlasting credit to Paracelsus (1493-1541), the founder of iatro-chemistry or medical chemistry, to have introduced the mercurials into medicine as a specific against syphilis. Corrosive sublimate became a recognized cure for syphilis at the Vienna School of Medicine. It was there introduced by the celebrated Gerard van Swieten (1700-1772), the Dutch physician and pupil of the immortal Boerhaave. Van Swieten's solution of corrosive sublimate still holds its place in medicine and pharmacy.

The chemical and pharmaceutical industry in the United States most certainly deserves credit for the introduction as well as the evolution of tablet manufacture. Dr. Charles Meigs Wilson, of Philadelphia, in 1884 was the first to suggest the use of tablets of corrosive sublimate, which most decidedly have a great advantage in the extemporaneous preparation of solutions. The tablets suggested by him contain 7.7 grains of corrosive sublimate and 7.3 grains of ammonium chloride, each of which when added to a pint of water will make a solution of 1 in 1000. The addition of ammonium chloride serves three purposes, namely, it prevents the decomposition of the mercuric chloride, it hastens its solubility and produces a permanent solution. Since then these tablets have come into tremendous use.

In 1887, Dr. Angerer, professor of surgery at the University of Munich, and physician to the Bavarian court, recommended tablets composed of equal parts

of mercury bichloride and sodium chloride. These were introduced into the German Pharmacopoeia under the title

"*Pastilli Hydrargyri Bichlorati*" or "*Sublimatpastillen*."

The following is a translation of the monograph of the 5th edition of the German Pharmacopoeia, 1910:

Content about 50 percent of mercuric chloride (HgCl_2 , molecular weight 270.9).

Equal parts of finely powdered mercuric chloride and sodium chloride are well triturated, the mixture is colored red with an aniline dye and is formed into tablets of a cylindrical shape, which are twice as long as thick and which should weigh either one or two grams.

Hard cylindrical pastilles of a red color, easily soluble in water but only partly soluble in alcohol and ether. The aqueous solution should not redden blue litmus paper.

Sublimate pastilles must be dispensed in well closed glass bottles, which must bear a poison label. Each tablet must be wrapped separately with black paper, which in white ink must bear the word "Poison," as well as the amount of corrosive sublimate.

Must be kept preserved from light and moisture.

Must be kept in the poison closet under lock and key.

The fifth edition of the *Deutsche Arzneibuch*, 1910, also contains an assay for the determination of the mercuric chloride in these pastilles. It is the method of Professor E. Rupp, which was first described in *Archiv de Pharmazie*, Vol. 244, page 536. In this elegant method the corrosive sublimate by means of KOH and KI is changed to mercuric-potassium iodide, which with solution of formaldehyde, is reduced to metallic mercury. Diluted acetic acid is then added, as this will prevent any decomposition of tenth normal iodine volumetric solution by the excess of formaldehyde. The iodine solution dissolves the metallic mercury, forming mercuric iodide. The excess of iodine is titrated with tenth normal sodium thiosulphate volumetric solution, from which the amount of mercuric chloride is calculated. Unlike other assays, the red aniline dye Eosine does not interfere with the determination of mercuric chloride in the Rupp assay.

The object of the addition of sodium chloride to the tablet is two-fold: it increases its solubility and it furthermore neutralizes the acid reaction of mercuric chloride. A double salt is formed, namely $\text{HgCl}_2 \cdot 2\text{NaCl}$, which is neutral. For the formation of this double salt 100 parts of HgCl_2 requires 43 parts of NaCl, consequently 57 parts of NaCl are in excess.

The colorless bichloride tablets have been responsible for the great many accidents which have occurred of late in different parts of the United States. Methylene blue has been recommended and has been used for coloring these tablets and solutions. As pointed out by Thomas Wilson, in the *Pharmaceutical Journal*, 1913, page 99, abstracted in *The Practical Druggist*, May, 1913, page 39, methylene blue forms a precipitate with bichloride solutions which are stronger than 1 in 1000. Red has always been considered as a danger signal, and for that reason a red color is to be preferred to a blue or green color in a bichloride tablet, besides being more permanent. The German Pharmacopoeia does not specify the amount of the red aniline dye, but manufacturers are in the habit of using 1 gram of Eosine to 1 kilogram of the mixture.

The German Pharmacopoeia specifies a cylindrical shape, namely, twice as long as thick. This requirement was evidently for the purpose of preventing confusion between the deadly bichloride tablets and any other harmless round tablets.

The foresight of the German authorities can well be seen in the requirement that each tablet must be wrapped individually with black paper, which in white letters bears the word "Poison."

The amount of mercuric chloride must also be stated on each black wrapper with white letters, giving the number of grams contained in each tablet. This is a new requirement in the fifth edition of the German Pharmacopoeia.

The tablets must be kept in the poison closet under lock and key. They must be protected from the light, as this might in time bleach the color somewhat, and they must also be protected from moisture, as the sodium chloride in the tablets is apt to absorb same.

Bichloride tablets must be dispensed in well-closed amber bottles, which must bear a poison label. It is furthermore customary that the German apothecary caution the patient regarding the poisonous nature of these tablets and advise him to keep them under lock and key.

Last, but not least, the sale of these tablets in Germany is restricted to prescriptions only. They cannot be sold to every Tom, Dick and Harry, and this precaution undoubtedly accounts for the fact that no poisonings, accidental or suicidal, with bichloride tablets occur in Germany.

The author has procured tablets of different manufactures in different parts of Germany which are herewith submitted. The danger to the public is unquestionably largely overcome in the German bichloride tablet. No one can possibly swallow such a tablet accidentally during the day or night. The German bichloride pastilles are practically "fool proof."*

It is one of the first duties of the pharmacist to be careful in order to prevent error or to minimize the danger in dispensing poisons. Be careful! This should be the watchword of every pharmacist.

This paper, together with the specimens, may serve as an illustration of how well the German government and the German pharmacist take care of the health and safety of the public. No heterogeneous laws in different parts of the German Empire, but a pharmacopoeial standard and requirement to which every manufacturer and every pharmacist *has to live up to* and *does live up to*.

Let the German bichloride tablet serve as an illustration for our great country and its Pharmacopoeia, so that the latter may deserve the title "Peer of all Pharmacopoeias."

*The writer, however, cannot help but express his great surprise that such a standard work as *Hager's Handbook der Pharmazeutischen Praxis*, nor its supplement, has any comments to make on *Pastilli Hydrargyri Bichlorati*. Merely the formula is stated but no comparisons are made and no comments are given. Truly not a credit to this master work of pharmacy.

REPORT OF THE COMMITTEE ON RECIPE BOOK.

OTTO RAUBENHEIMER, CHAIRMAN.

Far-sighted and foresighted, Prof. Henry P. Hynson, has suggested the idea, has sown the seed, and has thus become "father" of the Recipe Book, a book of standard unofficial formulas, a book which in time will be a great value to the practicing pharmacist.

The A. Ph. A. very wisely appointed a committee of five on this Recipe Book, and perhaps not so wisely appointed the undersigned as chairman. Not because he shirks the work, but because his working days are limited to eighteen hours each and his time is pretty well occupied, it was impossible for him to do as much work on the Recipe Book as he would like to have done.

Nevertheless the work was started and was started on the right basis, as explained in our report at the Boston meeting, which is printed in the JOURNAL, Vol. 1, pages 168 and 169. Thus far, 114 formulas have been gathered at no expense whatsoever to the Association. They are published in installments in the JOURNAL of February, April, May, June, July and November, 1912. The published formulas comprise the following galenicals: medicinal baths, collyria, creams, elixirs, gauzes, glycerites, household ammonia, lotions, lubricating jellies, oils, ointments, pastes, powders, soap solutions and waters. For a number of years, your chairman has acted as a sort of a local, national and even international information bureau, being called upon daily to supply formulas for magistral, hospital and even foreign preparations. Being fortunate in having a rather complete library, I have been placed in such a position as to readily furnish this kind of information. Being aware of how hard it is to locate a formula for many lotions which are frequently prescribed by specialists, your chairman has endeavored to make a compilation of formulas of these lotions as complete as possible, being assisted in this by Dr. Binford Thorne, a former resident of Nashville, now one of Brooklyn's leading dermatologists.

Among the many formulas useful to the pharmacist behind the prescription counter, I might point out the lubricating jellies for catheters and instruments, Beck's bismuth paste, scarlet-red ointment, stainless iodine ointment, ichthyol ointment, Thiersch's powder and solution, sunburn lotions, lanolin cream and lotion, shaving lotions, etc., etc. Quite a number of these preparations have lately been marketed as proprietary or semi-proprietary preparations. From the knowledge of the composition of these preparations, and still easier from a formula for a similar or better preparation, the pharmacist can prepare these himself and offer them to the medical profession. Special care has been exercised that when any of these preparations contain an ingredient which is not well known in the United States, a formula for the same is also given. The numerous favorable comments received by the chairman give evidence that members of the A. Ph. A. are appreciating my somewhat amateur attempt of collecting suitable formulas for the Recipe Book. One pharmacist wrote that in the preparation and sale of *Lotio Delphinii*, published in the JOURNAL, Vol.

1, page 1312, he has saved several times the price of his membership dues of the A. Ph. A.

President Godding in his annual address at the Denver Convention has the following to say about the pharmaceutical formulas: "At the present time the department of pharmaceutical formulas has published one hundred recipes in the Journal of the A. Ph. A. Many are in local use. Heretofore, when needed, they were not to be found without much searching and then with varying success as to reliable directions in compounding. It seems desirable that these formulas should be the forerunner of the Recipe Book of the A. Ph. A., the publication of such a book would probably add prestige and revenue to this Association."

On May 8, 1911, the committee on the A. Ph. A. Recipe Book (see the Journal, February, 1912, page 168) presented a report to the Council as to:

1. Advisability of publication.
2. Scope and character.
3. Plans and details of publication.

It was decided that the proposed formulas should first be published in the "Department on Pharmaceutical Formulas" in the Journal. In Council Letter No. 2, of November 18, 1912 (see Journal, December, 1912, page 1462-63), favorable comments have been made by Messrs. Apple, Main and Wulling. Let us hope that the wise men in the Council will see the desirability, in fact the necessity of the publication of such a Recipe Book by the A. Ph. A. Meanwhile, let the members of the committee, together with the chairman, continue actively in the compilation of desirable formulas for the benefit of the pharmaceutical profession and especially of the members of the A. Ph. A.

AWAKE AT THE TURNS.

Alertness is not jumpiness, nor necessarily speediness; but a concentration which brings to bear all the resources of the mind upon the matter in hand. This concentration is on the first part of the proposition, not the last. That is the distinguishing mark of the alert man. He brings his attention fully and at once to the proposition. In a very few minutes his mind has grasped what is coming in all its details, and he knows whether it is worth while. The inalert man does not pay attention until something big or striking arouses his interest. Then he has lost the clew, and is muddled. Not only does such a man lose many of his best opportunities by not grasping their significance until they are by, but he is a weariness to the flesh with his everlasting, "Now go over that again, won't you?"

Alertness is not solely a gift of Heaven to quick minds. It is a habit, the exercise of sense. Many quick minds are not alert, because they are off woolgathering while they are in a cotton field. Many slow minds are alert, because from sheer force of will they concentrate promptly on the proposition before them.

If a man is ever to get to where he wants to go, he must be awake at every turn of the road.—*The Popular Magazine*.

Section on Education and Legislation

Papers Presented at the Sixty-First Annual Convention

REPORT OF THE DELEGATES TO THE NATIONAL DRUG CONFERENCE, 1913.

JOHN C. WALLACE, CHAIRMAN.

At the Boston meeting in 1911, a recommendation was made by Prof. Hynson, as Chairman of the Committee on National Legislation, that a National Conference be called under the auspices of the American Pharmaceutical Association. The recommendation met with opposition and was defeated.

At the Denver meeting in 1912, a similar recommendation was made by John C. Wallace, at that time Chairman of the Section on Education and Legislation. The recommendation met with opposition, not only in the report of the Committee on Chairman's address, but was carried to the floor of the section. Finally a substitute motion was made that the recommendation be referred to the Council and it required the vote of the presiding officer to decide the motion in the affirmative.

At a subsequent meeting of the Council, the following resolutions, offered by J. H. Beal, were adopted:

"(1) That the American Pharmaceutical Association hereby calls a conference to be made up of delegates from the various national pharmaceutical associations to consider the subject of legislation, both state and national, in its relation to pharmacy."

"(2) That the General Secretary is instructed to send invitations to each of the national pharmaceutical associations requesting the appointment of delegates to such conference."

"(3) That such conference shall be held at Washington, D. C., some time prior to January 1, 1913."

"(4) That the Temporary Chairman of the conference shall be appointed by the President of the American Pharmaceutical Association, and the General Secretary of the Association shall act as Temporary Secretary of the same."

"(5) That such conference shall elect its own permanent officers, and after its organization shall be considered as representing all of the associations sending delegates to the same, and shall not be considered as being conducted under the auspices of any particular organization."

The resolution originally provided that the meeting was to be held prior to January 1, 1913, but the time was extended by vote of the Council to February 1, 1913.

President Day appointed as delegates to the Conference, John C. Wallace, Dr. James H. Beal and Samuel L. Hilton, and designated John C. Wallace to act as temporary chairman.

The Conference met at the New Willard Hotel in Washington, D. C., at 10 a. m., January 15, 1913, with the following delegates present:

Representing the American Pharmaceutical Association:

John C. Wallace, New Castle, Pa.
S. L. Hilton, Washington, D. C.
J. H. Beal, Scio, Ohio.

Representing the National Wholesale Druggists' Association:

F. E. Holliday, New York City.
C. Mahlon Kline, Philadelphia, Pa.
E. D. Taylor, Richmond, Va.

Representing the National Association of Manufacturers of Medicinal Products:

Adolph Rosengarten, Philadelphia, Pa.
A. R. L. Dohme, Baltimore, Md.
Charles M. Woodruff, Detroit, Mich.

Representing the American Association of Pharmaceutical Chemists:

Willard P. Stearns, Chicago, Ill.
W. C. Abbott, Chicago, Ill.
R. C. Stofer, New York City.

Representing the National Association of Retail Druggists:

W. C. Anderson, Brooklyn, N. Y.
F. H. Freericks, Cincinnati, Ohio.
J. F. Finneran, Boston, Mass.

A motion was adopted authorizing the temporary officers to act until a permanent organization had been effected.

After considerable discussion the following resolutions, offered by Drs. Beal and Anderson, were adopted:

"(1) That the Chairman appoint a committee of five on Form of Organization and Nominations, and a committee of five on Resolutions, both of the said committees to report at a subsequent session of the Conference."

"(2) That until the aforesaid committees shall be ready to report, the Conference proceed to the consideration of pending national opium legislation."

"(3) That the privileges of the floor be extended to the delegates present from other medical and pharmaceutical associations interested in pharmaceutical legislation."

The Conference at once took up for consideration H. R. Bill No. 25834, known as the Harrison-Wright Anti-Narcotic Bill, as a hearing was to be had at 5 o'clock before the sub-committee of Ways and Means Committee, of which Mr. Francis Burton Harrison, member of Congress, was Chairman.

The hearing before the sub-committee of the Ways and Means Committee had previously been arranged by Dr. William C. Anderson, Chairman of the Committee on Legislation of the National Association of Retail Druggists.

At the third session of the Conference, which was held in the evening, the Committee on Form of Organization and Nominations, and the Committee on Resolutions, made reports which were adopted.

The officers elected were: President, John C. Wallace; First Vice President, Charles A. West; Second Vice President, William C. Anderson; Third Vice President, W. C. Abbott; Secretary-Treasurer, Charles M. Woodruff.

The Executive Committee were Dr. James H. Beal, C. M. Kline, James F.

Finneran, and the President and Secretary of the Conference. On motion the President of the Conference was made Chairman of the Executive Committee.

The Committee on Resolutions presented the following, which was adopted:

"The National Drug Trade Conference-in session in Washington, D. C., this fifteenth day of January, 1913, herewith submit by unanimous resolution that this Conference is heartily in favor of Federal Legislation of such a nature as to bring under control the importation and the interstate traffic in so-called habit-forming drugs in such a manner as to prevent their illegitimate use, without placing unnecessary burdens upon the manufacturer, jobber, retailer, physician, or veterinarian."

A telegram was received from the American Medical Association requesting representation through Mr. M. I. Wilbert, when the privileges of the floor were granted to him, and he proved to be a very valuable acquisition to the Conference, as he is the author of the proposition for the use of the official order blank.

At the hearing before the Committee on Ways and Means we were told that we had sinned away our days of grace and should not come in at the eleventh hour, and object to the measure, when we had had a number of years to consider it, and that several branches of the trade had already approved of it. We, however, succeeded in convincing the Committee that possibly we had some information that might be valuable to them, when Mr. Harrison and Dr. Hamilton Wright agreed to give us another hearing, when we had succeeded in drafting a measure that would meet with the approval of the Conference.

The Conference prepared a draft of a bill, which was presented to Mr. Harrison, by a special committee, it was introduced in the House by Mr. Harrison on January 20, and is known as H. R. Bill No. 28277.

The delegates having returned home and taken up the study of H. R. No. 28277, concluded that it needed still further revision. Much correspondence ensued and many changes were suggested.

On February 20 the chairman of your delegates to the Conference went to Washington in order to find out the true status of the Harrison Bill and Mr. Harrison's intentions. He learned that owing to the congested condition of affairs in Congress in relation to the appropriation bill, Mr. Harrison had concluded not to report H. R. Bill No. 28277 out at this session, but that it was his intention to present the bill immediately after the convening of the special session of Congress, and to use every effort to have it enacted. Mr. Harrison felt that a draft prepared by the Conference should be the foundation of the new Harrison Bill. The President of the Conference immediately notified each of the delegates of the conditions as he found them, and recommended that they offer such suggestions and amendments as they might have to the Conference Bill, have them submitted to a special committee or to the Executive Committee, and have the draft prepared by the committee, together with the different suggestions, submitted to the Conference, ready for its approval or correction, at a meeting which should be held early in April.

A hearty response was received from the delegates, and a meeting of the Executive Committee was called, to be held at the New Willard Hotel at 11 a. m., Wednesday, April 9, and a meeting of the Conference for April 10. Previous, however, to the meeting of the Executive Committee, Mr. Harrison introduced

H. R. Bill No. 1969, which eliminated the official order blank and required records and reports of purchases and sales.

At the meeting of the Executive Committee, all of the drafts, suggestions and amendments were taken up and considered, a new bill drafted and presented to the Conference on April 10, and the Executive Committee were directed to present to Mr. Harrison the bill as approved by the Conference.

At this time, the Committee on Tariff were caucusing behind closed doors, and the committee were unable to get in touch with Mr. Harrison, but left a draft of the same with his secretary, after explaining many of its provisions. The committee were advised that we doubtless would be able to see Mr. Harrison Monday or Tuesday of the following week, and the Chairman of the Executive Committee was directed to return to Washington on Tuesday, April 15, and go over the provisions of the bill with Mr. Harrison. On the fifteenth Mr. Harrison was still extremely busy and unable to give an audience to your representative.

This draft was subject to many suggestions and proposed amendments.

It became apparent that another conference would be necessary, when Conference Resolution No. 2 was adopted. It was as follows:

WHEREAS, Present indications are that an emergency may require immediate representation of the National Trade Conference at Washington, D. C.; therefore be it

Resolved, That President John C. Wallace be authorized to represent the Conference in such emergency and to call to his assistance such delegates to the Conference, as are within convenient traveling distance of Washington.

On May 21, Mr. Albert Plaut, of New York, and John C. Wallace had a long conference with Dr. Hamilton Wright, discussing the proposed narcotic legislation, Mr. Harrison at the time being out of the city.

Dr. Wright was very insistent that we get together and have a final conference on the bill immediately upon Mr. Harrison's return, as the government officials were very anxious that the bill should be reported out of the committee. During this conference a number of changes were agreed upon; at this time Dr. Wright waived the keeping of records of sales by retailers.

On Tuesday, May 27, the Chairman of the Executive Committee received a telegram from Mr. Harrison, asking for a conference of the special committee for Wednesday, May 28.

On Wednesday, May 28, Mr. C. M. Kline, Mr. Adolph Rosengarten, Samuel Rosengarten, Dr. Dohme and John C. Wallace met Dr. Wright and Mr. Harrison at the latter's office, and went over the drafts that had been prepared. After thorough discussion of the two drafts in Mr. Harrison's possession, he asked that we remain over with Dr. Wright and prepare a draft to be submitted at the final meeting of the committee representing the conference, and the committee representing the government, not to be later than June 9.

Samuel Rosengarten and John C. Wallace remained in Washington on Thursday and Friday; spent both days with Dr. Wright at his office and prepared another draft. This draft was sent to all the members of the Executive Committee and a meeting of this committee called for June 9, at the New Willard Hotel in Washington.

The committee met in Washington on June 9, all the members being present except Mr. Finneran, who was represented by Dr. William C. Anderson.

The bill was considered paragraph by paragraph, and after an agreement had been reached, a conference was held with the committee representing the government, at the office of the Assistant Secretary of the Treasury. This conference did not prove entirely satisfactory, as a conclusion could not be reached on two vital points. The committee reconvened, prepared a memorandum, to be attached to the bill as approved by the Conference, and a committee appointed consisting of John C. Wallace, Dr. James H. Beal and Charles M. Woodruff, to present the same to Dr. Hamilton Wright at the State Department on the following morning. After a conference of considerable length with Dr. Wright and Mr. Talbot of the Internal Revenue Department, a satisfactory agreement was reached, and the bill, H. R. No. 6282, was introduced in Congress by Mr. Harrison on June 23, referred to the Committee on Ways and Means, reported out of the committee with a favorable recommendation, and was passed, with but two slight amendments, by the House of Representatives on June 26, and presented to the Senate on June 27. There it was read twice and referred to the Committee on Finance.

John C. Wallace, while in Washington on August 1, learned that amendments had been proposed by Senator Penrose to H. R. Bill No. 6282 which, if enacted, would nullify the entire bill. After discussing the matter fully, the senator directed his secretary to advise the Chairman of the Finance Committee that he wished to withdraw the proposed amendments.

Your delegates feel that the creation of the Conference and the result of its labors have marked another epoch in the American Pharmaceutical Association.

It has not only brought all of the drug interests into the greatest harmony but it will save the trade a very large amount of money by a reduction in the license fee, these having been reduced from \$100 for wholesalers and \$25 for retailers to a flat rate of \$1 for all dealers.

Anti-narcotic legislation was the subject of special messages to Congress by President Wilson and by Secretary of State Bryan, and it seems probable that the measure will be enacted in substantially its present form at an early session of Congress.

The calling of the Conference and its work have met with the approval of all of the branches of the trade, have been commended on the floor of the House of Representatives and by the pharmaceutical press of the country. The latest of these to reach us is from the Journal of the National Association of Retail Druggists, under date of August 7, and is as follows:

"Every branch of the drug trade was represented by able men, the government itself participating in the Conference by a representative of the State Department, a representative of the Bureau of Chemistry, and by members of Congress. The result was a finished product in the form of a measure which has received general approval and which fits in with the international scheme of illicit narcotic drug suppression fathered by the The Hague Conference, in which the important governments of the world are parties of interest."

The idea of such a conference was taken up by the manufacturers and producers of food products and a National Food Trades Conference was formed at

Atlantic City last June, a full report of which appeared in the New York Journal of Commerce, on June 9.

While your delegates are free to admit that, viewed from a single or selfish standpoint, the bill might in some ways be improved, but considering the great diversity of interests represented, they feel that it is not only a credit to the various associations represented but an honor to the A. Ph. A., under whose guiding hand it was brought into existence.

The spirit of harmony which prevailed through all of the deliberations of the Conference, when the great diversity of interests is considered, is worthy of more than passing notice.

We recommend continued affiliation with the Conference.

We desire to make public acknowledgement of the many courtesies extended and the consideration received at the hands of the Hon. Francis Burton Harrison, of New York, Dr. Hamilton Wright of the State Department, and Mr. Harrison's efficient secretary.

All of which is respectfully submitted.

JOHN C. WALLACE.

J. H. BEAL.

S. L. HILTON.

PHARMACY LAWS PROPOSED, ENACTED OR AMENDED DURING 1912-1913.*

FRANK H. FREERICKS.

(Continued from January Issue)

DEFEATED PENNSYLVANIA PHARMACY BILL.

Section 1. Definitions (a) That the term pharmacy when not otherwise limited shall for all the purposes of this act of Assembly be taken to mean a retail drug store or any place other than a licensed store or licensed pharmaceutical laboratory as hereinafter defined where drugs, medicines or poisons are compounded, dispensed, prepared or sold at retail.

(b) A licensed store shall for the purposes of this act be deemed to mean a store other than a pharmacy licensed under the provisions hereof to sell drugs and poisons for medicinal use but only in original packages put up by or under the supervision of a pharmacist or a licensed pharmaceutical laboratory and properly labeled as to dose and directions for use.

(c) A licensed pharmaceutical laboratory for all the purposes of this act of Assembly shall be taken to mean a place other than a pharmacy or licensed store where drugs are compounded.

(d) That the term "drug" as used in this act of Assembly shall include all medicines and preparations recognized in the United States Pharmacopoeia the National Formulary or the American Homeopathic Pharmacopoeia for internal

*Continuation of the report of the secretary of the Section on Education and Legislation. See Journal for January, p. 67.

or external use and any other substance or mixture of substances intended to be used for the cure, mitigation or prevention of disease of either man or other animals.

(e) That the term "pharmacist" shall for all the purposes of this act of Assembly be deemed to mean a person who is properly registered and licensed in accordance with this act of Assembly to act as a pharmacist and to compound sell furnish or dispense drugs chemicals and poisons in a pharmacy or licensed pharmaceutical laboratory.

(f) That the term "assistant pharmacist" shall for all the purposes of this act of Assembly be deemed to mean a person who is properly registered and licensed in accordance with this act of Assembly to act as an assistant pharmacist and to compound sell furnish or dispense drugs chemicals and poisons in a pharmacy or a licensed pharmaceutical laboratory conducted under the supervision of a pharmacist.

The certificate of a registered assistant pharmacist shall entitle such person to all the privileges of a registered pharmacist during the temporary absence of the registered pharmacist in charge but shall not entitle such assistant pharmacist to manage or conduct a pharmacy or drug store.

Section 2. That there shall be established in the State of Pennsylvania a board to be known as "The Pennsylvania Board of Pharmacy" to consist of five persons three of whom shall constitute a quorum who shall be appointed for the term of five years by the Governor from among the most skillful pharmacists in Pennsylvania who are not teachers or instructors in any educational institution teaching pharmacy each appointee must have been registered as a pharmacist in Pennsylvania for at least ten years previous to his appointment and he must be actually engaged in conducting a pharmacy or licensed pharmaceutical laboratory at the time of his appointment Provided Whereas a State Pharmaceutical Examining Board has hertofore been created in this Commonwealth and is now instituted and organized as provided in this act of Assembly. The members of the said board heretofore created shall constitute and henceforth be deemed and taken to be the Pennsylvania Board of Pharmacy established by this act of Assembly. That the appointed members of said board heretofore created shall respectively continue to hold office as members of the board established by this act of Assembly until the expiration of the terms for which they were originally appointed. Each member of said board shall receive an annual salary of twelve hundred dollars which shall be in lieu of a per diem compensation allowed them by law and also shall receive all necessary expenses to be paid out of the State Treasury upon certificate of the secretary of said board and warrant approved by the Auditor General the same to be paid quarterly. The officers of said board shall be a president a vice president and treasurer elected from their number. They shall also elect a secretary who must be a pharmacist and who may be a member of the board and who shall discharge such duties as are hereinafter specified and such additional duties specified by the board as may be necessary for the proper enforcement of the provisions of this act of Assembly and the salary of the said secretary shall be a reasonable amount to be determined by the Pennsylvania Board of Pharmacy not to exceed the sum of three thousand (\$3,000) dollars per annum provided however that if said secretary be one of the members of said

board his total salary shall not exceed the sum above limited and the members of said board shall within ten days after their appointment take and subscribe an oath or affirmation before a properly qualified officer of the county in which they reside that they will faithfully and impartially perform the duties of their office which oath or affirmation shall be filed with the Secretary of the Commonwealth And the said board shall have the right from time to time to employ chemists assistant chemists attorneys agents and clerks for the purpose of carrying out the terms and conditions prescribed by this act of Assembly Any vacancy occurring in the said board shall be filled by the Governor of the State of Pennsylvania from among such only as are eligible for appointment under this act of Assembly Provided however if the office of a member shall become vacant before the expiration of the term for which said member was appointed the vacancy shall be filled by an appointment by the Governor for the unexpired term only.

Section 3. That all persons firms or corporations now owning or conducting or who shall hereafter own or conduct a pharmacy or pharmaceutical laboratory in Pennsylvania shall procure a license from the Pennsylvania Board of Pharmacy and renewal thereof each year thereafter The applicant for this license and for each renewal shall state in the application the location of the pharmacy or pharmaceutical laboratory the name or names of the person firm or corporation owning or conducting it and the names of all persons and employes engaged in the conduct or carrying on of the same who are registered as pharmacists or assistant pharmacists with the number and date of their certificates of competency and qualifications. This license shall entitle the holder thereof to own or conduct a pharmacy or pharmaceutical laboratory in accordance with the provisions of this act of Assembly at the place only for which it is issued. A fee of one dollar shall be paid to the Pennsylvania Board of Pharmacy for this license and for each renewal provided that upon application any unexpired license shall be transferred as to the location of the place and in the name of the holder thereof without the payment of an additional fee.

No person firm or corporation shall sell offer for sale or have in possession with intent to sell drugs or poisons at a store other than a pharmacy without first procuring from the said Pennsylvania Board of Pharmacy a license authorizing them to conduct a licensed store and sell same as herein provided. No such license shall be granted for a place within three miles by the most available route of travel to a licensed pharmacy. This license shall entitle the holder thereof to conduct a licensed store within the meaning of this act of Assembly for a period not exceeding one year and shall be used only for the store and place for which it is issued. A fee of one dollar shall be paid to the Pennsylvania Board of Pharmacy for this license. The Pennsylvania Board of Pharmacy shall grant said licenses under the terms and conditions of this act of Assembly and the rules and regulations of the Pennsylvania Board of Pharmacy for the enforcement of this act of Assembly.

Section 4. That the Pennsylvania Board of Pharmacy shall meet at least four times a year in the city of Harrisburg or such other place in Pennsylvania as they may deem expedient and examine all persons in the science of pharmacy and its allied branches who shall make application for registration as pharmacists or assistant pharmacists and that the said Pennsylvania Board of Pharmacy or a

majority of them shall grant to such persons as may be qualified registration and certificates of competency and qualification which shall entitle the holder thereof to act as a pharmacist or assistant pharmacist when duly licensed under the provisions of this act of Assembly.

Section 5 That every person applying to the Pennsylvania Board of Pharmacy for examination and registration as a pharmacist shall be not less than twenty-one years of age and of good moral character and must produce satisfactory evidence of having a certificate of preliminary educational qualification for licensure to practice pharmacy issued by the Bureau of Professional Education of Pennsylvania and of having had not less than four years' practical experience in a pharmacy where physicians' prescriptions are compounded and dispensed under the personal supervision of a registered pharmacist two years of which experience must have been in such pharmacy within the United States also of being a graduate of a properly chartered college of pharmacy recognized by the Pennsylvania Board of Pharmacy.

Each applicant for examination shall pay to the Pennsylvania Board of Pharmacy an examination fee of three (\$3.00) dollars. If the said applicant passes a satisfactory examination and has otherwise complied with the provisions of this act the said board shall grant the applicant registration and a certificate of competency and qualification as a pharmacist upon the payment of a fee of twelve (\$12.00) dollars provided said fee shall be paid to said board within thirty (30) days of the time that the said applicant is notified that a satisfactory examination has been passed.

Section 6. That every person applying for examination and registration as an assistant pharmacist shall not be less than eighteen years of age and of good moral character and must produce satisfactory evidence of having a certificate of preliminary educational qualifications for licensure to practice pharmacy issued by the Board of Professional Education of Pennsylvania and of having had not less than two (2) years experience in pharmacy where physicians' prescriptions are compounded and dispensed under the personal supervision of a registered pharmacist and if the said applicant passes a satisfactory examination and has otherwise complied with the provisions of this act the said board shall grant to said applicant registration and a certificate of competency and qualification as an assistant pharmacist upon payment of a fee of five (\$5.00) dollars provided that said fee shall be paid to the said board within thirty (30) days of the time that the said applicant is notified that a satisfactory examination has been passed.

Section 7. The Pennsylvania Board of Pharmacy shall grant registration under the provisions of this act of assembly without an examination and without fee to all persons registered as pharmacists or assistant pharmacists by the State Pharmaceutical Examining Board of Pennsylvania under the act of May twenty-fourth one thousand eight hundred and eighty-seven and various supplements and amendments entitled "An act to regulate the practice of pharmacy and the sale of poisons and to prevent adulterations in drugs and medicinal preparations in the State of Pennsylvania" as pharmacists or assistant pharmacists respectively and when so registered they shall be eligible to apply for a license to act as a pharmacist or assistant pharmacist as herein provided.

Section 8. That the Pennsylvania Board of Pharmacy shall issue to all appli-

cants who are properly registered under the provisions of this act of Assembly a license to act as pharmacists or assistant pharmacists upon application duly made in conformity with the rules and regulations of the Pennsylvania Board of Pharmacy for the enforcement of this act of Assembly. These licenses shall entitle the holders thereof to act as a pharmacist or assistant pharmacist respectively in a pharmacy licensed as provided in this act of Assembly. The board shall not charge any fee for this license.

Section 9. That any license to act issued by the Pennsylvania Board of Pharmacy by reason of the authority of this act of Assembly may be refused suspended or revoked by the Pennsylvania Board of Pharmacy for any of the following reasons:

First. When the applicant is not of good moral character.

Second. When the registration is shown to have been obtained by fraudulent means.

Third. When the applicant or holder is shown to be addicted to the use of narcotic drugs or stimulants to such an extent as to unfit the applicant or holder of the license for the proper performance at all times of the duties of a pharmacist or assistant pharmacist.

Fourth. When afflicted by mental disease of such character as to render the applicant or holder of the license a menace to the interests of the public if allowed to act as a pharmacist or assistant pharmacist.

Fifth. When the applicant or holder has been convicted twice of a wilful violation of this or any other statute relating to the practice of pharmacy or has been convicted of a crime involving moral turpitude.

And providing that any person who is an applicant for a license to act under this act of Assembly or who is licensed to act against whom are preferred any of the foregoing charges for causing the revocation suspension or refusal of the right to act shall be furnished by the Pennsylvania Board of Pharmacy with a copy of the charges and shall be given a hearing before the board and shall be allowed the privilege of attorney and witness. If it shall appear from the evidence that the license to act of the accused should be revoked suspended or refused then the Pennsylvania Board of Pharmacy shall act accordingly.

When a license to act has been revoked or suspended it shall be delivered to the secretary of the board on formal notice. Any person who shall refuse to deliver to the secretary the license that has been revoked or suspended by the board shall be guilty of a misdemeanor and upon conviction shall pay a fine of not less than one hundred (\$100.00) dollars.

For the purposes of enforcing this section of this act of Assembly the Board of Pharmacy shall have the power to administer oaths and compel the attendance of witnesses.

Section 10. That all licenses to conduct a pharmacy or a licensed store or licensed pharmaceutical laboratory issued under this act of Assembly shall expire on the thirty-first day of December of each year. The first of these licenses issued under this act of Assembly shall bear date of January first one thousand nine hundred and fourteen. Application for the renewal of the same shall be made on or before the first day of December of each year. Any person failing to apply for a renewal of his license in accordance with the provisions of this

section shall pay a penalty of one dollar per month or fraction thereof for each month succeeding the date of expiration.

Section 11 That every pharmacy licensed under this act of Assembly shall at all times keep in the pharmacy a copy of the latest revision of the United States Pharmacopoeia and the latest edition of the National Formulary and if homeopathic remedies are compounded and dispensed a copy of the latest revision of the American Homeopathic Pharmacopoeia or the Homeopathic Pharmacopoeia of the United States. Any person violating this section of this act of Assembly shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of ten (\$10.00) dollars and the costs of prosecution.

Section 12. That all certificates of competence and qualification as a pharmacist or assistant pharmacist issued under authority of the Commonwealth of Pennsylvania and all licenses and certificates issued under this act of Assembly shall at all times be conspicuously exhibited in the place of business licensed or where the licensed pharmacist or assistant pharmacist is employed. Any pharmacist violating this section of this act of Assembly as to the display of his own or his employees certificates shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of ten (\$10.00) dollars and the costs of prosecution.

Section 13. No licensee shall permit his license to be used by another for his protection nor shall any licensee permit his license to be displayed at a place where he is not actually employed. No license shall be granted for more than one pharmacy or one licensed store or one licensed pharmaceutical laboratory and any person who shall violate this section of this act of Assembly shall be guilty of a misdemeanor and upon conviction shall have his license revoked and shall be punished by a fine of not less than one hundred dollars (\$100.00) or by imprisonment in the county prison for a term of six months either or both in the discretion of the court.

Section 14. That the Pennsylvania Board of Pharmacy shall have the right to accept the certificates of the pharmacy boards of other states in lieu of examination for registration as pharmacists. Provided however that such other states have equivalent standards for registration. And provided further that the said states shall grant to pharmacists registered in accordance with the laws of Pennsylvania the same privileges subject to such rules and regulations as may be made from time to time by the said Pennsylvania Board of Pharmacy for the enforcement of this act of Assembly. A fee of twenty-five (\$25.00) dollars shall be paid for such registration.

Section 15. That it shall be unlawful for any person to impersonate an applicant before the Pennsylvania Board of Pharmacy who shall be applying either for a license or a certificate under the provisions of this act of Assembly. Any person violating this section of this act of Assembly shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of one hundred (\$100.00) dollars or to undergo an imprisonment of six (6) months in the county prison or either or both in the discretion of the court.

Section 16. That the Pennsylvania Board of Pharmacy shall from time to time make uniform rules and regulations subject to the approval of the Attorney General for the enforcement of this act of Assembly.

Section 17. That the Pennsylvania Board of Pharmacy shall make an annual

report to the Governor of Pennsylvania of the work performed by the board during the year together with a complete financial statement of all moneys received and all moneys paid out. Two thousand (2,000) copies of this report shall be printed by the State Printer of Pennsylvania and two (2) copies of each sent to each member of the Legislature the remaining copies to be distributed upon application by the Pennsylvania Board of Pharmacy. All papers and records together with the minutes of the board shall be filed in the office of the board.

Section 18. That hereafter it shall be unlawful to sell drugs medicines or poisons at retail or to compound physicians' prescriptions or to conduct a pharmacy or a licensed store or a licensed pharmaceutical laboratory within the meaning of this act of Assembly or to act as a pharmacist or assistant pharmacist except in compliance with the provisions of this act of Assembly provided however that nothing in this act of Assembly shall be so construed as to interfere with students of pharmacy or other employes in a pharmacy or licensed pharmaceutical laboratory from performing such duties as may be assigned to them. Provided that the compounding of medicine in a pharmacy or a licensed pharmaceutical laboratory and the compounding of physicians' prescriptions or the dispensing and selling of poisons at retail shall not be permitted except under the supervision of a pharmacist or assistant pharmacist.

Nothing in this act of Assembly shall be construed so as to prevent authorized practitioners of medicine dentistry or veterinary medicine from administering or dispensing such drugs to bona fide patients as he or she shall deem necessary. Provided however that drugs so dispensed shall conform to the standards of strength quality and purity as fixed by the laws of this Commonwealth. Any person violating the provisions of this section of this act of Assembly shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of not less than fifty (\$50.00) dollars nor more than five hundred (\$500.00) dollars or imprisonment for not more than one year or either or both in the discretion of the court.

Section 19. That it shall be unlawful for any person firm or corporation to use the title of pharmacist or assistant pharmacist except when so licensed under this act of Assembly or that of pharmacy licensed store or licensed pharmaceutical laboratory except when holding a license issued under this act of Assembly to conduct the same respectively. It shall further be unlawful to use the title drug store licensed pharmacy licensed drug store for a place where drugs are sold except in compliance with the provisions of this act of Assembly. Any person violating this section of this act of Assembly shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of fifty (\$50.00) dollars and the cost of prosecution.

Section 20. That the members of the Pennsylvania Board of Pharmacy or any of their authorized agents shall have the right to enter any place where drugs are compounded dispensed or sold for the purpose of purchasing samples and shall have the right to purchase samples in order that tests can be made to determine whether such drugs conform to the standards of strength quality or purity as fixed by the laws of this Commonwealth. Any person who intentionally prevents or knowingly refuses to permit any authorized person to enter any place where drugs are compounded dispensed or sold for the purpose of pur-

chasing samples or refuses to sell a sample or samples of drugs for the purpose of examination shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of ten (\$10.00) dollars and costs of prosecution.

Section 21. That all drugs sold or offered for sale in Pennsylvania must be labeled so as to show plainly on the package or bottle the name of the article or preparation therein contained. Provided that this section shall not apply to prescriptions of authorized practitioners of medicine dentistry or veterinary medicine. Any person violating this section of this act of Assembly shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of ten dollars (\$10.00) and the costs of prosecution.

Section 22. Poisons. That a poison in the meaning of this act of Assembly shall be any drug chemical or preparation which according to standard works on medicine toxicology or materia medica is liable to be destructive to adult human life in quantities of sixty (60) grains or less or any mixture compound or preparation containing in sixty (60) grains or less a sufficient quantity of any such drug chemical or preparation as to make the same liable to be destructive to adult human life if sixty (60) grains or less were to be taken.

No person shall sell at retail or dispense any poisons except as herein provided without affixing to the bottle box vessel or package containing the same a label printed or plainly written containing the name of the article the word "poison" and the name and place of business of the seller nor shall he deliver poison to any person without satisfying himself that the purchaser understands the poisonous nature of the article and that such poison is to be used for legitimate purposes.

It shall be the further duty of anyone selling or dispensing at retail poisons which according to standard works on medicine toxicology or materia medica are liable to be destructive to adult human life in quantities of five (5) grains or less before delivering them to enter in a book kept for this purpose the name of the seller and the name and residence of the buyer the name of the article the quantity sold or disposed of and the purpose for which it is said to be intended which book of registry shall be preserved for at least two years from last date of entry and shall at all times be open to inspection of the coroner police authorities or the agents of the Pennsylvania Board of Pharmacy. No manufacturer wholesaler jobber or other person shall sell any poisons as defined by this section to a retail dealer in drugs or any other person without affixing to the bottle box vessel or package containing the same a label printed or plainly written containing the name of the article and the word "poison." Provided however that the provisions of this section shall not apply to the dispensing of prescriptions of authorized practitioners of medicine dentistry or veterinary medicine specifying poisonous articles nor to the sale of mixed paints of all kinds white lead and colors ground in oil and all lead products for technical purposes. Any person violating this section of this act of Assembly shall be guilty of a misdemeanor and upon conviction shall be sentenced to pay a fine of not more than one hundred dollars (\$100.00).

Section 23. This act shall not apply to the sale of poisons for other than medicinal use and not sold or offered for sale as a drug within the meaning of this act of Assembly. Provided however the article is labeled to show plainly that it is not for medicinal use and is sold in compliance with section twenty-two

of this act. Nor shall this act be construed to prevent the sale of proprietary medicines proprietary remedies or proprietary preparations nor the sale of castor oil sweet oil turpentine linseed oil sal ammoniac sal soda baking soda washing soda copperas blue vitriol sulphur epsom salts rochelle salt spices flavoring extracts olive oil flaxseed hydrogen peroxide witch hazel water of ammonia cream of tartar essence peppermint essence Jamaica ginger essence wintergreen essence almonds essence spearmint essence birch chloride lime borax paraffine beeswax spermaceti honey logwood resin saltpetre pine tar moth balls bird seed alum arnica antiseptic face lotion bay rum bay essence brilliantine blood stopping stick blood stopping powder blood stopping cream camphor cream camphor ice caseline pomade cosmetique cold cream dandruff cure face creams hair tonics massage creams mantoline toilet water talcum powders shampoos witch hazel beef iron and wine camphor camphorated oil plasters glycerine petroleum jelly quinine glauher salts seidlitz powders turmeric. Nor the sale of any other article or compound of a like nature or character used other than as a medicine or drug.

Section 24. That all physicians' prescriptions compounded and dispensed shall be filed and kept for a period of at least five years and during that time they shall be open to the inspection of the police authorities upon presentation of an order from the court or to the members of the Pennsylvania Board of Pharmacy.

Section 25. All fees that may be received by said board under the provisions of this act and all fines and penalties recovered for violations of the provisions of this act shall be paid to the secretary of said board or to his agent or agents and by him paid into the state treasury for the use of the Commonwealth.

Section 26. The sum of fifteen thousand dollars or so much thereof as may be necessary be and the same is hereby appropriated for carrying out the provisions of this act for the two years beginning from the date of the approval of this act to be paid out by the state treasurer on the warrant of the secretary of said board approved by the auditor general.

This act shall be in force and effect on and after January first, one thousand nine hundred and fourteen.

OREGON PHARMACY LAW NOW IN FORCE.

Be it enacted by the People of the State of Oregon:

Section 1. It shall be unlawful for any person, from and after the passage of of this act, to manufacture, sell, or dispense any drug, poison, medicine, or chemical, or to dispense or compound any prescription of a medical practitioner, unless such person be a registered pharmacist or a registered assistant pharmacist within the meaning of this act, except as hereinafter provided. Every store, dispensary, pharmacy, laboratory or office for the sale, dispensing or compounding of drugs, medicines, or chemicals, or for the dispensing of prescriptions of medical practitioners, shall be in charge of a registered pharmacist. A registered assistant pharmacist may be left in charge of a store, dispensary, laboratory, or office for the sale, dispensing or compounding of drugs, medicines, or chemicals or for the dispensing of prescriptions of medical practitioners only during the temporary absence of the registered pharmacist. Temporary absence within the meaning of this act shall be held to be only those unavoidable absences which may occur during a day's work, and when

the registered pharmacist in charge shall be within immediate call, ready and able to assume the direct supervision of said pharmacy. No registered assistant shall conduct a pharmacy. Every store or shop where drugs, medicines or chemicals are dispensed or sold at retail, or where prescriptions are compounded, which has upon it or as a sign, the words "pharmacist," "pharmaceutical chemist," "apothecary," "druggist," "pharmacy," "drug store," "drugs," or any of these words, or the characteristic show bottles or globes, either colored or filled with colored liquids, shall be deemed a "pharmacy" within the meaning of this act.

Section 2. Any person in order to be a registered pharmacist must be a licentiate in pharmacy, or a practicing pharmacist.

Section 3. Licentiate in pharmacy are persons who have had four years experience in stores where the prescriptions of medical practitioners are compounded, and shall have passed an examination before the State Board of Pharmacy. Practicing pharmacists are persons who, at the passage of this act, are registered as such, and who shall have on or before the 21st day of May next succeeding the passage of this act, paid to the Board of Pharmacy of this State all moneys due for renewal of registration as required by the acts of the legislature regulating the practice of pharmacy in the State of Oregon, approved February 21, 1891, and February 25, 1895.

Section 4. Registered assistant pharmacists are persons who at the time of the passage of this act are already registered as such, and who shall have on or before the 21st day of May next, succeeding passage of this act paid to the Board of Pharmacy of this State all moneys due for renewal or registration as required by the acts of the legislature regulating the practice of pharmacy in the State of Oregon, approved February 21, 1891, February 25, 1895, and February 25, 1907; provided, that no person shall be examined or registered as a licentiate, unless such person has had four years' pharmaceutical experience in a pharmacy under the supervision of a registered pharmacist; and provided further, that no person shall be examined or registered as an assistant pharmacist unless such person be at least 18 years of age and has had three years pharmaceutical experience in a pharmacy under the supervision of a registered pharmacist.

Section 5. There shall be established in the State of Oregon a board to be known as the "Oregon Board of Pharmacy" to consist of five persons who shall be appointed for the term of five years by the Governor from the most competent registered pharmacists residing in different parts of this State, who are not teachers or instructors in any technical institution teaching pharmacy. Each appointee must have been a registered pharmacist in the State of Oregon for at least five years previous to his appointment, and he must be actually engaged in the practice of pharmacy at the time of his appointment; provided, whereas the Oregon Board of Pharmacy has heretofore been created in this State and is now instituted and organized, as provided in this act, the members of the Oregon Board of Pharmacy heretofore created shall constitute and be termed and taken to be the Oregon Board of Pharmacy established by this act, and the appointed members of said Board heretofore created shall respectively continue to hold office as members and officers of the Oregon Board of Pharmacy established by this act until the expiration of the terms for which they were originally appointed. The board shall organize by electing a president, secretary and treasurer.

The secretary may or may not be a member of the board, as the board in its sound discretion shall determine; provided, however, the secretary so appointed shall be a duly and regularly registered pharmacist under the laws of the State of Oregon. The secretary and treasurer shall each give satisfactory bonds running to the board of pharmacy in a sum not less than \$2000 or such greater sum as the board may from time to time require, for the faithful discharge of their respective duties.

Section 6. It shall be the duty of the secretary to keep a book of registration in which shall be entered under the supervision of the board the names, titles, qualifications and places of business of all persons coming under the provisions of this act.

The secretary shall give receipts for all moneys received by him and pay same to the treasurer of the board, taking his receipt for the same. The treasurer shall disburse the same by order of the board for necessary expenses, taking proper vouchers therefor. All moneys received in excess of the expenses incurred by said Board of Pharmacy shall be held by said Board of Pharmacy as a special fund for meeting further and necessary expenses. It shall be the duty of the secretary of the Board of Pharmacy to erase from the register the name of any registered pharmacist or assistant pharmacist who has died, or who in the opinion of the Board of Pharmacy has forfeited his right under the law to do business in this State. Besides the duties required by this act, it shall be the duty of the secretary to perform such other reasonable duties appertaining to his office as may be required of him by the Board of Pharmacy. The secretary shall receive such compensation as may be fixed by the Board of Pharmacy; if he be a member of the board, then such compensation shall be in addition to his per diem as a member of said board.

Section 7. Three members of the board shall constitute a quorum. They shall hold a meeting at least once in every three months.

Powers and Duties of the Board of Pharmacy.

Subdivision 1. The State board of Pharmacy shall have power

(a) To make such by-laws and regulations not inconsistent with the laws of this State, as may be necessary for the protection of the public, appertaining to the practice of pharmacy and the lawful performance of its duties.

(b) To regulate the practice of pharmacy.

(c) To regulate the sale of poisons.

(d) To employ inspectors of pharmacy and to inspect during business hours all pharmacies, dispensaries, stores or places in which drugs, medicines or poisons are compounded, dispensed or retailed, and to cause the prosecution of all persons whenever there appears to the Board of Pharmacy to be reasonable ground for such action.

(e) To examine and register as pharmacists and assistant pharmacists all applicants whom it shall deem qualified to be such. All persons applying for registration under this act shall pay the following fees therefor to the secretary of the Board of Pharmacy. Every applicant for registration shall pay a fee of ten dollars (\$10) on filling his or her application which shall be compensation to the Board of Pharmacy for examination of the applicant. The said Board of Phar-

macy shall require each and every registered assistant pharmacist to present himself or herself to the said State Board of Pharmacy for examination as a registered pharmacist within two years from the date of his or her first registration as an assistant pharmacist; and the said Board of Pharmacy shall authorize and empower the secretary of said board to cancel the certificate of registration of every registered assistant pharmacist who shall fail to present himself or herself for examination within the period hereinbefore specified.

(f) In the event any person having registered shall have lost his or her certificate of registration, or the same has been destroyed, or if he or she desires the renewal of same, a new certificate may be issued by said Board of Pharmacy upon the applicant paying therefor the sum of three dollars (\$3); provided further, that where the original certificate is not lost or destroyed, then the certificate shall be surrendered before a renewal of same shall be issued, and, provided further, that the board shall have power to require satisfactory evidence from the applicant of the loss or destruction of the certificate; and, further provided, that where the applicant is delinquent for the annual dues required by this act then he or she shall be required to pay to said board sufficient fees to recover his delinquency in that behalf before he or she shall be entitled to re-issue of the certificate in this subdivision provided for.

(g) To provide by proper rules and regulations for the revocation by said board of licenses issued under the provisions of this act whenever the holder of such license shall be guilty of habitual intemperance or addicted to the use of narcotic drugs, or shall have been convicted of a felony or shall have been convicted of two or more violations of any of the provisions of this act.

Section 8. The members of the board shall receive the sum of five dollars (\$5.00) for each day actually engaged in its services and all legitimate expenses incurred in attending meetings of said board; said expenses shall be paid from the fees received by the board under the provisions of this act. The board shall render an annual report of the work it has accomplished to the Governor and render an accounting of all moneys received and disbursed by them pursuant to this act.

Section 9. Every person holding a certificate from said Board of Pharmacy shall renew annually their registration with said Board, and every registered pharmacist and every registered assistant pharmacist who desires to retain his registration on the books of the Board of Pharmacy in this State, shall annually after the expiration of the first year's registration and on or before the 21st day of May of each year succeeding pay to the secretary of the Board of Pharmacy a renewal fee to be fixed by the board, which shall not exceed one dollar (\$1) for registered pharmacists and one dollar (\$1) for registered assistant pharmacist, in return for which fee a renewal certificate of registration shall be issued. A penalty of five dollars (\$5) for registered pharmacists and two dollars and fifty cents (\$2.50) for registered assistant pharmacists will be added to the renewal fee of every registered pharmacist and every registered assistant pharmacist who fails to comply with this provision within sixty days from and after the 21st day of May of each year, and if said renewal fee is not paid with all penalties due thereunder before the first regular quarterly meeting of the Board of Pharmacy, thereafter the certificates of every registered pharmacist and every

registered assistant pharmacist failing to comply with the provisions heretofore mentioned will be cancelled, and the certificates so cancelled can only be renewed thereafter by an examination before the Board of Pharmacy as required by all persons presenting themselves for registration as registered pharmacists or registered assistant pharmacists.

Section 10. Every person upon receiving a certificate of registration under this act or who has heretofore received a certificate of registration in this State, shall keep his certificate and last receipt for re-registration conspicuously exposed in his place of business. Every registered pharmacist and every registered assistant pharmacist shall within 30 days after the changing of his place of business as designated on the books of the Board of Pharmacy, notify the secretary of the board of his new place of business, and upon receipt of said notification the secretary shall make the necessary change in his register.

Section 11. Every proprietor or manager of a pharmacy or drug store shall be held responsible for the quality of all drugs, chemicals and medicines sold or dispensed by him, except those sold in the original package of the manufacturer, and also excepting those articles or preparations known as patent or proprietary medicines. Any person who shall knowingly, willfully or fraudulently falsify or adulterate, or cause to be falsified or adulterated, any drug or medical substance, or any preparation authorized or recognized by the pharmacopoeia of the United States or used or intended to be used in medical practice, or shall mix or cause to be mixed, with any such drug or medical substance any foreign or inert substance whatever, for the purpose of destroying or weakening its medicinal power or effect, or of lessening its cost and shall willfully, knowingly or fraudulently sell the same or cause the same to be sold for medical purposes, shall be guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than fifty dollars (\$50) and not more than two hundred dollars (\$200) or by imprisonment for a period of not exceeding two hundred (200) days, or by both such fine and imprisonment. Every registered pharmacist shall file or cause to be filed all physicians' prescriptions, or a copy thereof, compounded or dispensed in his pharmacy or store and all prescriptions so filled shall be preserved for at least five years from the date of the filling thereof. Any person who shall willfully fail so to do shall be liable to a fine not exceeding fifty dollars (\$50) and for each subsequent offense shall be liable to a fine of not less than fifty dollars (\$50) and not more than one hundred dollars (\$100.)

Section 12. Any person who shall attempt to secure or secures registration for himself or herself or any other person under this act by making or causing to be made any false representations, or who shall fraudulently represent himself to be registered shall be deemed guilty of a misdemeanor and upon conviction thereof shall be liable to punishment by a fine not exceeding one hundred dollars (\$100) or by imprisonment for a term not exceeding fifty days or by both such fine and imprisonment. Any person who shall permit the compounding of prescriptions of medical practitioners, or the selling of drugs, medicines, chemicals or poisons in his or her store or pharmacy, except by a registered pharmacist or registered assistant pharmacist or who violates any of the provisions of this section of this act, shall be deemed guilty of a misdemeanor, and upon conviction thereof, shall be liable to punishment by a fine of not less than one hundred

dollars (\$100) and not more than two hundred dollars (\$200) or by imprisonment of not exceeding 50 days, or by both such fine and imprisonment; provided, however, that nothing in this act shall apply to or interfere with any practitioner of medicine or dentistry who is duly registered as such by their respective State Board of Examiners of this State, with supplying his own patients, as their physician or dentist and by them employed as such, with such remedies as he may desire, and who does not keep a pharmacy, open shop or drug store, advertised or otherwise, for the retailing of medicines or poisons; nor does this act apply to the exclusive wholesale business of any dealer, nor to the manufacture or sale of proprietary medicines or patent medicines, or to the sale of any household remedies and medicines, by general dealers not druggists, in the original packages, when properly labelled; nor does this act apply to the supplying by veterinary surgeons duly registered under the laws of the State of Oregon of remedies required in the practice of their profession; nor to the sale by grocers and dealers generally of the following named poisons, to wit: Fly paper, ant poison, squirrel poison, gopher poison, blue stone and arsenical poison used for orchard spraying when sold in the original unbroken packages and labelled with the name of the dealer and the word "poison."

Section 13. Any proprietor of a pharmacy who shall fail or neglect to place in charge of such pharmacy a registered pharmacist, or any proprietor of a pharmacy who shall by himself or any other person permit the compounding of prescriptions or the vending of drugs, medicines or poisons, in his or her store or place of business, except by a registered pharmacist or a registered assistant pharmacist, or any person not being a registered pharmacist who shall take charge of, or act as manager of any pharmacy or store, or who, not being a registered pharmacist or registered assistant pharmacist, retails, compounds or dispenses drugs, medicines or poisons, shall be guilty of a misdemeanor, and upon conviction thereof shall be liable to a fine of not less than one hundred dollars (\$100) and not more than two hundred dollars (\$200) or by imprisonment for a term of not exceeding 50 days, or by both such fine and imprisonment.

Section 14. Any person who is a duly and regularly registered and licensed pharmacist under the laws of any state of the United States of America, and is in good standing in the state in which he or she shall be registered, or any other person who may furnish satisfactory evidence to the secretary of the State Board of Pharmacy that he or she is qualified to become a registered pharmacist under the laws of the State of Oregon may make written application to the secretary of the State Board of Pharmacy and a temporary certificate of registration to practice pharmacy in the State of Oregon, until the next regular meeting of the State Board of Pharmacy may be issued. Every applicant for a temporary certificate of registration shall pay a fee of five dollars (\$5) on filing his or her application for a temporary certificate, which shall be compensation to the State Board of Pharmacy for investigation or examination of the applicant. The secretary may examine the applicant orally or in writing. If, in the judgment of the secretary, the applicant is qualified, he shall issue to said applicant a temporary certificate to practice pharmacy in the State of Oregon until the next regular meeting of the State Board of Pharmacy; provided, that the secretary shall issue but one temporary certificate to the same applicant and no temporary

certificate shall be granted to any person whose application has been denied by the State Board of Pharmacy, and no temporary certificate to practice pharmacy in the State of Oregon shall be issued by the secretary to an assistant pharmacist; provided further, that no temporary certificate shall be issued by the secretary for a longer period than until the first day of the next regular meeting of the State Board of Pharmacy after the issuance of said temporary certificate; and provided further, that the holder of a temporary certificate to practice pharmacy shall pay the regular fee of ten dollars (\$10) upon the filing of his or her application to become a registered pharmacist by examination before the State Board of Pharmacy, as provided for in this act.

Section 15. It shall be the duty of the Board of Pharmacy, by resolution, at least annually, to request of the chief of police, marshal, or constable of every city, town, or township in this state, and the sheriff of every county in this state, to furnish a list of all drug stores, together with the names of the owners, managers and all employes in said stores, and a brief statement of the capacity in which said persons are employed in said stores, and also the firm name of all stores retailing drugs, medicines, or poisons. Upon such request in writing it shall be the duty of the chief of police, marshal, constable, or sheriff of said city, town or township or county, to require the patrolmen or deputies under their command to obtain such lists as are in this section specified, and to deliver same to the Board of Pharmacy. It shall be the duty of the owner or manager of any drug store or other store dealing or retailing drugs, medicines or poisons, when called upon by an officer as above set forth, or by a member of the Board of Pharmacy, or by a duly authorized inspector, to furnish said officer, member of the Board of Pharmacy, or duly authorized inspector with the information required by the provisions of this section. Any person refusing to furnish the information, or willfully furnishing information that is false or untrue, shall be deemed guilty of a misdemeanor, and upon conviction thereof, shall be punished by a fine of not less than fifty dollars (\$50) nor more than one hundred dollars (\$100) or by imprisonment for not less than 10 days and not more than 35 days, or by both such fine and imprisonment.

Section 16. It shall be unlawful for any person from and after the passage of this act to vend, sell, give away or furnish, or cause to be vended, sold, given away or furnished, either directly and indirectly any of the following poisons, to wit:

Arsenic and its preparations, white precipitate, biniodide of mercury, cyanide of potassium, hydrocyanic acid, strychnine, essential oil of bitter almonds, aconite, belladonna, nux vomica, oil of savin, oil of tansy, ergot, cotton root, cantharides, carbolic acid (phenol), corrosive sublimate, corrosive sublimate tablets, antiseptic tablets containing corrosive sublimate, and other deadly poisons in original packages or otherwise without labeling the box, vessel or bottle in which said poison is contained, with the name of the article, and the word "poison" and the name, and place of business of the seller; nor shall it be lawful for any person to deliver or sell said poisons unless upon inquiry it be found that the purchaser is aware of its poisonous character.

Deadly poisons, within the meaning of this act, shall be any drug, chemical or

preparation which, according to the standard works on medicine, toxicology or materia medica is liable to be destructive to adult human life.

It shall be unlawful for any person to give a fictitious name or make any false representations to the seller or dealer when buying any of the poisons aforesaid. It shall be unlawful to sell or deliver, or cause to be sold or delivered, any of the poisons aforesaid without making or causing to be made an entry in a book kept solely for that purpose, stating the date, hour of the sale, the name and address and the signature of the purchaser, the kind and quantity of the poison sold, a statement by the purchaser of the purpose for which it is required, and the name of the dispenser, who must be a duly registered pharmacist or a duly registered assistant pharmacist. Said book shall be in the following form:

Date and Hour	Name of Purchaser	Residence	Kind and Quantity	Purpose of Use	Signature of Druggist	Signature of Purchaser
------------------	----------------------	-----------	----------------------	-------------------	--------------------------	---------------------------

This book shall always be open for inspection by the proper authorities and shall be preserved for at least five years after the date of the last entry therein; provided further, that nothing herein contained shall apply to the dispensing of physicians' prescriptions of any of the poisons aforesaid, nor to the manufacture, making, or selling at wholesale any poisons; provided, each box, vessel or package in which said poison is contained (except physicians' prescriptions) shall be labeled as herein provided. Any person violating any of the provisions of this section shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than fifty dollars (\$50) nor more than two hundred dollars (\$200) or by imprisonment for a period not exceeding one hundred days, or by both such fine and imprisonment.

Section 17. When, in the opinion of the State Board of Pharmacy, it is in the interest of the public health, they are hereby empowered to further restrict or prohibit the retail sale of any poison by rules, not inconsistent with the provisions of this act, by them to be adopted, and which rules must be applicable to all persons alike. It shall be the duty of the board, upon request, to furnish any dealer with a list of all articles, preparations, and compounds, the sale of which is prohibited or regulated by this act.

Section 18. It shall be unlawful for any person, firm or corporation to vend, sell, furnish or give away, or cause to be vended, sold, furnished or given away, or offer to sell, vend, furnish or give away, or cause to be offered to be vended, sold, furnished or given away, or to have in his or their possession any cocaine, opium, morphine, codeine, heroin, alpha eucaine, beta eucaine, nova caine, or chloral hydrate, or any of the salts, derivatives or compounds of the foregoing substances or any preparation or compound contained in or containing any of the foregoing substances or their salts, derivatives or compounds, excepting upon the written order or prescription of a physician or dentist or veterinary surgeon licensed to practice in this state, which order or prescription shall be dated and shall contain the name of the person for whom prescribed written in by the person writing such prescription, or if ordered by a veterinary surgeon it shall state the kind of animal for which ordered and shall be signed by the person giving the prescription or order. Such order or prescription shall be permanently retained on file by the person, firm or corporation who shall com-

pound or dispense the articles ordered or prescribed and it shall not be again compounded or dispensed. No copy or duplicate of such written order shall be made or delivered to any person, but the original shall be at all times open to inspection by the prescriber and properly authorized officers of the law and shall be preserved for at least three years from the date of the filing thereof; provided, that the above provisions shall not apply to sales at wholesale by jobbers, wholesalers and manufacturers to pharmacies; and, further provided, that the above provisions shall not apply to preparations sold or dispensed without a physician's prescription containing less than two grains of opium, or one-fourth grain of morphine, or one-half grain of codeine, or one-sixth grain hereoin, or one-sixth grain cocaine, or one-sixth grain eucaïne, or one-sixth grain nova caine, or one-sixth grain beta eucaïne, or ten grains chloral hydrate in one fluidounce, or if a solid preparation, in one avoirdupois ounce; and, further provided, that the above provisions shall not apply to the sale or compounding of remedies used for veterinary purposes and liniments. Any person violating any of the provisions of this section shall upon conviction be punished as follows: For the first offense by a fine of not less than one hundred dollars (\$100) and not more than two hundred and fifty dollars (\$250) or by imprisonment for not more than one hundred days, or by both such fine and imprisonment; for the second offense by a fine of not less than two hundred dollars (\$200) nor more than five hundred dollars (\$500), or by imprisonment for not more than two hundred days, or by both such fine and imprisonment; and for the third offense by imprisonment in the state penitentiary for not less than one year nor more than five years.

Section 19. Any itinerant or traveling vendor or hawker of any drug, nostrum, ointment or application of any kind for the treatment of any disease or injury, before offering any such drug, nostrum, ointment or application for sale shall pay to the treasurer of the Oregon Board of Pharmacy an annual fee of two hundred dollars (\$200) upon the receipt of which the secretary of the board shall issue a license for one year from the date of said payment; one-half of all such license fees shall be devoted to defraying the expenses of the board and the remainder shall be paid as it is received by the treasurer of the Oregon Board of Pharmacy into the state school fund. Itinerant vendors under the meaning of this act shall include all persons who carry on the business above described by passing from house to house, or by haranguing the people on the public streets or in public places, or use the various customary devices for attracting crowds and therewith recommending their wares and offering them for sale. Any violation of this section shall be a misdemeanor and any person shall upon conviction thereof pay a fine of not less than two hundred dollars (\$200) nor more than three hundred dollars (\$300), and in default of such payment shall be imprisoned in the county jail for the period of one day for each two dollars (\$2) of such fine. In case of prosecution under this section it need not be proven that the defendant has not a license, but the fact that he has a license may be a matter of defense; provided, however, that nothing in this act shall be construed to prevent the collection of any tax or license that may be imposed by any county or municipal authority.

Section 20. All actions for the recovery of the several penalties prescribed in

this act shall be prosecuted by the district attorney for the proper county in the name of the State of Oregon, upon the information of himself or any member of the State Board of Pharmacy, or the duly authorized agent or agents of the State Board of Pharmacy; and it shall be the duty of the district attorney to prosecute all persons violating any of the provisions of this act, and to sue for all penalties herein provided for upon proper complaint being made. All penalties collected under the provisions of this act unless otherwise provided, shall inure one-half to the State Board of Pharmacy and the remainder to the county treasurer for the use of the school fund of the county in which the prosecution was conducted.

Section 21. All moneys recoverable under the provisions of this act shall be paid by the magistrate or other officer receiving the same to the treasurer of the State Board of Pharmacy.

Section 22. Circuit and justice courts shall have exclusive original jurisdiction for the violation of any misdemeanor contained in this act.

Section 23. Sections 4750 to 4773, inclusive, of Chapter 7 of Title XXXV of Lord's Oregon Laws and all acts and parts of acts in conflict with this act are hereby repealed.

NARCOTIC LAWS PROPOSED, ENACTED OR AMENDED.

CONNECTICUT NARCOTIC LAW OF 1913.

Section 1. No person shall sell, furnish, or give away, except to a licensed physician, pharmacist, dentist, or veterinarian in the manner hereinafter provided, any cocaine, salts of cocaine, or any preparations containing cocaine or salts of cocaine, eucaine or its salts, or heroin or diacetyl morphine and its salts, or dionin or ethyl morphine or any of its salts or derivations, or morphine or any derivation thereof, or any gum or natural opium except in a form adapted to external use only, or in preparations containing not more than one-half grain of morphine, or not more than one-half grain of heroin in one fluidounce, or if a solid preparation, in one avoirdupois ounce except upon the receipt of a prescription properly written and signed by a licensed physician, and only within five days after the date of such prescription. Every such prescription shall be retained by the person who dispenses the same and shall be filled but once, and shall be kept in a separate file or book; and said person shall enter in a book kept for that purpose, the date of the sale, the name and address of the purchaser, and the name of the person making such sale. Such prescription shall contain the date of its issue, the name of the person to whom it is issued, and the prescription in full.

Sec. 2. No person shall sell to any pharmacist, physician, dentist, or veterinarian, any of the preparations referred to in section one of this act, except upon receipt of a written order therefor, which shall contain the date, the name and quantity of the article desired, and the name of the person to whom the article is sold, and said order shall be retained in a separate file or book by the person dispensing the same.

Sec. 3. Every person who shall sell any of the drugs mentioned in section

one upon the orders provided for in section two shall file with the commissioners of pharmacy, on or before the tenth day of each month, a report showing all such sales made during the preceding month, provided licensed pharmacists making sales to licensed physicians, dentists, or veterinarians only shall not be required to make such report.

Sec. 4. The commissioners of pharmacy shall prepare and furnish to all local boards of health and health officers, official order blanks, serially numbered with stubs attached, in book form, upon which blanks must be written in ink orders for the purchase of any of the drugs mentioned in this act, by any physician, pharmacist, dentist, or veterinarian, and such orders shall be furnished, by said boards of health and health officers, to any licensed physician, pharmacist, dentist, or veterinarian. Each of said blanks shall have printed thereon a facsimile of the seal of the state of Connecticut.

Sec. 5. No person shall copy the original prescription or order written by any person authorized to issue the same, in accordance with the provisions of this act, or use a copy of the original prescription or order for the purpose of obtaining any of the drugs mentioned in this act, and no prescription shall be refilled except upon an order written upon the original prescription by the physician who issued it.

Sec. 6. All written orders and prescriptions required by this act and filed, in accordance with its provisions, with any person, jobber, wholesaler, or manufacturer shall be open to the inspection of all prosecuting authorities.

Sec. 7. No person not a licensed physician, dentist, jobber, wholesaler, manufacturer, or pharmacist, shall have in his possession at any time more than five grains of any of the drugs mentioned in section one.

Sec. 8. Any person who shall violate any of the provisions of this act shall be fined not more than five hundred dollars, or imprisoned no more than one year, or both.

Sec. 9. The commissioners of pharmacy, in making payments to the treasurer of the state, as provided by section fifteen of chapter 216 of the public acts of 1909, are hereby authorized to retain, in the hands of the treasurer of said commission, a balance not exceeding five hundred dollars as a reserve fund for the purpose of defraying expenses.

Sec. 10. Chapter 127 of the public acts of 1905 and chapter 30 of the public acts of 1909 are hereby repealed.

Sec. 11. This act shall take effect from its passage.

Approved June 25, 1913.

INDIANA NARCOTIC LAW OF 1913.

(H. B. 277. Approved March 6, 1913.)

Drugs—Sale of Cocaine, Etc.—Prescription.

Section 1. Be it enacted by the General Assembly of the State of Indiana, that it shall be unlawful for any person, except a registered pharmacist to retail, sell or give away any cocaine, alpha, or beta eucaine, opium, morphine or heroin, cannabis indica, or any salt or any compound, or derivative of any of the foregoing substances, or any of their salts or compounds, or derivatives, and they only upon the written prescription of a duly registered physician, licensed veteri-

narian, or licensed dentist; and it shall be unlawful for any duly registered physician, licensed veterinarian or licensed dentist to write, issue, deliver or dictate either directly or indirectly, any prescription to or for any habitual user of any drugs enumerated in this section; every prescription shall contain the name and address of the person for whom prescribed, and the date the same shall have been filled, and shall be permanently retained on file by the person, firm or corporation where the same shall have been filled; and it shall be filled but once, and no copy of it shall be taken by any person, except a copy may be taken by the board of pharmacy, or their agents, and the original shall at all times be open to the inspection of the prescriber, to the Indiana State Board of Pharmacy or their agents, and all officers of the law; except, however, that such cocaine, alpha or beta eucaine, opium, morphine, heroin, or any salt, or any compound, or any derivative of the foregoing substances, or any of their salts or compounds, or derivatives, may be lawfully sold at wholesale by a wholesale jobber or manufacturer upon the written order of a licensed pharmacist, duly registered, practicing physician, licensed veterinarian, or licensed dentist; and provided, that the wholesaler, jobber or manufacturer, shall affix or cause to be affixed to the bottle, box, vessel or package, containing the article sold, and upon the outside wrapper of the package, as originally put up, a label distinctly displaying the name and quantity of cocaine, alpha or beta eucaine, opium, morphine, heroin, or any salt or compound or derivative of any of the foregoing substances, sold, and the word "Poison," with the name and place of business of the seller, all printed in red ink; and provided, also, that the wholesaler, jobber or manufacturer shall, before delivering any of the articles, make or cause to be made in a book kept for that purpose, an entry of the sale thereof, stating the date of sale, the quantity, name and form in which sold, the name and address of the purchaser, and the name of the person by whom the entry is made; and the said book shall always be open for the inspection by the members of the State Board of Pharmacy or agents thereof, and the proper officers of the law, and said book shall be preserved for five years after the date of the last entry therein; and provided, further, that all persons selling or dealing in cocaine, alpha and beta eucaine, opium, morphine, heroin, or any salt, or any compound or any derivative of the foregoing substances, either at wholesale or retail, shall once each month, at a time to be designated by the Indiana Board of Pharmacy, prepare and mail to the secretary of the Indiana Board of Pharmacy, on blanks to be prepared by such board, a report of all sales of cocaine, alpha and beta eucaine, opium, morphine, heroin, and any sale of any compound or any derivative of the foregoing substances made during the thirty days preceding such report, and the dates of such sales, the amount sold and the name of the person to whom such sales were made; provided, also, that nothing in this act shall apply to any preparation, patent, or proprietary, containing not more than two grains of opium, or one-fourth of a grain of its alkaloidal salts, or their derivatives to the ounce, or admixtures of ipecac and opium commonly known as Dover's powders, liniments, suppositories, ointments and plasters, plainly labeled "For External Use Only"; provided, also, that nothing in this act shall be construed to prevent the legitimate administering of said drugs, their salts, compounds and derivatives by a duly registered practicing physician, duly licensed veterinarian or duly licensed dentist.

Penalty.

Section 2. That section two be amended to read as follows: Section 2. Any person violating any of the provisions of the foregoing section on the first offense shall be guilty of a misdemeanor and on conviction shall be fined not less than \$25 nor more than \$500, and imprisoned in the county jail not less than ninety days, nor more than one year; and for each succeeding offense, he shall be guilty of a felony and shall be fined not less than \$200, nor more than \$1,000, and imprisoned in the state prison or reformatory not less than one year, nor more than eight years, and if the person so offending shall have a license as a physician, veterinarian, dentist or pharmacist, such license shall be revoked by the court trying said cause; and it shall be the duty of the prosecuting attorney of the county where such offense is committed to prosecute all persons violating provisions of this act under proper complaint being made, and upon failure of such prosecuting attorney to act, it shall be the duty of the attorney general of the State of Indiana to prosecute any person violating the provisions of section one of this act. It shall be the duty of the Indiana Board of Pharmacy to enforce the provisions of this act and to adopt such rules and regulations as it may deem best to carry out the provisions of this act.

MAINE NARCOTIC LAW OF 1913.

Be it enacted by the people of the State of Maine, as follows:

Section 1. No person, firm or corporation shall manufacture any so-called catarrh powder or catarrh cure, or any patent or proprietary preparation containing cocaine, or any of its salts, or alpha or beta eucaine, or any of their salts, or any synthetic substitute for them.

Sec. 2. No person, firm or corporation shall sell, or expose or offer for sale, or give, deliver or exchange cocaine, or alpha or beta eucaine, or any synthetic substitute for them or any preparation containing the same, or any salts or compounds thereof, except upon the written prescription of a physician, dentist, or veterinary surgeon, registered under the laws of the state in which he resides, which prescription shall be dated and bear the name of the person giving it and of the person prescribed for, and the original prescription shall be retained by the druggist filling the same for at least two years and shall not again be filled, except upon the written order of the original prescriber, and shall at all times be open to inspection by members of the state board of health, members of the state board of pharmacy, and their authorized agents, by state officials and their authorized agents, and by the police authorities and officers of cities and towns. But no practitioner of veterinary medicine shall prescribe any of the above mentioned substances for the use of a human being.

Sec. 3. No person shall sell, furnish, give away or deliver opium, morphine, heroin, codeine, cannabis indica or cannabis sativa, or any salt, compound or preparation of said substances except upon the written prescription or order of a lawfully authorized practitioner of medicine, dentistry or veterinary medicine, which prescription shall be dated and shall bear the name of the person giving it, and the name of the person prescribed for; which original prescription shall be retained by the druggist filling the same for at least two years, and shall not again be filled except upon the written order of the original prescriber. Such

prescriptions shall at all times be open to inspection by members of the state board of health, the state board of pharmacy, state officials and their duly authorized agents, and by the police authorities and officers of the cities and towns. But no practitioner of veterinary medicine shall prescribe any of the above substances for the use of a human being. The provisions of this section shall not apply to sales made by a manufacturer or wholesale or retail druggist to another manufacturer, wholesale or retail druggist; nor to sales made to hospitals, colleges, scientific or public institutions, or to physicians, dentists or veterinary surgeons; nor to the sale of cough remedies and other domestic and proprietary preparations, provided that such remedies and preparations are sold in good faith as medicines, and not for the purpose of evading the provisions of this act, and provided further that such remedies and preparations do not contain more than two grains of opium, one-fourth of a grain of morphine, or one-fourth of a grain of heroin, or one grain of codeine or their salts, in one fluid ounce, or, if a solid preparation, in one avordupois ounce; but such provisos shall not apply to liniments and ointments which are prepared for external use only. Nor shall the provisions of this section apply to preparations containing opium or any of its salts, which are sold in good faith as remedies for diarrhoea, cholera or neuralgia, nor to powder of ipecac and opium, commonly known as Dover's powders, provided, that any such preparation is sold in good faith as medicine and not for the purpose of evading the provisions of this act.

Sec. 4. No practitioner of medicine, dentistry, or veterinary medicine shall prescribe for the use of an habitual user of the same, opium, morphine, heroin, codeine, or any salt or compound of the said substances, or any preparation containing any of the said substances or their salts or compounds, or cocaine, or its salts, or alpha or beta eucaine or their salts, or any synthetic substitute for them, or any preparation containing the same or any salt or compound thereof; nor shall any practitioner of dentistry prescribe any of the said substances for any person not under his treatment in the regular practice of his profession; nor shall any practitioner of veterinary medicine prescribe any of the substances for the use of a human being, provided, however, that the provisions of this section shall not be construed to prevent a lawfully authorized practitioner of medicine from prescribing for the use of any habitual user of hypnotic or narcotic drugs, who is under the professional care of such practitioner, such substances as he may deem necessary for treatment, if such prescriptions are given in good faith and not for the purpose of evading the provisions of this act.

Sec. 5. A manufacturer or jobber of any or all of the drugs enumerated in Sections 2 and 3 of this act, a wholesale druggist, or a registered pharmacist may sell any drug mentioned in said sections 2 and 3 to a manufacturer, jobber, wholesale druggist, or to a pharmacist, physician, veterinarian or dentist, qualified to practice under the laws of this state, or to an incorporated hospital but only upon a written order duly signed by such manufacturer, jobber, wholesale druggist, registered pharmacist, registered physician, registered veterinarian, registered dentist, or the superintendent of such incorporated hospital, which order shall show the article or articles ordered and the date of delivery. The said order shall be kept on file in the laboratory, warehouse, pharmacy or store from which it was filled by the proprietor thereof, or his successor, for a period of not less than two

years from the date of delivery, and shall at all times be open to inspection by officers of the state board of health, members of the state board of pharmacy, or their authorized agents, state officials and their authorized agents, and the police authorities and officers of cities and towns; and such order shall not contain items of any drug not mentioned in Sections 2 and 3 of this act.

Sec. 6. A person not being a physician dentist or veterinary surgeon, qualified to practice in this state, or not being a manufacturer or wholesale or retail dealer in drugs, who has in his possession opium, morphine, heroin, codeine, cannabis indica, cannabis sativa or any other hypnotic or narcotic drug or salt, compound or preparation of said substances, cocaine, alpha or beta eucaine or any synthetic substitute for them, or any preparation containing the same, or any salts or compounds thereof, except by reason of a prescription of a physician, dentist or veterinary surgeon qualified to practice in this state, shall be punished as provided in Section 8 of this act. The provisions of this section shall not apply to a person, firm or corporation while transporting any of the above mentioned drugs from or to a manufacturer or jobber, wholesale druggist, registered pharmacist, registered physician, registered veterinarian, registered dentist, or incorporated hospital, nor to persons who may have the above mentioned articles in their possession in connection with the enforcement of the provisions of this act or with the trial of cases arising thereunder. Possession of any of the drugs mentioned in this section shall be prima facie evidence that such possession is unlawful.

Sec. 7. No practitioner of medicine, surgery, dentistry or veterinary medicine shall dispense, furnish or give away opium, morphine, heroin, codeine, cannabis indica, cannabis sativa, or any salt compound of said substances or any preparation containing any of the said substances or their salts or compounds, or cocaine or its salts or alpha or beta eucaine or their salts or any synthetic substitute for them, or any preparation containing the same or any salt or compound thereof except in good faith as medicines for diseases indicated, and the aforesaid practitioners shall keep a record in a book kept solely for that purpose of the name and address of the patient treated and the name of the disease indicated and the quantity of the drug dispensed, furnished or given away on each separate occasion, which record shall be made within 48 hours of the dispensing or furnishing or giving away and shall be preserved for at least two years, and shall at all times be open to inspection by members of the state board of health, members of the state board of pharmacy or their authorized agents, by state officials or their authorized agents or by the police authorities or officers of cities and towns. But no practitioner of medicine, surgery or dentistry shall dispense or prescribe, except for his own professional use, more than four grains of morphine, cocaine, heroin, opium, or any other hypnotic or narcotic drug, their salts, compounds, or any preparation of the same.

Sec. 8. A person who violates a provision of the foregoing sections, or aids or abets another in the violation thereof, shall be fined not more than one thousand dollars nor less than fifty dollars, or be imprisoned not more than one year, or both. Judges of the municipal and police courts and trial justices shall have original and concurrent jurisdiction with the superior courts of offences under this act.

Sec. 9. The director of the Maine Agricultural Experiment Station shall make

a chemical analysis to determine the composition and quality of any substance mentioned in this act on application of the county attorney of any county of Maine, and shall furnish a certificate certifying to the composition or quality thereof. The certificate under seal of the Maine Agricultural Experiment Station which shall be affixed by the chemist thereof making the analysis shall be prima facie evidence of the composition and quality of the substance analyzed.

NEW YORK COCAINE LAW OF 1913.

Section 1. Section seventeen hundred and forty-six of chapter eighty-eight of the laws of nineteen hundred and nine, entitled "An act providing for the punishment of crime, constituting chapter forty of the consolidated laws," as amended by chapter one hundred and thirty-one of the laws of nineteen hundred and ten, is hereby repealed.

§ 2. Such chapter is hereby amended by inserting therein a new section to be section seventeen hundred and forty-six to read as follows:

§ 1746. Sale of cocaine or eucaine, and regulations respecting their possession. Alkaloid cocaine or its salts, or alpha or beta eucaine or their salts, or any admixture, compound, solution or product of which cocaine or eucaine or their salts may be an ingredient, shall not be sold, offered for sale, furnished, disposed of, given away or possessed by any person except in the manner prescribed in this section and by the persons authorized herein.

(a) It shall be lawful for a licensed pharmacist or a licensed druggist, upon the written prescription of a physician duly registered and licensed to practice in the state of New York, to sell or dispense alkaloid cocaine or its salts or alpha or beta eucaine or their salts. If in such prescription the percentage of such substances to the total contents of the prescription shall exceed one per centum thereof the pharmacist or druggist to whom such prescription is presented shall before filling the same verify the prescription by inquiry of the physician issuing the same. Such prescription shall be retained by the person dispensing the drug, and no copy of such prescription shall be made by or delivered to any person, and such prescription shall be filled but once, except that it shall be lawful for a licensed pharmacist or druggist to refill and to give to the person presenting same a copy of a prescription of which cocaine or eucaine is a component part, if the proportion of such substance to the total content of the prescription does not exceed one grain thereof to each fluid ounce or in the case of ointment does not exceed two grains of such substance to the ounce. When any of such substance is so dispensed or sold upon such written prescription of a physician the person selling or dispensing the same shall simultaneously deliver to the person to whom the same is sold or furnished a certificate stating the name and address of the person selling or furnishing such drug or mixture, the name and address of the physician upon whose prescription the same is sold or furnished, the date of sale and the amount sold. The possession of such certificate shall be a defense to a charge of misdemeanor under paragraph (h) of this section, provided the person possessing such substance shall not have in his possession an amount exceeding the amount specified in such certificate, and provided that such certificate shall not legalize the possession of such substance for more than ten days after its issuance if the proportion of cocaine or eucaine or their salts to the total content of the prescription shall exceed one grain

to the fluid ounce, or, in the case of ointment, two grains to the ounce, unless on such certificate there shall be written by the physician issuing the prescription a statement that the use of the substance is necessary for a longer period, to be named in such statement. It shall be lawful for any physician duly registered and licensed to practice in the state of New York, after personal examination of a patient, to prescribe and himself dispense such substances to such patient, provided he shall execute and deliver the certificate required of a dispensing druggist or pharmacist.

(b) Such substances may lawfully be sold in the original package at wholesale by any manufacturer thereof to any other manufacturer thereof or to a wholesale dealer in drugs, and by any wholesale dealer in drugs to any other wholesale dealer in drugs or to a manufacturer thereof, provided such package shall be securely sealed and labeled as prescribed in this section, and provided a record of such sale shall be kept in the manner prescribed in this section by the person selling and the person purchasing said substances. It shall be lawful for a manufacturer or wholesale dealer in drugs after the purchase in bulk of such substances, to repack the same in other containers which shall be sealed and labeled as prescribed in this section. When so repacked, sealed and labeled such containers shall, for the purposes of this section, be deemed to be original packages.

(c) Such substances may lawfully be sold in the original package to a licensed pharmacist, licensed druggist, duly registered practicing physician, licensed veterinarian or licensed dentist by any manufacturer of such substances or wholesale dealer in drugs upon the written order of the pharmacist, druggist, physician, veterinarian or dentist to whom the sale is made, provided such package shall be securely sealed and labeled and provided a record of such sale shall be kept in the manner prescribed herein by the person selling and the person purchasing such substance.

(d) Before making any sale provided for in paragraphs (b) and (c) of this section, the manufacturer of such substances or wholesale dealer in drugs shall affix or cause to be affixed to the bottle, box, vessel or package containing the article sold, and upon the outside wrapper of the package as originally put up, a label distinctly displaying the name and quantity of cocaine or its salts, alpha or beta eucaine or their salts sold, and the word "poison" with the name and place of business of the seller all printed in red ink.

(e) The manufacturer of such substances or wholesale dealer in drugs shall, before the delivery of any of such substances sold by him, make or cause to be made in a book kept for the purpose, an entry of the sale thereof, stating the date of sale, the quantity sold, the name and form in which it is sold, the name and address of the purchaser, the name of the person by whom the order is filled, the name of the person by whom the entry is made, a description of the package or container in which the substance is sold, and a statement that such substance was sold and purchased in the original package, that the package was sealed, that the seals thereof were undamaged and unbroken, and that the labels were attached thereto as hereinbefore prescribed, and were not in any manner defaced or damaged, and a statement showing how delivery was made, whether personally or by mail, express, freight or messenger. The record and statement thus made in such book shall be signed by the person filling such order for such substance and may

be received in any court against the person filling such order and the person selling such substance as evidence of the transaction recorded and the facts stated therein. The said book and record shall be kept in the regular place of business in the state of New York of such manufacturer and wholesale dealer and shall be open at all times for inspection by the officers or authorized agents of the state or local board of health, the New York state board of pharmacy and by the police authorities and officers charged with the enforcement of the penal law, and shall be preserved for at least five years after the date of the last entry made therein. The items in such book respecting the sale of said substances shall be consecutively numbered, and upon the receipt by such manufacturer or wholesale dealer of any order for any of such substances there shall be written or stamped upon such order so received the serial number corresponding to the next open numbered entry space in such record book and the said serial number shall also be written or stamped upon the package containing such substances when the same is delivered in pursuance of the said order. Such original orders shall likewise be kept by the said manufacturer or wholesale dealer in a convenient place in the state of New York; and shall be preserved for at least five years after the dates of such orders.

(f) The manufacturer of such substances or wholesale dealer in drugs, licensed pharmacist, licensed druggist, duly registered practicing physician, licensed veterinarian, or licensed dentist shall, upon the delivery to him of any of such substances purchased by him, make or cause to be made in a book kept for the purpose, an entry of the purchase thereof, stating the date of purchase thereof, the quantity purchased, the name and form in which it was purchased, the name and address of the seller, the name of the person by whom the purchase is made, the name of the person by whom the entry is made, a description of the package or container in which the substance is purchased, and a statement that such substance was sold and purchased in the original package, that the package was sealed, that the seals thereon were undamaged and unbroken, and that the labels were attached thereto as hereinabove prescribed, and were not in any manner defaced or damaged, and a statement showing how delivery was made, whether personally or by mail, express, freight or messenger. There shall also be recorded in such book the particular place in which such substance so purchased is to be kept by the purchaser, which place shall be easily accessible and shall be within the state of New York and shall not be changed except that at the time of such change an entry thereof be made in such book opposite the original entry of the purchase and signed by the purchaser. The record and statement thus made in such book shall be signed by the person purchasing such substance and may be received in any court against the person receiving such substance and against the person to whom the same is sold as evidence of the transaction recorded and the facts stated therein. Such book and record shall be kept in the regular place of business in the state of New York of such purchaser, and shall be open at all times for inspection by any prosecuting officer in the state or his subordinates and by such persons as may be designated by him. Such book shall be preserved for at least five years after the date of the last entry made therein.

(g) Any person who shall sell, offer to sell, furnish, dispose of or give away alkaloid cocaine or its salts or alpha or beta eucaine or their salts or any admixture, compound, solution or product of which cocaine or eucaine or their salts may be

an ingredient, except under the conditions and to the persons authorized by this section shall be guilty of a felony. Any dentist, veterinarian or physician who shall dispense such substances to a patient without issuing the certificate required by paragraph (a) to be made and issued by him shall be guilty of a felony. Any druggist or pharmacist who shall fill any prescription issued in violation of this section shall be guilty of a felony.

(h) Any person other than a manufacturer of such substances or a wholesale dealer in drugs or a licensed pharmacist, licensed druggist, duly registered practicing physician, licensed veterinarian or licensed dentist who shall possess any quantity whatever of alkaloid cocaine or its salts or alpha or beta eucaine or their salts or any admixture, compound, solution or product of which cocaine or eucaine or their salts may be an ingredient, shall be guilty of a misdemeanor, unless the said possession is authorized by the certificate described in paragraph (a.)

(i) Any licensed pharmacist, licensed druggist, duly registered practicing physician, licensed veterinarian or licensed dentist or manufacturer of such substances or wholesale dealer in drugs, who shall possess any quantity whatever of alkaloid cocaine or its salts or alpha or beta eucaine or their salts, or any admixture, compound, solution or product of which cocaine or eucaine or their salts may be an ingredient, in any place other than the place scheduled in the record herein provided for, shall be guilty of a misdemeanor, except that a duly registered practicing physician, licensed veterinarian or licensed dentist, may carry such substances for use in his profession, provided the amount so personally carried and the amount kept in the place scheduled in his record shall not together exceed a total of one and one-eighth ounces of such substance. Any person who shall under the provisions of this section be required to record the possession, disposition, sale, purchase or the place of keeping of such substances who shall fail to record the possession, disposition, sale or purchase thereof or the place in which the substances so possessed or purchased are kept, in the manner and after the form prescribed in this section, shall be guilty of a misdemeanor.

(j) Every manufacturer of such substances, wholesale dealer in drugs, licensed pharmacist, licensed druggist, duly registered practicing physician, licensed veterinarian and licensed dentist shall keep an accurate record in a book kept for that purpose of all alkaloid cocaine or its salts or alpha or beta eucaine or their salts or any admixture of cocaine or eucaine disposed of by him, and the possession in the place designated in the record herein directed by paragraph (e) to be kept of an amount less than the difference between the total amount received by him and the amount shown by his record to have been disposed of, shall be presumptive evidence of a sale of the amount of such substances not accounted for in violation of this section. No record of dispositions of such substances need be made by any physician, veterinarian or dentist, except that such persons shall at least once in each six months record the gross amount of such substances disposed of by him.

(k) Within thirty days after this section takes effect every manufacturer of alkaloid cocaine or its salts or alpha or beta eucaine or their salts, or any admixture, compound, solution or product in which cocaine or eucaine or their salts may be an ingredient, every wholesale dealer in drugs, licensed pharmacist, licensed druggist, duly registered practicing physician, licensed veterinarian and licensed dentist shall make a record of the amount of each of said substances possessed by

him in a book to be kept for that purpose, which may be the book in which purchases are recorded. Such book shall be kept at the regular place of business of each of said persons in the state of New York, and there shall be specifically stated in such book the amount of each of said substances possessed by the person making the record and the particular place in which the same is kept. Such book shall be open to inspection by any prosecuting officer in the state or his subordinates and by such persons as may be designated by him. Such book and record shall be preserved for at least five years after the date of the last entry made therein. In the event that the amount of said substances possessed at the time this section takes effect by any licensed pharmacist, licensed druggist, duly registered practicing physician, licensed veterinarian or licensed dentist, shall exceed the amount specified in paragraph (1) of this section, such possession shall not be deemed unlawful provided that the persons possessing the same shall not purchase or acquire in any manner whatever any more of such substances until the amount on hand shall be reduced by lawful disposition thereof to an amount less than that prescribed by paragraph (1.) If any of the persons entitled to possess such substances in any amount shall possess an amount in excess of that authorized by paragraph (1) it shall be the duty of each of such persons to report in writing to the state department of health, within thirty days after this act takes effect, the amount of each of such substances possessed by him and the place where the same is kept. Such reports shall be alphabetically filed in the office of the state department of health and shall be open to public inspection. Any person violating the provisions of this paragraph of this section shall be guilty of a misdemeanor.

(1) It shall be unlawful to possess or have in any pharmacy or drug store in this state more than one and one-quarter ounces of alkaloid cocaine or its salts or alpha or beta eucaine or their salts for each duly registered pharmacist or druggist regularly employed in such pharmacy or drug store, provided, however, that in no event shall there be carried in stock in such pharmacy or drug store to exceed five ounces of such substances no matter what number of registered pharmacists or druggists may be employed therein. It shall be unlawful for any physician, dentist or veterinarian to possess more than one and one-eighth ounces of alkaloid cocaine or its salts or alpha or beta eucaine or their salts. Any person who shall violate any of the provisions of this paragraph shall be guilty of a misdemeanor.

(m) This section shall not apply to nor prohibit the regular and ordinary transportation of such substances as merchandise, provided the same shall be labeled and sealed as prescribed in this section, nor to the possession of such substances by duly authorized officials charged with the enforcement of the law when such substances are possessed by them in pursuance of their official duties and in connection with the apprehension and prosecution of persons offending against this section.

(n) It shall be lawful for one person in the regular employ of each public hospital or dispensary in this state, to be selected and designated by the managers or board of trustees of such hospital or dispensary to purchase and possess alkaloid cocaine or its salts or alpha or beta eucaine or their salts, provided such purchase and possession shall be for the exclusive use of such hospital or dispensary and provided that such substances shall be kept within the hospital buildings or

dispensary. The amount of such substances so possessed shall not exceed five ounces at any one time, and the person so designated by such managers or trustees of such hospital or dispensary shall keep the same record of purchases and dispositions as is hereinabove directed to be kept by other persons purchasing and possessing cocaine or eucaine or their salts, and he shall be liable to the same penalties as hereinabove provided. The record directed herein to be kept shall be open to inspection by the same authorities as are hereinabove provided, and the record shall be preserved in such hospital or dispensary for at least five years after the date of the last entry made therein.

§ 3. This act shall take effect immediately.

OHIO NARCOTIC LAW OF 1913.

Sec. 12672. Whoever sells, barter, furnishes or gives away, directly or indirectly, or has in his possession for the purpose of selling, bartering, furnishing or giving away, any quantity of cocaine, alpha or beta eucaine or alypin, * * * morphine, acetyl-morphine, di-acetyl-morphine, di-acetyl-ester-morphine, ethyl-morphine, opium, or any of their alkaloids, salts, derivatives or compounds, or any synthetic equivalent thereof either as to the physical properties or physiological action, except upon the original written prescription of a physician duly licensed under the laws of this state, which prescription shall contain the name of the physician issuing it, the date of issue and the name of the person for whom it is issued; or fails to keep such prescription on file for at least two years, in such manner that it is accessible at all reasonable times to the inspection of the proper officer or officers of the law and the members of the state board of pharmacy and the secretary of the state board of pharmacy, or fills said prescription more than once, shall be fined not less than twenty-five dollars, nor more than five hundred dollars, or imprisoned in the county jail not less than thirty days or more than six months, or both at the discretion of the court, for the first offense, and for each subsequent offense shall be imprisoned not less than one year or more than five years in the penitentiary. If it be made to appear to the court that the person so convicted is addicted to the use of any of the above mentioned drugs or substances, the court, with the consent of such person may commit such person to a hospital or other institution for the treatment of such person. This section does not extend to sales at wholesale of any quantity of the above mentioned drugs to duly registered pharmacists physicians, dentists, or veterinary surgeons, and shall not apply to liquid preparations sold in good faith as medicines containing not more than two grains of opium, or not more than one-fourth grain of morphine, or not more than one-fourth grain of heroin, or not more than one-eighth grain of alpha or beta eucaine, or not more than ten grains of chloral hydrate in one fluid ounce, or if a solid preparation in one avoirdupois ounce.

Sec. 12672-1. The finding in the possession of a person who is not a wholesale dealer in drugs, a registered pharmacist, physician, dentist or veterinary surgeon, of any quantity of cocaine, alpha or beta eucaine or alypin, morphine, acetyl-morphine, di-acetyl-morphine, di-acetyl-ester-morphine, ethyl-morphine, opium, or any of their alkaloids, salts, derivatives, or compounds, or any synthetic equivalents thereof, either as to the physical properties or physiological action shall be prima facie evidence of the violation by such person of section 12672 of this chapter.

Section 3. That said original Section 12672 and 12674 of the General Code be, and the same are hereby repealed.

[Effective August 6, 1913.]

THE DEFEATED NARCOTIC BILL OF PENNSYLVANIA.

Section 1. Be it enacted by the Senate and House of Representatives of the Commonwealth of Pennsylvania in General Assembly met and it is hereby enacted by the authority of the same. That it shall be unlawful for any person firm or corporation to sell furnish give away or deliver any opium morphine heroin codeine their salts derivatives or compounds or any substances or preparation containing opium heroin morphine codeine or their salts derivatives or compounds except upon the bona fide written prescription of a duly registered practitioner of medicine dentistry or veterinary medicine which prescription shall be filled but once and of which no copy shall be taken by anyone and which shall be retained and kept on file by the dispenser thereof for a period of at least five years and be open to inspection at all times by the prescriber and properly authorized officers of the law or agents of the State Pharmaceutical Examining Board provided that any such prescription may be refilled upon the written order of the original prescriber.

Provided that the provisions of this section shall not apply to sales made by any manufacturer of drugs or chemicals wholesale druggists or owner of a pharmacy to another manufacturer of drugs or chemicals wholesale druggist or owner of a pharmacy or to hospitals colleges scientific or public institutions or Practitioners of Veterinary Medicine nor to the sale or dispensing by registered pharmacists of written prescriptions of registered physicians dentists or veterinarians if such prescriptions contain not more than two grains of opium or not more than one-fourth grain of morphine or not more than one-third grain of heroin or not more than one grain of codeine or not more of any salt or derivative of opium morphine heroin or codeine in the proportion herein named for the drug from which such salt or derivative is prepared in one fluid ounce or if a solid preparation in one troy ounce nor to the sale or dispensing of prescriptions for plasters liniments and ointments containing any drug or derivative thereof herein named when prescribed for external use only nor to the sale of cough remedies proprietary medicines or other medicinal preparations provided they are sold as medicines and not for the purpose of evading the provisions of this act of Assembly or supplying habitues to the use of opium morphine heroin codeine their salts derivatives or preparations with any of these drugs if they contain not more than two grains of opium or not more than one-fourth grain of morphine or not more than one-third grain of heroin or not more than one grain of codeine or not more of any salt or derivative of opium morphine heroin or codeine in the proportion herein named for the drug from which such salt or derivatives prepared in one fluid ounce or if a solid preparation in one avoirdupois ounce and not more than one of the drugs or more than one of any salt or derivative of any drug herein named nor to the sale of plasters liniments and ointments containing any drug herein named when prepared and sold for external use only nor to the sale of paregoric brown mixture brown mixture tablets compound syrup of white pine compound syrup of white pine tar Dewee's carminative Dalby's carminative Bateman's drops

Godfrey's cordial Dover's powder sun cholera mixture Squibb's diarrhoea mixture or Warburg's tincture nor to the sale of any compound mixture or preparation into which any drug or any derivative of any drug named in this section of this act of Assembly may enter provided such compound mixture or preparation contains sufficient of another ingredient or other ingredients as to render it unfit for use by an habitual user of any drug or drugs to which this act of Assembly applies.

And provided also that before delivering any of the articles or within twenty-four hours thereafter there shall be made in a book kept for the purpose an entry of the sale thereof stating the date of sale the quantity name and form in which sold the name and address of the purchaser and whether said purchaser is a wholesale druggist or owner of a pharmacy manufacturer of drugs or chemicals or practitioners of veterinary medicine and the said book shall be always open for inspection by the proper authorities and shall be preserved for a period of five years after the last entry therein.

And further it shall be the duty of all dealers in drugs and manufacturers to make monthly reports to the State Pharmaceutical Examining Board of their sales of all articles to which this act of Assembly applies excepting articles sold or dispensed upon prescription of a registered practitioner of medicine dentistry or veterinary medicine in such form as may be required and upon blanks to be provided by said State Pharmaceutical Examining Board Every practitioner of medicine who prescribes or administers or dispenses any of the drugs to which this act of Assembly applies for the use of any person known to him as an habitual user of any such drugs when such prescribing administering or dispensing is for the cure of a drug habit shall keep a record of the name age and address of the person the name and quantity of the drug so prescribed or administered and report the same in monthly reports to the State Pharmaceutical Examining Board.

Section 2. That no practitioner of medicine dentistry or veterinary medicine shall prescribe sell or furnish opium morphine codeine heroin their salts compounds derivatives or preparations for the use of any person known to him as an habitual user of the same nor shall any practitioner of dentistry prescribe any of the foregoing substances for any person not under his treatment in the regular practice of his profession nor shall any practitioner of veterinary medicine prescribe any of the foregoing substances for the use of any human being Provided however that the provisions of this act of Assembly shall not be construed to prevent any duly registered practitioner of medicine from administering or dispensing to any person or prescribing in good faith for the use of any habitual user of narcotic drugs who is under his professional care such substances as he may deem necessary for his treatment when the same are not administered dispensed or prescribed for the purpose of evading the provisions of this act of Assembly or perpetuating the habitual use of any of the articles subject to the provisions of this act of Assembly by any habitual user thereof.

Section 3. That any person who shall violate any of the provisions of this act of Assembly shall be guilty of a misdemeanor and for each offense upon conviction thereof shall be sentenced to pay a fine of not more than five hundred (\$500.00) dollars and undergo an imprisonment of not more than two years in the county prison or either or both at the discretion of the court.

Section 4. That it shall be unlawful for any person who is not a practicing physician dentist or veterinarian or manufacturing chemist or analytical chemist or manufacturing pharmacist or wholesale druggist or owner of a pharmacy or manufacturer of proprietary or patent medicine or for any educator or instructor or investigator in any recognized educational or scientific institution to have in his possession any opium morphine heroin codeine or their salts derivatives or compounds or any patent or proprietary medicine containing opium morphine heroin codeine or their salts derivatives or compounds in such form or quantity as to make the same subject to the provisions of this act of Assembly except by reason of a prescription of a registered practitioner of medicine dentistry or veterinary medicine and any person violating the provisions of this act shall be guilty of a misdemeanor and upon conviction thereof be sentenced to pay a fine of not more than fifty dollars (\$50.00) and undergo an imprisonment of not more than six months or either or both at the discretion of the court.

Section 5. That it shall be the duty of the State Pharmaceutical Examining Board to enforce the provisions of this act who shall receive as compensation for their services the sum of twelve hundred dollars (\$1200) per annum which shall be in lieu of all compensation allowed them by law They shall be allowed their necessary expenses incurred in the enforcement of the provisions of all acts which they may be authorized to enforce The compensation and expenses shall be paid quarterly by the State Treasurer on the certificate of the secretary of the said board and upon warrant of the Auditor General The said board is hereby authorized to employ such agents attorneys and assistants as may be necessary in enforcing the provisions of this act All fines and penalties imposed and recovered for violations of the provisions of this act shall be paid forthwith to the secretary of the said board or his agent and by him immediately paid into the State Treasury for the use of the Commonwealth.

Section 6. That the sum of twenty-five thousand dollars or so much thereof as may be necessary be and hereby is appropriated for enforcing the provisions of this act to be paid out of the State Treasury upon warrants duly signed by the secretary of the State Pharmaceutical Examining Board and upon warrant of the Auditor General.

Section 7. The provisions of this act shall not apply to the sale of any patent or proprietary remedy containing opium morphine heroin codeine or any salt derivative compound or preparation of the same by any dealer which were in such dealer's stock in this State at the time of approval of this act Provided That the package or other container in which the remedy shall be contained shall be plainly and distinctly marked "On Hand"_____ (date of approval.)

Section 8. That all acts and parts of acts inconsistent herewith be and hereby are repealed.

UTAH NARCOTIC LAW OF 1913.

1727x2. It shall be unlawful for any person, firm, association or corporation to sell or otherwise dispose of or have possession of cocaine, morphine, heroin, codein, alpha eucaine, beta eucaine, nova-caine or opium, or any of the derivatives of opium, except upon the prescription of a reputable licensed practicing physician, licensed dentist or licensed veterinary surgeon, and said prescription shall not be refilled, which prescription shall be dated and shall contain the name of

the person for whom prescribed written in by the person writing said prescription and if prescribed by a veterinary surgeon it shall state the kind of animal for which ordered, and every prescription shall be signed by the person giving the same, provided, that the above provisions shall not apply to possessions by or sales at wholesale by jobbers, wholesalers, and manufacturers to retail druggists, nor to possession by or sales at retail by retail druggists to a regular reputable licensed practicing physician, dentist or veterinary surgeon, nor to sales made to or possession by manufacturers of proprietary or pharmaceutical preparations for use in the manufacture of said preparations, nor to sales to or possession by hospitals, colleges, scientific or public institutions; and provided, further, that the above provisions shall not apply to such preparations as are recognized by the United States Pharmacopoeia or to standard proprietary remedies: Provided, further, that no practitioner of medicine, dentistry, or veterinary medicine shall furnish to or prescribe for the use of any habitual user of the same any cocaine, morphine, heroin, codeine, alpha eucaïne, beta eucaïne, nova-caine or opium, or any of the derivatives of opium, or any salt or compound of any of the foregoing substances, or any preparations containing any of the foregoing substances or their salts or compounds; and no practitioner of dentistry shall prescribe any of the foregoing substances for any person not under his treatment in the regular practice of his profession, and no practitioner of veterinary medicine shall prescribe any of the foregoing substances for the use of any human being, provided, however, that the provisions of this section shall not be construed to prevent any lawfully authorized practitioner of medicine from administering in good faith, for the use of any habitual user of narcotic drugs, who is under his professional care, such substances as he may deem necessary for his treatment, when such administration is not for the purpose of evading the provisions of this act. Provided, further, that all such wholesale jobbers, wholesalers and manufacturers in this Section mentioned shall before delivery of any of the articles in this section enumerated make or cause to be made in a book kept for that purpose only, an entry of the sale of any such article stating the date of such sale and quantity and name of the article and form in which sold, the true name and true address of the purchaser, the name of the person by whom such entry and sale was made, also a statement showing how delivery was had, whether delivered personally or forwarded by mail, express or by freight, which book shall be substantially as follows:

Date of Sale	Quantity and Name of Article	Name of Purchaser	How Delivered	Name of Person Selling
--------------	------------------------------	-------------------	---------------	------------------------

and said book shall always be open for inspection by any peace office or any member of the board of pharmacy or any inspector by them authorized, and such book shall be preserved for at least five years after the date of the last entry therein.

The possession of pipes used for smoking opium, (commonly known as opium pipes), and the usual attachments thereto, is hereby made a misdemeanor.

All narcotic drugs specified in this section and also all pipes used for smoking opium (commonly known as opium pipes) and the usual attachments thereto, seized under the provisions of this act, shall be ordered destroyed by the judge of the court in which final conviction was had; said order of destruction shall contain the name of the officer charged with the duty of destruction as herein required.

1727x3. Any person, firm or association or corporation violating any of the provisions of this chapter, except as otherwise provided, shall be deemed guilty of a felony and shall be punished by imprisonment in the state prison for not less than one month and not more than five years, or by a fine of not less than one hundred dollars (\$100.00) and not more than five thousand dollars (\$5,000.00) or by both such fine and imprisonment.

Section 2. This act shall take effect upon approval.

Approved March 14, 1913.

WYOMING NARCOTIC LAW OF 1913.

Section 2907. Except as hereinafter provided it shall be unlawful for any person, whether acting for himself or as agent, to possess, or sell or otherwise dispose of cocaine, eucaine, beta eucaine, alpha eucaine, morphine, heroin, chloral, chloral hydrate, Indian hemp, opium, or any salt, compound or derivative thereof, except upon the prescription of a licensed practicing physician registered in this State. No person filling the prescription shall refill the same nor give any copy thereof to the party presenting said prescription. The said prescription shall be kept on file and open to inspection by the State Board of Pharmacy Commission, City or County authorities, or of the State Board of Medical Examiners, at any time, provided that the above provisions shall not apply to sales at wholesale, by jobbers, wholesalers and manufacturers to retail druggists, nor to sales at retail by retail druggists to regular licensed practicing physicians registered in this State, or dentists or veterinary surgeons registered in this State, nor to sales to State, County or private hospitals. And provided, further, that the above provisions shall not apply to such preparations as are recognized by the United States Pharmacopœia or National Formulary, or pharmaceutical preparations to be used in the filling of prescriptions written by a regular registered practicing physician in this State."

Section 2. That Section 2908 of the Wyoming Compiled Statutes of 1910 be and the same is hereby amended and re-enacted to read as follows:

"Section 2908. Any person found guilty of any violation of the provisions of Section 2907 or 2909 of the Compiled Statutes of Wyoming of 1910, shall be deemed guilty of a felony and shall be fined not less than \$500.00 nor more than \$1,000.00, or imprisoned in the State Penitentiary for a term of not less than one year nor more than three years, or punished by both such fine and imprisonment in the discretion of the court."

Section 3. That Section 2909 of the Compiled Statutes of Wyoming, 1910, be and the same is amended and re-enacted to read as follows, to-wit:

"Section 2909. No practitioner of medicine, druggist, or veterinary medicine

shall furnish to or prescribe for the use of any habitual user of the same, any cocaine, eucaïne, beta eucaïne, alpha eucaïne, morphine, chloral, chloral hydrate, Indian hemp, opium, or any salt or compound of any of the foregoing substances, or preparation containing any of the foregoing substances, to any person not under his treatment in the regular practice of his profession, and no practitioner of veterinary medicine shall administer any of the foregoing substances to any human being. Provided, however, that the provisions of this section shall not be so construed as to prevent any lawfully authorized practitioner of medicine from prescribing or administering in good faith, cocaine not exceeding 2 grains to any one person within the period of 24 consecutive hours; morphine not to exceed 4 grains to any one person within the period of 24 consecutive hours; codeine, Indian hemp, eucaïne, alpha eucaïne, beta eucaïne, opium or any of its derivatives, not to exceed 4 grains within any consecutive period of 24 hours; chloral not to exceed 30 grains within any consecutive period of 24 hours. Provided, that the provisions of this act shall not be so construed as to prevent the use of the foregoing substances in hospitals in any quantity deemed necessary by the attending physician when such administration is not for the purpose of evading the provisions of this act. When any physician shall administer or prescribe in excess of the dosage of drugs mentioned in this section, within any 24 hours, he shall within 5 days make a report of such action to the Secretary of the State Board of Health, stating fully name of patient and conditions under which drugs were administered or prescribed. It shall be the duty of the State Pharmacy Commission to enforce these sections."

Section 4. This act shall take effect and be in force from and after its passage.
(To be continued)

· ADVERTISING NEGATIVELY.

There is a strong temptation at all times to tell in your advertising space certain things that you do not sell or that you do not do in your store. Most of these things might better be left unsaid. Some druggists advertise that they have no connection with any chain of stores. That this is true is no recommendation to the people who are habitually buying from those stores. In fact the patrons of the chain stores will construe it as rather a slap at them and it will work to make them less rather than more inclined to patronize the advertiser. Its effect on the people who already do not buy of the chain stores may not be to send them there, but it at least will have the tendency to make them give more thought to those stores. Other druggists claim they do not sell certain lines of goods they say are "trust made." Well, what does the man who likes those "trust made" goods care about the trust part of it? He wants the goods and he certainly will not go for them to the store that boasts it does not handle them. As for the man who does not use those goods, there is certainly no advantage in mentioning them to him in any way at all. To advertise that you do not do or sell any particular thing is rarely a recommendation. Negative advertising rarely produces a positive result in trade development.—*The Spatula*.

Section on Practical Pharmacy and Dispensing

Papers Presented at the Sixty-First Annual Convention

SOME DISPENSING HINTS.

FRANKLIN M. APPLE, PHAR. D., PHILADELPHIA.

The following dispensing hints are submitted with a realization of the fact that they may not be new to all of our members, but believing that at least some one may be thankful for one of these suggestions, they are offered for what merit they may possess.

Excipient for Nitrate of Silver Pills.—When dispensing nitrate of silver in pill form, whether prescribed alone or in combination with other medicinal agents, we had used for years, as an excipient, a petroleum residuum, sold by one of the large manufacturing houses; but as the product obtainable of late was not satisfactory, we experimented with various combinations of unctuous substances and decided that the mass resulting from a combination of one part hard paraffin and five parts petrolatum gave the best results.

If the amount of the medicinal agents prescribed is small, it is advisable to add thereto a sufficient amount of powdered althea to make the finished pill about the size of a one (1) grain quinine pill.

No unpleasant odor attaches to this excipient, as is associated with resin cerate; and our medical friends report very satisfactory results from the administration of pills made in this manner.

Charcoal for Children.—Every practical pharmacist well knows the difficulty that attends the administration of charcoal, in powder form, to children (and to many adults); and as we are supposed to serve as pharmaceutic advisers to the medical men, will suggest that your medical friends be made acquainted with the possibility of administering charcoal in powder form by using the crushed charcoal tablets. These can readily be triturated with other medicinal agents and administered without the need of using syrup, honey or some similar heavy fluid, with their drawbacks, owing to the possibilities of fermentation of the sugars contained therein. Very satisfactory results have been obtained in the cases where this method has been used.

Difficulty Experienced with Methyl Salicylate.—We recently had annoying experiences with a lot of methyl salicylate, when dispensed in combination with liniment of camphor and iodine. We had repeatedly dispensed this combination without any complaint being registered by the physician writing the prescription, but after replenishing our supply of methyl salicylate, we encountered objections from the prescriber, as the mixture would become decolorized in a short period of time, indicating absence of free iodine. A series of experiments proved that

it was not due to the liniment of camphor; hence we suggested the substitution of oil of betula for the methyl salicylate and our troubles were at an end. If you wish to use methyl salicylate in combination with iodine would suggest that it be tested first for its iodine absorption value, so as to avoid possible subsequent controversies and explanations.

Home-made Dusting Boxes.—Occasionally we are called upon to dispense small quantities of medicinal agents in a sifting-top box, and as it is desired to concentrate the siftings upon a small space upon the body, we have found it expedient to manufacture the sifting-top boxes extemporaneously by punching the necessary holes in a round utility box with an awl of small size, holding against the under side of the lid a section of a broom handle sawed off at right angles. By placing the label upon the box so as to cover the junction point of the top and of the body of the box (a shouldered one only should be used) there is no danger of the lid being shaken off, with its unpleasant results.

ONE CAUSE OF INSTABILITY IN COMPOUND SYRUP OF THE PHOSPHATES, N. F.

SAMUEL T. HENSEL, PH. G., DENVER, COLO.

When the method of procedure of the National Formulary is rigidly followed in the preparation of this syrup, the product will after a short time become cloudy, finally throwing down a precipitate—the time required varying with the order in which the ingredients are added in making the initial solution of calcium carbonate.

By referring to the N. F. formula it will be observed:

First. That the amount of glycerin employed is very great compared with the aqueous solvent.

Second. In the preparation of the initial solution containing the calcium carbonate, glycerin is the first in the order named, followed by the addition of a comparatively small amount of orange flower water.

If the glycerin is first added to the calcium carbonate, citric acid, potassium bicarbonate, sodium bicarbonate, etc., solution is extremely slow, the mass in the meantime swelling up to an enormous volume, carbon dioxide being expelled very slowly, and owing to the viscosity of the liquid a large percentage of the gas is held in suspension.

If, on the other hand, the orange flower water be first added to the calcium carbonate, citric acid, etc., solution is effected very rapidly, a large portion of the carbon dioxide being expelled at once.

In either case, however, whether we add the glycerin or the orange flower water first, the result will finally be the same, there will be a precipitation of the calcium salt.

Third. By further inspection of the formula, we note that the amount of hot water (8 fluidounces) directed for the solution of the ferric phosphate and ammonium phosphate, is very largely in excess of the amount necessary to dissolve these two very soluble salts. Three fluidounces of hot water would be

sufficient for the solution of these two salts, the other five fluidounces becoming available in effecting the solution of the calcium carbonate, etc.

For a long time I have been confirmed in the belief that the deposit found in this syrup was chiefly calcium carbonate, and that it was to the large amount of carbon dioxide held in suspension by the viscosity of the liquid to which the precipitation is due.

When the glycerin and the orange flower water are added, the viscosity of the resulting mixture is such as to retard the complete elimination of the carbon dioxide set free, and since the coefficient of solubility of carbonic acid is a constant for a given temperature, a definite amount of the acid will be held in solution in its most chemically active state, i. e., in the form of H_2CO_2 .

According to Mendeleeff, the coefficient of solubility of carbonic acid, that is to say, the number of grams by weight saturating 100 grams of water, is for the three different temperatures here given, as follows:

0° C.	20° C.	100° C.
35	18

In other words, at 100° C. carbon dioxide ceases to exist in aqueous solution.

Now, carbonic acid, although a weaker acid than either the citric or phosphoric acids, possesses a strong affinity for calcium and is capable of completely overcoming the excess of the two named acids, hence its tendency is to combine with the calcium to form calcium carbonate.

A short time ago, I made a tentative examination of a deposit found in a syrup which had been prepared for some time.

On first examination, the deposit proved insoluble in both hot and cold water.

I then treated it with diluted hydrochloric acid; solution was immediately effected, accompanied by brisk effervescence, indicating the presence of a carbonate.

I then determined to try my idea of modifying the method of procedure in the preparation of the initial solution of the calcium carbonate by utilizing the five fluidounces of surplus water referred to above, and bringing the mixture to a temperature of 212° F., so as to completely eliminate the last vestige of the liberated carbon dioxide.

The calcium carbonate, citric acid, potassium bicarbonate, sodium bicarbonate, were introduced into a porcelain capsule, five fluidounces of distilled water were added and the mixture brought to the temperature of 212° F., and the glycerin, orange flower water and tincture of cudbear, were then added in the order named. The temperature of 212° F. should not be exceeded, nor prolonged beyond the time necessary for solution, or calcium citrate will be precipitated.

Solution of the ferric phosphate and ammonium phosphate was then accomplished by means of the remaining three fluidounces of hot water, this solution added to the initial solution and the resulting mixture filtered, the sugar added, and the whole agitated until solution was effected, in the manner directed in the National Formulary.

The result was a stable syrup, showing no sign of change after a month's storage under ordinary conditions.

THE LINIMENTS OF THE U. S. P. AND THE NATIONAL FORMULARY.

THOMAS LATHAM, NEW YORK.

The U. S. P. contains eight formulas for liniments, the N. F. an equal number. Though comparatively unimportant as medicinal agents, liniments are frequently dispensed and would long since have been discarded from works of authority were they considered by the medical profession to be entirely useless. I will not attempt a classification of liniments from the point of view of the physician, nevertheless the pharmacist must possess a certain knowledge of their effect when applied to the skin so as to avoid misadventure in their use.

LINIMENTUM AMMONIÆ, U. S. P.

Ammonia Water	350 cc.
Alcohol	50 cc.
Cotton Seed Oil.....	570 cc.
Oleic Acid	30 cc.

Suggested formula:

Ammonia Water	400 cc.
Liq. Paraffin Oil.....	550 cc.
Oleic Acid	50 cc.

The latter remains a constant emulsion, never congealing as when made with vegetable oils. The alcohol is not needed to maintain liquidity.

LINIMENTUM BELLADONNÆ, U. S. P.

Camphor	50 grams
Fluidextract Belladonna Root, to make.....	1000 cc.

Suggested formula:

Camphor	37.5 grams
Lin. Saponis	250 cc.
Fl. Ext. Bellad. Root, to make.....	1000 cc.

More lubricant than the U. S. P., therefore easier to apply, and the camphor is in better solution. This liniment is rarely used alone.

LINIMENTUM CALCIS, U. S. P.

The title of liniment scarcely describes this valuable compound, much used under the name of Carron Oil. The lime water should be of the best and placed in the bottle first. On adding the linseed oil in exactly equal volume emulsification takes place at once.

LINIMENTUM CAMPHORÆ, U. S. P.

Camphor, in coarse powder.....	200 grams
Cotton Seed Oil.....	800 grams

Improved by using yellow paraffin oil at one-third the price of cotton seed oil. There is no valid reason for retaining the cotton seed oil.

LINIMENTUM CHLOROFORMI, U. S. P.

Chloroformi	330 cc.
Soap Liniment	700 cc.

Too strong in chloroform and too expensive for general sale.

Suggested formula:

Chloroform	200 cc.
Methyl Salicylate	50 cc.
Paraffin Oil, colorless.....	750 cc.

May be colored if desired with soluble anilin green.

LINIMENTUM SAPONIS, U. S. P.

Soap, dried and granulated.....	60 grams
Camphor	45 grams
Oil Rosemary	10 cc.
Alcohol	725 cc.
Water to make.....	1000 cc.

The directions are to heat the soap on a water bath with the water until a clear gelatinous mass results. To this the alcohol is to be gradually added, having had the other ingredients previously dissolved in it.

Suggested formula: Dissolve the soap in fine powder in the alcohol containing the other ingredients. Any bottle of sufficient capacity may be used and the operation conducted cold and finished in an hour or two. Filtration concludes it.

LINIMENTUM SAPONIS MOLLIS, U. S. P.

Soft soap	650 grams
Oil of lavender flowers.....	20 cc.
Alcohol to make.....	1000 cc.

Amended by using the cheap methyl salicylate instead of the dear oil of lavender with better covering effect. No need to use imported green soap (which, by the way, is never green), we now having most excellent domestic made with linseed oil at one-fourth the price.

LINIMENTUM TEREBINTHINAE, U. S. P.

Rosin cerate	650 grams
Oil of Turpentine.....	350 grams

Dissolve together with gentle heat.

Suggested formula: Use petrolatum flavum at a much lower price, instead of the rosin cerate, the only purpose of which is to dilute the oil of turpentine.

LINIMENTUM ACONITI ET CHLOROFORMI, N. F.

Fld. Ext. Aconite.....	45 cc.
Alcohol	80 cc.
Chloroform	125 cc.
Soap Liniment	750 cc.

This excellent liniment can be improved by the addition of menthol, 20 grams, in which combination it is a great favorite with physicians.

LINIMENTUM AMMONII IODIDI, N. F.

Iodine	4 grams
Oil Rosemary	15 cc.
Oil Lavender.....	32 cc.
Ammonia water	110 cc.
Alcohol, to make.....	1000 cc.

Suggested formula:

Ammonium Iodide	30.00
Soap Liniment	1000.00

LINIMENTUM IODI, N. F.

Can be considered obsolete, as in more than forty years' practice I have never dispensed it or heard of its being dispensed.

LINIMENTUM OPII COMP., N. F.

Tr. Opium	100	cc.
Camphor	17.5	grams
Alcohol	250	cc.
Oil Peppermint	25	cc.
Ammonia water	375	cc.
Oil Turpentine, to make.....	1000	cc.

On account of its high price and the comparative uselessness of its expensive ingredients, tincture opium and oil peppermint, the following is recommended:

Suggested formula:

Tr. Opium	10	cc.
Tr. Arnica	90	cc.
Camphor	20	cc.
Alcohol	250	cc.
Menthol	2	grams
Linseed Oil	50	cc.
Ammonia Water	400	cc.
Saponin	2	grams
Oil of Turpentine, to make.....	1000	cc.

Add the saponin, menthol and camphor to the alcohol, then the linseed oil and ammonia water, the other ingredients following. A fairly perfect emulsion results.

LINIMENTUM SAPONATO—CAMPHORATUM, N. F.

This old composition is retained chiefly for historical interest and I cannot remember selling it for thirty years. Opodeldoc Liquid, i. e., Soap Liniment, has taken its place; however, it may be made readily with any of the popular brands of white laundry soap which have a mixed base of cotton seed and cocoanut oil and readily solidify or jelly on cooling.

LINIMENTUM TEREBINTHINAE ACETICUM, N. F.

Oil of Turpentine.....	100	cc.
Fresh egg	1	
Oil Lemon	4	cc.
Acetic Acid	20	cc.
Rose Water	85	cc.

Suggested formula:

Oil of Turpentine.....	500	cc.
Water	500	cc.
Saponin	2	grams
Eggs	2	
Ess. Lemon 5%	75	cc.
Acid Acet.....	90	cc.

This deservedly popular liniment has stood the test of about 150 years' use, and when properly made is an elegant emulsion. Made by the present N. F. formula, it thickens on standing, needs shaking and often is difficult to pour out of a narrow-necked bottle.

LINIMENTUM TIGLI AND TIGLI COMPOSITUM, N. F.

In my experience these have never been used, and have never been in my stock. The oil alone is seldom prescribed; occasionally the physician orders it diluted with olive oil as he desires.

The author also recommends the following formulas as yielding preparations which give good satisfaction:

ANALGESIC LIQUID BALM.

Methyl Salicylate	30	cc.
Menthol	2	

"Our sales for Fluidextract Lactucarium have been as follows:

1910—67 pints.

1911—59 pints.

1912—52 pints.

"Our sales for Syrup Lactucarium Concentrated have been as follows:

1910—222 pints.

1911—181 pints.

1912—247 pints.

"The balance of the Lactucarium which we purchased was used in other pharmaceutical preparations which we supply under our label, or a portion of the drug may have been used in some of the preparations prepared through our Private Formula Department for certain customers.

"There is no question whatever in our minds but that the Syrup Lactucarium is admirably adapted and oftentimes prescribed for infants whenever a hypnotic or anodyne is required. This product is also recommended by some physicians for use in the treatment of nervous insomnia of adults."

From the second house, the following is stated:

"Only three preparations are made by this establishment, the Fluidextract, the Syrup and the Tincture. The sale on all of these is quite limited which may be, in part, due to the excessively high price of the drug, but we remember that, even in the past when the drug was considerably cheaper, than it now is, the sale was also restricted."

It would seem from the above that lactucarium has a very limited sale but, in our experience, lactucarium never did have much popularity. This was due largely to its disagreeable characteristics.

Syrup of lactucarium was introduced into the Pharmacopoeia in 1860. The preparations then made were unsatisfactory. In 1870, the formula produced a turbid, unsightly preparation with a very disagreeable odor and taste. In 1880, the syrup was made from the fluidextract which was, like the others, unsatisfactory, the resinous principles being thrown out of solution in the syrup, forming a turbid-looking preparation. In 1890, the tincture of lactucarium was used from which the resin was precipitated and filtered out through the medium of precipitated calcium phosphate, and the syrup made from the filtered liquid. In the 1900 formula, we have a much improved formula. The resinous principles are extracted first from the drug by petroleum ether. From the drug thus deprived of resin, the tincture is made and the syrup is made from it. This preparation has been a difficult one for pharmacists to make satisfactorily and many suggestions for improvement have been made.

That made by Mr. George F. Beringer seems to be of special value, which is as follows:

Lactucarium	50 gm.
Glycerin	250 gm.
Sugar	600 gm.
Stronger Orange Flower Water, q. s.	
Distilled Water, q. s., to make.....	1000 cc.

Beat the lactucarium with about 400 gm. clean sand to a coarse powder and place in a percolator, shaking down evenly but not packing. Put on sufficient of a mixture of the glycerin, orange flower water and 300 cc. distilled water to saturate and leave a layer above. Cork the percolator and cover, let macerate for two days; then percolate slowly, using the remainder of the menstruum,

then distilled water until 400 cc. of distillate is obtained, in this dissolve the sugar, heat on bath if necessary, strain, add water until 100 cc. is obtained.

This makes a beautiful, brownish-colored, agreeable tasting syrup which, owing to the glycerin in it, will keep indefinitely. Glycerin acts as a preservative and also solvent. The orange flower gives the product an agreeable odor as well as taste.

Some two years ago, with the aid of one of the students in the laboratory, a series of all of the preparations of syrup of lactucarium was made and these preparations have been kept in one-half pint bottles up to the present time. Added to the list including that of Mr. Beringer's, was a preparation of our own make which differed from his by substituting for the orange flower water q. s. of oil of anise. Just enough of the oil is used to be perceptible to the taste and odor. This preparation has a very agreeable odor, taste and appearance, and we consider that anise is a very much superior aromatic to that of orange flower for this syrup. Mr. Beringer's preparation furnishes a product that is medicinally, and pharmaceutically, a better preparation than the present U. S. P. article, and I believe should be substituted for it. I firmly believe that syrup of lactucarium should be officially recognized but, if the formula, as recommended by Beringer, be adopted, there is no occasion for the tincture being continued as official. Mr. F. W. Nitardy, of Denver, whose knowledge of the demand and value of pharmaceutical preparations in the west is unquestioned, writes:

The Syrup of Lactucarium should not be deleted from the Pharmacopœia. Its use in our territory is quite limited. A gallon of the syrup lasts about a year. I believe, however, that the drug is of value and should not be omitted from the U. S. P. because it does not enjoy a wide use.

The amount of a drug or preparation prescribed seems a rather poor criterion of its value at any rate—for example, we use about fifty gallons of Compound Syrup of Sarsaparilla, U. S. P., to one gallon of Syrup of Lactucarium. No one can say, however, that as a therapeutic agent the former can be compared to the latter. We should much prefer seeing this polypharmic preparation relegated to the N. F. and the Syr. Lactucarium retained if it is deemed advisable to reduce the number of preparations now in the U. S. P.

ORIGIN OF STOVE-PIPE HATS AND TROUSERS.

Somewhere about 1753 a hatter, named John Hetherington, of London, made and wore the first tall hat, now known as the silk, full dress, plug, or stove-pipe hat. A horse saw him and ran away. The owner of the horse sued Hetherington, but lost his case, the judge doubtless holding that an Englishman has an inalienable right to dress as ugly as he can. One time there was a king who had a deformed knee; he abandoned the knickerbockers which revealed the weakness of the royal leg, and took to long trousers. Hetherington and the king have long since gone to their reward, but their ghosts still ride civilized man, one at one end, and one at the other, from Paris to Tokio; and Lord-a-mercy! we daren't even laugh at the spectacle!—*Frank Crane, The Atlantic.*

Section on Historical Pharmacy

Papers Presented at the Sixty-First Annual Convention

HISTORY OF THE ORGANIZATION OF THE MASSACHUSETTS STATE PHARMACEUTICAL ASSOCIATION.

E. C. MARSHALL, BOSTON.

The first steps looking to a state-wide organization of Massachusetts pharmacists were taken at a meeting of the Essex County Druggists' Association at a meeting held by that association on Eagle Island, in the Merrimac river, in July, 1881.

This action was the direct result of the failure of the Essex County Association to secure favorable action by the legislature of that year upon its petition for the enactment of a pharmacy law for the state. On motion of Mr. Joseph W. Colcord, a pharmacist then in business in Lynn, the association voted to appoint a committee to consider the question of the formation of a state pharmaceutical association and as to the advisability of the enactment of a pharmacy law, the two questions being thus connected because it was believed that should it be deemed advisable to petition for a pharmacy law, there would be much greater probability of such a law being approved by the legislature, if petitioned for by an association embracing representation from all parts of the state, than if it were to be asked for by the druggists of a single county. The motion of Mr. Colcord was adopted, with the substitution of the standing committee of the Essex county association for a special committee, which the motion contemplated, and after several conferences of that committee it was decided by them to take the consensus of opinion of the druggists of the state as to the formation of an association, and a circular was issued to all the members of the profession in January, 1882, asking for their opinion upon that question.

This circular met with a favorable response from about two hundred and fifty of the druggists, and in consequence of their approval, the committee of the Essex county association called a meeting of those druggists who had responded favorably to their suggestion. This meeting was held at the Revere house on March 8, 1882, with the following persons in attendance:

C. B. Emerson, Haverhill.
H. M. Whitney, Lawrence.
H. A. Estabrook, Fitchburg.
W. W. Hill, Woburn.
A. F. Thompson, Boston.
A. M. Cutler, Holliston.
F. T. Whiting, Great Barrington.

W. H. Flynn, Boston.
J. J. Whipple, Brockton.
Archie Dakin, Wareham.
F. M. Pease, Lee.
W. S. West, Hudson.
E. S. Stebbins, Boston.
E. G. Frothingham, Haverhill.

N. D. Toppan, Brockton.
S. O. Daniels, Natick.
Thos. B. Nichols, Salem.
W. B. Morse, Ind. Orchard.
J. W. Colcord, Lynn.
J. N. Ames, Chelsea.
W. E. Luscomb, Salem.
C. F. Hanson, Taunton.
C. A. Southworth, Hingham.

W. A. Macurda, Fitchburg.
A. K. Tilden, Boston.
C. F. Thayer, Holliston.
W. W. Bartlett, Boston.
G. F. Densmore, Worcester.
A. L. Kimball, Charleston.
E. B. Gordon, Lynn.
G. F. Wheeler, Randolph.
J. H. Lawrence, Boston.

The meeting was called to order by Mr. C. B. Emerson, of Haverhill, who read the call for the meeting and called for nominations of officers for the organization of the meeting. Mr. C. F. Dinsmore was elected as Chairman of the meeting, and Joseph W. Colcord was chosen Secretary. A committee was appointed to draft a constitution and by-laws for the government of the association and also one to nominate officers. After a discussion of the objects and advantages of the proposed organization the gathering adjourned to be called together at a later date.

The next meeting of the organizers was held at Horticultural Hall, Worcester. About one thousand notices were sent out to the druggists of the state, said notices reading as follows:

"IN UNITATE POTENTIA EST."

In response to a circular issued by the Standing Committee of the Essex County Druggists' Association, thirty or more druggists met at the Revere House in Boston, on the eighth of March last to consider the practicability of forming a State Pharmaceutical Association similar to those in existence in many other states. The object and aim of the proposed association having been presented by several gentlemen interested in the subject, it was voted unanimously that such an association be formed in deference to the expressed desire of druggists from every city and important town of the Commonwealth.

The committee to whom was referred the selection of time and place of holding the first annual meeting have decided to accept the generous invitation of the Worcester Pharmaceutical Association, to meet in their city, Wednesday, May 17, in Horticultural Hall. The meeting will be called to order promptly at 10 a. m. It is desired that every pharmacist in accord with the subject of the proposed association shall be present, as prominent members of our profession will address the convention upon topics of great interest to all of us at the present time.

The annual assessment will be made very small so that no one be debarred from becoming a member. It is unnecessary to call attention to the value of concerted action in all professions, more particularly in one like our own. We all know that where the one singly may fail, the many united, achieve success. Exhibits of special value to pharmacists will be welcomed, suitable rooms being assigned for this purpose. Let each one of us so interest himself that our Association shall be second to none in efficiency or membership.

Art. IX of proposed Constitution: The aim of this association shall be to unite all reputable druggists and apothecaries of this state for mutual encouragement and assistance; in improving the existing methods of pharmacy by disseminating the latest discoveries in our art, thereby stimulating to farther discoveries and inventions; to establish closer and more cordial relations between pharmacists, physicians and the public at large; whereby we may promote the general welfare and tend to the mutual advantage of all; to discourage within due limits unwise competition in our own ranks, and to devise means to

prevent our lawful profits being taken by those, outside our profession, engaged simply in commercial pursuits; to elevate the standard of our profession and ultimately to restrain the practice of pharmacy to properly qualified druggists and apothecaries.

If you intend being present please notify previous to May 5, so that the Worcester Association may have ample time to make necessary arrangements for our accommodation.

J. W. COLCORD, Secy. Pro. Tem.

April 15, 1882.

This meeting was called to order by Mr. William Bush, the President of the Worcester Druggists' Association, who delivered an address of welcome and congratulation to those present, after which the convention selected Mr. C. B. Price, of Salem, as President pro tem and J. W. Colcord as Secretary pro tem. A constitution and by-laws were adopted, under the provisions of which the convention proceeded to an election of officers. Mr. S. A. D. Shepherd was elected the first President of the association, and Wm. Bush, H. A. Estabrook and F. T. Whiting, Vice-Presidents; Joseph W. Colcord, Permanent Secretary, and F. B. Butler, Treasurer.

Prof. P. W. Bedford, of New York, was present and read a paper on Alkaloids. The other papers read were "The Pharmacopoeia," by S. A. D. Shepherd; "Hydrostatic Pressure as Applied to Pharmaceutical Purposes," by Henry A. Estabrook; "Pepsin, its Mode of Manufacture and Assay," by W. W. Bartlet, and the "Metric System," by Prof. G. F. H. Markoe.

Thus was the Massachusetts State Pharmaceutical Association born, and thus it entered upon its career of usefulness—not only to the pharmacists of Massachusetts, but to those of the nation, for many of the papers read at its several sessions, during the thirty-one years of its existence have been of positive service to the pharmaceutical profession of the whole country, and its proceedings are a mine of information embracing all subjects, some of most engrossing interest to all the members of the profession. Particularly has its labors been crowned with success in the legislative field, where its work has been of inestimable service to the pharmacists of our state.

Its legislative committee soon secured the passage of the law establishing a pharmacy board and regulating the practice of pharmacy in the state, and the continuous and unwearying work of that committee has been demonstrated, not only in securing the passage of many bills of advantage to the Pharmacists, but also in obstructing and preventing the approval by the legislature of many proposed measures, whose operations would have been trying, vexations and burdensome to the members of the profession.

To show the important work achieved and the influence upon legislation exercised by its legislative committee, I have only to say that of the more than two hundred bills considered by the general court of Massachusetts at its last session which affected directly and indirectly our profession, not one bill was enacted into law which was opposed by the legislative committee of the association, and that every bill which that committee approved was passed and put upon our statute books.

A history of the Massachusetts Pharmaceutical Association which would present an adequate and complete idea of its activities and usefulness would be

manifestly impossible within the limits of such a paper as this. A proper presentation with its elaborate detail of facts, however interesting, would become wearisome to the listener before a tithe of the pages such a history would fill could be read. It is, therefore, with much regret that leaving unwritten a complete history of the thirty-one years of its career of usefulness, embracing the names of many of those eminent and loved in our profession, I submit this fragment of its history to your honorable body, which paper only describes the preliminary steps leading to the foundation of the Massachusetts State Pharmaceutical Association, and to the ultimate success of that work, and leave to time and some abler pen the writing of its fuller history.

SOME IMPORTANT DATES IN PHARMACAL CHRONOLOGY SINCE 1700.

J. F. LLEWELLYN, MEXICO, MO.

- 1700. Franklin sold drugs for ten years.
- 1700. Kew Garden began on 11 acres, now 270 acres.
- 1702. Amonton calculated absolute zero —240, and expressed the opinion that air could be frozen solid.
- 1711. First patent medicine in U. S. "*Tuscora Rice*" to cure consumption.
- 1713. Erection of the first "Anatomical Theater" in Berlin by King Frederick Wilhelm I.
- 1716. Apothecaries of Boston cut price of bleeding to sixpence.
- 1728. John Bartram established near Philadelphia the first botanical garden in U. S.
- 1740. Hellott distilled anilin from indigo.
- 1743. Lavoisier born (1743-1794).
- 1760. Haller injected aqueous extract of putrid matter and found that death resulted (1708-1777).
- 1766. Hydrogen discovered by Cavendish.
- 1747. Marggraf, an apothecary, discovered magnesia and alumina and showed identity of cane and beet sugar. He is the "Father" of Industrial Chemistry.
- 1771. Linneaus knew 8551 species of plants (1707-1778).
- 1750-1790. Period of Black, Cavendish, Watt, Priestly, Davy, Bergman, Scheele, Lavoisier.
- 1759. Braun at Moscow froze mercury.
- 1765. First medical school in U. S. established at Philadelphia.
- 1772-83. Scheele discovered manganese, chlorine, baryta, arsenite of copper, molybdenum, uric, lactic, mucic, gallic, oxalic, hydrocyanic and malic acids, and glycerin.
- 1772. Rutherford isolated nitrogen.
- 1774. Oxygen discovered by Priestly.
- 1776. Apothecary General for revolutionary army created, re-enacted 1789, abolished 1802, revived 1812, abolished 1822.

1777. Oersted born, son of a pharmacist, apprenticed to his father 1789; 1813 published "Researches on the Identity of Chemical and Electric Forces" (1777-1851).
1777. Wenzel of Saxony found first principles of chemical equivalents; 1789 Higgins of Dublin added to this and suggested atomic theory, and claimed priority 1814.
1778. First American pharmacopoeia published.
1772. Richter's first work on combination published.
1785. Schoepf's *Materia Medica Americana* published.
1794. Priestly arrived in America.
1794. First Irish pharmacopoeia published.
1796. Jenner's first vaccination.
1795. Trommersdorf established at Erfurt a chemico-pharmaceutical institute; instructions given in logic, mathematics, physics, botany, zoology, mineralogy, chemistry and pharmacy. This school, together with the influence of its founder, raised the practice of pharmacy to the dignity of a profession in Germany.
1798. Barton's Collection for a Vegetable *Materia Medica*, part first, published.
1799. *Nux vomica* official in *Pharmacopoeia Borussia*.
1800. Dumas born; he was apothecary, chemist, diplomat, and perpetual secretary of the French Academy of Science (1800-1884).
1800. Nitrous oxide studied by Davy.
1800. Volta made electric chemistry possible.
1801. Hare invented the ox-hydrogen blowpipe.
1802. Drug store established at Poughkeepsie, N. Y.; now in existence.
1803. Dalton announced his atomic theory.
1803. Liebig born; was ten months in an apothecary shop (1803-1873).
1804. Seguin found a crystalline substance in opium.
1805. Peter Wolfe, last of the alchemists, died in London.
1805. Morphine found by the German apothecary Sertürner.
- 1807-08. Potassium, sodium, strontium, calcium, boron and magnesium isolated as elements by Davy.
1807. Person recognized 20,000 species of plants.
1808. Gay-Lussac researches on gases.
1808. *Pharmacopoeia* of Massachusetts Medical Society published.
1809. De Candolle recognized 30,000 species of plants.
1809. Charles Darwin born (1809-1882).
1810. Asa Gray born (1810-1888).
- 1811-40. Berzelius perfected atomic theory.
1811. Iodine discovered by Courtois.
1812. Davy published "Elements of Chemical Philosophy."
1813. Elementary nature of iodine discovered by Davy and Gay-Lussac.
1815. Act of parliament requiring examination and license for apothecaries, which first recognized apothecaries as legitimate practitioners. In 1819 first conviction under this act.
1818. Faraday suggested use of ether as an anesthetic.

1818. Ultramarine blue made accidentally. In 1828 it was an article of commerce, price \$2.66 a pound.
1818. Hydrogen peroxide discovered by Thenard.
- 1820-30. Achromatic and aplanatic microscope perfected.
1820. Quinine discovered by Pelletier and Caventon.
1820. First U. S. Pharmacopoeia published in Latin and English.
1820. A pure food stir in London. Alum in bread scare.
1821. First College of Pharmacy in U. S. founded in Philadelphia.
1822. Gauze over windows and sleeping under nets found to lessen attack of malaria.
1823. Faraday liquified chlorine.
1826. Balard, a French pharmacist, discovered bromine.
1826. Wöhler first obtained aluminum.
1828. Wöhler's synthesis of Urea.
1830. Nux vomica official in U. S. P.
1831. John M. Maisch born (1831-1893).
1831. Liebig, Soubeirane and Guthrie discovered chloroform.
1832. First drug store in Chicago.
1832. Runge obtained anilin from coal tar; 1834 phenol; 1837 anilin colors.
1835. Thielen produced liquid carbonic acid.
1837. Bunsen began work on cacodyl compounds; cacodyl cyanide 1845.
1839. Schönbein discovered ozone.
1840. Liebig published "Organic Chemistry as Applied to Agriculture;" 1842 "Animal Chemistry."
1840. London Society of Apothecaries increased studies of candidates, specifying course of lectures and number of lectures; example followed by the College of Surgeons.
1840. Crum Brown first used term valency.
1840. Hoffman and Fritsche prepared anilin.
1841. Pharmaceutical Society of Great Britain founded.
- 1841-2. Charles Jackson showed that ether made surgery painless.
1842. Dr. Long, of Georgia, performed the first surgical operation with ether.
1842. A Roman "patent-medicine die" found in Ireland, probably used 100 B. C.
1844. Ibsen six years an apothecary.
1844. Dr. C. W. Wells used nitrous oxide in extracting teeth.
1848. Danielssen used thermometer in fevers.
1848. Lord Kelvin (then Wm. Thompson) calculated absolute zero —273.
1848. Joule calculated the mechanical equivalent of heat.
1849. Wurtz and Hoffman discovered ethyl, methyl and phenyl compounds, calling them ammonia type compounds.
1851. Corti used stains in microscopic work; Welker and Osborne in 1856; Gundlach in 1858.
1851. Goodyear combined sulphur and india rubber.
1851. American Pharmaceutical Association founded.
- 1853-4. Pichon used electric arc for smelting.
1855. Bunsen burner invented.
1856. Perkins made mauve anilin dye.

1856. Panum isolated putrid poison and found it compared in toxicity with snake venom.
1857. Pasteur shows that lower organism caused putrefaction.
1857. Livingstone just missed discovering relation between mosquitoes and malaria.
1858. Shaws garden established. In 1913 has 700,000 specimens.
1858. Austin Goodyear Day made hard rubber.
1859. Gun Cotton discovered by Seimens and Schonbein.
- 1864-69. Newlands, Meyer and Mendeleef discovered periodicity of elements.
1865. Pasteur began his work in Bacteriology.
1865. Kekulé's "Benzol Ring" theory announced.
1866. Jones and Dupre obtained from liver animal chinoidine.
1867. Lister used phenol as an antiseptic.
1868. Bergam and Schmeidaberg obtained from putrid yeast and blood "Sulphate Sepsin," 0.01 gramme injected killed a dog.
1869. Hyatt made celluloid.
1870. Selmi suggested name Ptomaine and did work of great value in study of Ptomaines.
1870. Cheseborough made vaseline.
1872. Scheffer improved process for making pepsin (1821-1874).
1874. Wm. Procter, Jr., died (1817-1874).
1876. Nenki made the first ultimate analysis and determined the formula of a ptomaine.
1879. Saccharin made by Fahlberg at Johns Hopkins University.
1879. Castner process for Aluminum.
1880. Lavernon found malarial parasites in blood of patients; confirmed by Sternberg 1886.
1881. Dr. Carlos Finlay suggested transmission of yellow fever by mosquitoes. Cingalese writers, sixth century, mentioned 67 varieties of mosquitoes; and that four varieties of fever were caused by the bite of mosquitoes.
1883. Wroblowski liquified oxygen.
1883. Eighty-three pounds of Aluminum produced.
1884. 281,000 pounds of Bromine made in U. S.
- 1884-5. New York and Brooklyn Formulary published.
1885. Wroblowski and Olzewski liquified aid and hydrogen.
1886. Fluorine isolated by Moisson.
1888. National Formulary published by the A. Ph. A.
1893. Cryoscopy used to study Benzene series.
1894. Manson suggested that mosquitoes served as intermediate host for malarial parasite, confirmed by Manson and Ross, 1900.
1895. Roentgen Rays discovered.
1895. Linde invented Liquid Air apparatus.
1896. Phila College of Pharmacy celebrated 75th anniversary; one member of the first class then still living.
1898. Dewar liquified hydrogen; claim of 1885 thought to be an error
1898. Tripler made commercial liquid air.
1898. Radium discovered by M. and Madame Curie.
1898. Demonstrated that mosquitoes cause malarial fever.

1900. Brassuer and Sampole produced color photographs.
1900-01. Dr. Reed demonstrated that yellow fever is conveyed by mosquitoes.
Mary Kingsley medal awarded to Dr. Carlos Finlay, 1907.
1900. Defaur made pyrometer with quartz bulb and tin as the liquid, Muschenbrock, 1730, used a metal bar; Wedgwood used clay 1788; Siemens electricity, 1871.
1906. Pure Food and Drugs' Act in United States, June 30.
1907. Beltwood's theory that lead is the final decay in the Uranium series, twenty-six elements from Uranium to lead.
1909. Willstaetter obtained crystallized chlorophyll.
1910. Tenth International Congress of Pharmacy at Brussels.
1912. Journal A. Ph. A. first published.
1912. Eighth International Congress of Applied Chemistry, Washington, D. C., and New York City, with a Section on Pharmaceutical Chemistry, well attended by pharmacists and chemists of all nations.
1913. Sixty-first Annual Convention A. Ph. A. at Nashville, Tenn.

JOHN KING, M. D.*

JOHN URI LLOYD, CINCINNATI.

Born in New York City, January 1, 1813; died in North Bend (a suburb of Cincinnati), Ohio, June 19, 1893.

Early Life. The father of Dr. John King was an officer in the New York Customs House. His mother was a daughter of the Marquis La Porte, who came from France with the Marquis de Lafayette, to aid the colonists in their struggle for independence. His parents were in comfortable circumstances, and gave their son a liberal education, intending that he should enter mercantile life.

The trend of his disposition, however, was towards the professions and sciences, he being apt in mathematics and proficient in languages. At the age of nineteen, five languages were at his command, and until near the date of his death, he delighted in German and French literature, the latter being with him a special favorite. At that date French was preeminently the language of science, and to King it was a pleasure to read the current scientific literature, translating therefrom for the medical press of this country, a habit he retained with the methodical habits of his early life, even to a ripe old age.

Immediately after leaving college, he learned the art of engraving bank notes, and ever afterward his hand writing was as smooth and uniform as a page of copper plate. Every page of his numerous publications, including his great American Dispensatory, was written in his own hand, and every word was faultless, every letter distinct, every punctuation mark carefully selected, every sen-

*This brief biography is compiled, largely, from an article by this writer, published in the *Western Druggist*, December, 1893, and reprinted in the *Eclectic Medical Journal*, Cincinnati, January and February, 1894. The writer regrets that space does not now permit of a more extended paper on the life of this remarkable man, a subject of absorbing interest. But those desiring greater details will find them in the admirable work of Professor Harvey Wickes Felter, M. D., in *Bulletin No. 10 (Pharmacy Series No. 5)*, of the Lloyd Library of Botany, Pharmacy and Materia Medica. In this is also presented an admirable frontispiece engraving of the man whose work is herein described.

tence polished and perfect. He was one of the closest of proof readers, and to this writer he more than once expressed his humiliation that through an oversight, one of the pages of his American Dispensatory (numbering 1500 pages), carried, uncorrected, the words "white lard," where he had written "*white lead*."

In early life, Dr. John King exhibited a love for humanity that became intensified as he approached old age. He was continually helping forlorn children, dividing with them his own possessions, and caring for those less favored, as best he could.

His brilliance of intellect, from an early age, is shown by the fact that at the age of twenty-two years, he delivered a course of lectures in the Mechanics' Institute, New York, on "Magnetism and Its Relations to the Earth, to Geology, to Astronomy, and to Physiology," which were enthusiastically received, and repeated before the New Bedford (Mass.), Lyceum. He was also fond of music and the legitimate in drama, and wrote several plays that had a run on the stage. He gave occasional lectures on temperance, but was not a fanatic, using wine temperately himself, though decrying its abuse, even as he did that of medicine.

Dr. King was twice married, his first wife being Charlotte D. Armington, who died in 1847, leaving six children, several of whom are now living, including a son, Dr. John A. King, of St. Louis, Mo. His second wife, widow of Stephen Henderson Platt, New York City, was the daughter of John and Mary Rudman, of Penn Yan, N. Y.

Entrance Into Professional Life. Determining, finally, to become a physician, John King affiliated, as was to be expected from his ideals and family record, with the reformers, or liberal section of American physicians. In this he made a great mistake, as the majority of people look at life, but not as John King viewed the problem. To him, the great work to be accomplished was in the line of reforming the evils that he believed afflicted mankind as a result of the medical methods of those days. He well realized that reformers must ever be in the minority, and that the humanitarian must make great personal sacrifices. Before the inflexible code that then dominated physicians, the outsider in medicine could have no professional existence, and was even ostracised socially, regardless of scholarly attainments or scientific qualifications. When, therefore, at the age of twenty-five, John King, already recognized as student, scientist and scholar, graduated from the Reform Medical School of New York, he became, in the minds of most followers of the medical profession of that day, "John King, charlatan and quack." It has been said of him that "he began his civilizing career in those dark days when medical heresy was dangerous; when depletion unto death was unquestionably 'science'; when the mildest penalty for independent manhood in medicine was personal traduction, and social, no less than professional ostracism."

Professional Experiences. Dr. John King, the now enthusiastic medical reformer, united his efforts with those of Wooster Beach and other reformers of the early day, sacrificing the opportunities he undoubtedly had, to become conspicuous and popular in the dominant school. He traveled extensively over the country, studying the remedies employed in domestic medication, and search-

ing the fields and forests for untried drugs, it being an ideal with both himself and his collaborators, that America was destined to contribute largely to the medicinal agents of the world. He abhorred heroic medication, and insisted that charity began with kindness to the sick. He loved Nature, had faith in vegetable remedies, and in contradistinction to the often cruel methods of that day, he favored pleasant medication, a course that finally led him to become one of the founders of the Eclectic school of medicine, in which he well earned the title, "*Father of Eclecticism*."

In 1846 Mr. King moved to Sharpsburg, Kentucky, where he studied the products of the fields and forests, experimenting in his office laboratory and corresponding with other reformers, "Liberals" and "Eclectics," as they were then beginning to be called, contributing continually to such publications as the *Western Medical Reformer*, and the *College Journal*, Cincinnati. At that time, he being then in the prime of life, the following pen picture was given of him by Dr. A. J. Howe, a description that well applied to the very ending of his life:

"In a general resumé of Prof. King's characteristics, his personnel should not pass unnoticed. He was large in head and trunk, but small in hand and foot. His average weight was 225 pounds. His eyes were blue, and his skin soft and white. There was a peculiar sweetness of expression in his face that few men possess. His manners were those of a well-bred gentleman, and never could he be coarse or morose. He walked with a stately tread, yet with graceful elasticity. His smile, which was easy to elicit, was winning and mirth provoking. It has been said that he never had an enemy, and never was in a quarrel of his own provoking. In a thirty-five years' acquaintance, I never saw him in an angry mood. An expression of his was, that if you would be happy, your conscience must be clear. Dr. King was naturally or instinctively religious, though not bigoted nor intolerant. He would not wrench a shingle from any church edifice, yet contributed to the support of the Gospel in general. He occasionally conducted religious services in the church of his village when the clergyman was absent. His annual sermon to the class of medical students was calculated to do much good to the set of young men who do not properly estimate the influence they are to exert in the world."

In 1849 Dr. King moved to Memphis, Tennessee, where he occupied the chair of Materia Medica in the Memphis Institute. This position he resigned in 1851, to become Professor of Obstetrics in the Eclectic Medical Institute, of Cincinnati, Ohio, a position he filled until removed by a stroke of paralysis, shortly before his death in 1893. During this long period of forty years, Dr. King taught his classes, with scarcely a lecture missed. Of those who received his instruction, all loved him dearly, those who are yet living revering his memory second only to that of Washington, and considering the name of Dr. John King on their diplomas as the highest honor to be desired by an Eclectic.

Professional Work. The scientific writings of Dr. King are too numerous to mention in the space herein at command. They were scattered over fifty years of active life, and among them we find: *The American Dispensatory*, which passed through eight editions; *American Obstetrics*, 1855, of which three editions were issued; *Women, Their Diseases and Their Treatment*, 1858; *The*

Microscopist's Companion, 1859; *The American Family Physician*, 1860; and *Chronic Diseases*, 1866.

During his career, Dr. King discovered* and introduced to his professional friends Podophyllin (resin of podophyllum), Macrotin (resin of cimicifuga), and Irisin (oleo-resin of iris versicolor), the first supplies for commerce being made by William S. Merrell, of Cincinnati. These, and other substances of similar or of alkaloidal nature (first introduced as Eclectic "resinoids"), such as the salts of Berberine (introduced as "Hydrastine"), and Sanguinarine, became regular remedies, and made Professor King conspicuous. The value of these substances led to flagrant abuses on the part of medicine makers, until at last the few worthy members of the the group were overshadowed by others of no credit to any one, a heterogenous collection, entitled to no legitimate home anywhere, being finally included in the commercial lists of "resins, resinoids, alkaloids and concentrations." Then it was that Dr. John King, who had discovered the first of the resins (Resin of Podophyllum), and who had been so enthusiastically hopeful in their behalf, roused by the frauds in that direction that were being perpetrated in the name of Eclecticism, found it necessary to deal the death blow to these products, which, so far as Eclecticism was concerned, was accomplished by his crushing letter to the *Worcester Journal of Medicine* (Eclectic), June, 1855, discrediting the "resinoids" as a class. Several worthy members of the list, however, still live to honor the name of their discoverer. In this connection it may be added that many vegetable remedies that grace the pages of the Pharmacopœia of the United States, trace their origin to Dr. John King.

In closing this phase of Dr. King's life, we must not neglect to state that from 1837 to 1855 he labored in connection with others, including Dr. Forbes, editor of the *British and Foreign Medical Review*, to correlate the discordant schools of medicine, but in this they failed.

Dr. King as a Philanthropist. From the beginning of his career, as already stated, Dr. King was a philanthropist. In politics he aimed to be on the side of the oppressed. He was thus, from his earliest manhood, an Abolitionist, remaining a Republican until the issues that created that party had been consummated, but afterward only occasionally affiliating with that organization. He espoused the cause of labor, and in 1886 he wrote "The Coming Freeman," in behalf of the laboring classes. On the title page of this work we find, "I never could believe that Providence had sent a few men into the world ready booted and spurred to ride, and millions ready saddled and bridled, to be ridden!"

The pen of Dr. King was ever ready to support what he considered the cause of the people, his greatest ambition being to give to others, both of the profession of medicine, and the laity. He always opposed medical laws or class legislation, contending that as then projected and enforced, such laws were designed to

*See Bulletin No. 12 (*Pharmacy Series No. 2*), of the Lloyd Library of Botany, Pharmacy and Materia Medica, entitled "The Eclectic Alkaloids, Resins, Resinoids, Oleo-Resins and Concentrated Principles," and including portraits and brief biographies of John King, William Stanley Merrell, Alexander Wilder, William Tully, Grover Coe, Robert Stafford Newton, Edward S. Wayne, Calvin Newton, and John Coakley Lettsom. 1910.

serve certain medical colleges, to suppress others, and to create favored classes, not to protect the people. Arguments designed to convince him that by law his own beloved college could be strengthened, served but the more to determine his opposition to such laws. He plainly stated that he did not desire to profit by such methods, and to the day of his death he refused to acquiesce in any move to legislate, as he expressed it, "against the people," protesting that the ultimate result of all medical laws, would be a medical hierarchy, in which a favored few, having reached a high political position, would subjugate the rank and file of the profession, to their own elevation and aggrandizement. Very interesting, indeed, was his address on this subject, delivered at the meeting in Cincinnati of the Eclectic Medical Association of America. As the years pass, this address will surely be read, with increasing interest, by professional men, not Eclectics.

To the end of his life Dr. King retained his intellect. During the last two years he often spoke cheerfully to this biographer of the approaching change, which he viewed as serenely as though it were merely a passing into sleep. "My work is done," he would say, "Now it is time for me to go."

Comments by the Biographer.—Professor John King was one of the first to take an interest in the life of this writer, encouraging him, when an apprentice, in 1863, to persevere in his studies, and by his advice in later years, leading him to make a specialty of American drugs, at a time when such work was odious, and when few pharmacists would affiliate with Eclectics. Dr. King insisted that no other field offered such advantages for research, but that a man who entered it, must bear the odium of heterodoxy. From that time until the day of his death, Dr. King took a fatherly interest in the work that followed. One of his maxims was, "It matters little to you what others say about you, but it matters much what you do and say in return," and he ever counseled work and perseverance, not controversy and vituperation. By this rule, right or wrong, he lived, as history will record, and under this rule he died. As the years pass, it becomes increasingly apparent that it was better for all the world, that his life should have been spent on the side of the minority, amid the bitterness of professional exclusion, rather than in the ease that comes to a conspicuous scholar, who casts his lot with the majority.

In every sense of the word, Dr. King was a gentleman. It was once my pleasure to introduce to him my friend, Dr. Charles Mohr. After an hour had passed and we had departed, Dr. Mohr repeated, over and over again, "What a delightful gentleman! And this is Prof. King, the author of the *American Dispensatory*! What a cultured man!" The opponents of Dr. King did not know him, else they could not have retained their personal antagonism, and would have left unsaid many unkind words. The sweetest reflection that comes to me as I think of his kind self is that, whatever others may have done, no vicious sentences stand in his name; he bore no animosity against those whose views were different from his own. That a man so conspicuous as a reformer should have made antagonists, was necessary; but his opponents had never reason to complain of discourtesy on his part. It is surprising that in the face of thoughtless indignities heaped upon him, that would be considered unpardonable if expressed by gentlemen outside the medical profession, he should have maintained

his sweetness of disposition, and his charity for those who differed with him. Yet he did so, and never, to my knowledge, said an abusive word in return. He firmly maintained his stand in favor of American medicine, the American materia medica, and medical liberty for Americans.

RECOGNIZING CUSTOMERS.

A successful cigar dealer, writing recently of his own methods in the Chicago Tribune, ascribed the remarkable growth of his business in great measure to one little detail of business policy.

"At thirty-eight," he said, "I am the owner of a string of fifteen cigar stores, every one of which is making money. I have my good home and a motor car and a mighty nice income—and I owe most of it to one little detail I determined on when I first started business and to which I have adhered ever since.

"Eight years ago I started in the cigar store business. Before that time I had been a clerk, saving a little out of my wages every week against the time when I could start in for myself, and learning everything I possibly could about the business. I had studied the ways of customers, their likes and their dislikes—and I had discovered one great fact; the usual customer, when he enters a cigar store, likes to be known. He likes to be called by his name. Flattery, it is true, but all men are susceptible to it.

"Therefore, when I went into business I made up my mind that no man was going to come into my store the second time without my knowing his name. I tried the rule and I found it aided me. When I saw that some man was coming to my store two or three times in succession I made it a point to find out his name. Sometimes it meant a little expense and a good deal of trouble, but I did it just the same. And the next time he came I called him by his name and greeted him. I could see that the trouble I had taken pleased. It flattered the man to know that I was interested in him enough to want to know his name, and soon, instead of being just a casual customer, he became a real one. More than that, he became a friend of mine and booster for my business. The result was that when he saw a chance to send trade my way he did it. And as soon as that trade came I found out the name of the new man and used it to advantage."

—Western Druggist.

Contributed and Selected

MATERIA MEDICA IN MEDICAL COLLEGES.

L. E. SAYRE, LAWRENCE, KANSAS.

There are at least two causes for the decadence of Prescription Writing by the physician of today. One is the influence of the enterprising manufacturing houses which commercialize prescriptions ready made. The other is the contagion of the drug skepticism of the psychic therapist which tended to force down the rating of the subject of *Materia Medica* and helped to build up various cults of drugless therapy.

One of the students of one of the medical skeptics said to the writer that his medical tutor once said he thought there should be only *two* drugs in the pharmacopœia, Hope and *Nux Vomica*; and really he had his doubts about *Nux Vomica*. He believed in hope even though it be "hope on; hope ever." This author had not much faith in drugs and little charity for those who did.

This underlying spirit of opposition to *Materia Medica*, however, we have interpreted as a righteous protest against the old time method of teaching the subject which consisted partly, in the case of vegetable drugs, of emphasizing as important the botanical origin, the habitat, minute physical descriptions, etc.

Many of the critics have not informed themselves as to the progress in the teaching of *Materia Medica* to medical students and of the progress which the subject itself has made. There are so many other important matters in connection with drugs today that the instructor does not occupy his mind in such details as the above however necessary they be for students in pharmacy.

The educational number of the American Medical Association, issued September 15th, 1909, referring to this subject, uses these words: Provision must be made somewhere in the course for systematic study of the important drugs in order to bring together and focus in the student's mind what is known concerning their action in health and disease; their toxicology; their administration; their origin, the available preparations, dose, etc. It further states that the limit of time at the disposal of the medical student can be much more profitably spent in the thorough study of a relative few important drugs which he will ordinarily use or which are of great scientific interest than if this time were devoted to acquiring a mass of superficial and useless, or worse than useless, information about the numberless drugs described in the books and concerning which very little of definite value is known. In this same bulletin is published two columns of drugs (Column A and B). Column A includes what is understood as the important drugs to be studied thoroughly. Many of the drugs in this column we feel are of little value therapeutically and no instructor would waste much time in considering such drugs as *saccharum*, *syrupus*, *elixir aromaticus* or *acacia*,

which are contained in this list. The committee on education seem to favor the study of the latin name and synonym, the average dose expressed in terms of the metric and the U. S. system, the part used, and the important constituent, physical characteristics, appearance, odor and taste, miscibility or solubility in water or alcohol. The modern teaching of *Materia Medica* does not stop even here but takes up, for example, a study of the relation of physiological action to chemical constitution, the relative toxicity of alkaloids and glucosides in their different stages of purity, drug standardization (chemical and pharmaceutical).

It has been the writer's good fortune, and he has considered it a great honor, to be asked to take charge of the course in *materia medica* for medical students for over twenty years; he has watched with deep interest the progress of medical education and has studiously pursued the trend of medical thought as expressed in various works by eminent authors in *materia medica* and pharmacology. One thing that has impressed him especially is the rapid multiplication of items which burden the pages of treatises on this subject. When we consider the volume of drug products which organic chemistry, synthetical agents and organic products (brought into existence by the study or glandular secretions), the antitoxins, bacterins, etc., it becomes appalling and no sane man would undertake to cover such a field without very carefully sifting the wheat from the chaff. This process of sifting is happily going on and this should be partly the duty of the instructor who should be competent along this line. The initial steps in this work were taken some years ago by the Council of Pharmacy and Chemistry of the American Medical Association. A recent issue, "A Handbook of Useful Drugs,—containing a selective list of important drugs digested for the use of teachers of *materia medica* and therapeutics and to serve as a basis for the examination in therapeutics by state medical examining and licensing boards," represents this work. In the preface of this little volume, which is an epitome, it is stated: "The council on medical education and licensing boards have been trying to restrict instructors and examining boards in *materia medica* to the more important drugs." In pursuance to this aim, examining boards, teachers of pharmacy and therapeutics, deans of medical schools and those directly interested in medical education contribute. The compilation of the replies and revision of same have led to this little volume of 167 pages including the index. The drugs mentioned in this little volume, if properly treated, will consume all the time which the American Medical Association has recommended to be devoted to the subject which is as follows:

The number of hours to be given to pharmacy, prescription writing and systematic pharmacology should be:

(1) For Pharmacy, Chemical Toxicology and Elemental Prescription Writing, 35 hours.

(2) For Systematic Pharmacology and Prescription Writing, 72 hours.

While the published statements of the A. M. A. are such, we have preferred to obtain recent information and opinion first hand from leading medical men. We are better satisfied to get the personal views of men who are authorities in medicine as to the justification of even that much of a course as that recommended by the A. M. A.

This is of vital importance to us as the curriculum of medical colleges, includ-

ing our own, is constantly in a state of unrest and revision. It is also of vital importance to the cause of medical science itself and to the average medical student who can hope to be, at best, only a general practitioner. Since the tendency to minimize the study of materia medica in these revisions is apparent, and as this tendency has a contagious influence upon the student, we have felt always placed on the defensive as regards this study.

To any who will reflect, it must be apparent at first sight that medicine, as it must be practiced, cannot follow along purely ideal and theoretical lines however important these of themselves may be.

The general practitioner must ameliorate conditions with drug agents at his command. However many or few these may be he should know all that is known of them and be placed in a mental position to add to that information by personal clinical experience.

As a matter of fact there are a very few who do not believe in drugs. The pharmacologist and clinician, working in their respective fields and, to a great extent, in coöperation, have contributed material to medical literature which justifies this faith in drugs. The instructor in materia medica (or systematic pharmacology) must be familiar with the result of these labors of the two branches of science and prepare his student so that when he is handed over for therapeutical and clinical work he shall be fully prepared to appropriate the results of these researches and a thorough knowledge of the tools used in the treatment of disease.

Herein lies the justification for the compulsory teaching of materia medica and the duty of the instructor and the entire medical faculty in seeing to it that its emphasis is not minimized.

As before stated, the opinions of the leading medical men concerning the advisability of giving thorough instruction in pharmacy and materia medica have been sought. The result of the correspondence can best be summarized in their own words,—by quotations from their own letters which we quote below:

1.—“I feel emphatically that materia medica should be taught in the medical curriculum as a regular study and not as an elective.”

2.—“I can do no better than outline the courses we give at the Medico-Chirurgical College. In this course we take up pharmacy the first year; in the second year, materia medica; in the third year, pharmacology, and in the fourth year, clinical therapeutics.”

3.—“I have your inquiry concerning the teaching of pharmacy and materia medica to medical students. To drop either of these branches from the medical curriculum would be dangerous; their minimization has been detrimental.”

4.—“I am far from agreeing with Dixon that a knowledge of materia medica is as useless to a medical student as would be the knowledge of typemaking as a preparation for reading a book.”

5.—“Until we are ready to admit that medicines have no value in modifying symptoms, even if such value depends on psychic influence, we cannot regard a physician as competent to deal with disease without an accurate acquaintance not only with pharmacology but with the various preparations of each valuable drug.”

6.—“It is essential that the physician be familiar with all the details of the art of pharmacy.”

7.—“Very few medical graduates in this day go into practice with the proper training in prescription writing and far less of the articles composing them.”

8.—“It is a burning shame that the prominent older physicians, understanding the efficacy of drugs, have withheld their energies in a crusade against this growing evil.”

9.—“It seems to me equally sensible to discuss the omission of physiology or chemistry from a medical course as to discuss the omission of materia medica.”

10.—“In reply to your question as to whether materia medica should be taught in the medical curriculum as a regular study let me say that my answer is emphatically yes.”

11.—“Replying to your letters of December 2 and 15, I will say first that I think materia medica by all means should be taught in the medical curriculum as a regular study. It should never be an elective one.”

12.—“I feel very strongly that materia medica should be taught in every medical school and should be a required branch of study.”

The above excerpts from correspondence referred to have been made very brief to avoid undue length to this article. One correspondent, however, should be more fully quoted who says:

“A number of years ago, in reorganization of our curriculum, materia medica was dropped from the course. This continued for two or three years but the results were so highly unsatisfactory as shown by records in the State Board of Health and in the faculty that we hastened to restore the subject.”

It has been to the writer somewhat of a surprise that the course in materia medica should need defense, but since he has realized this, he has endeavored to make an investigation in order to put himself in a position where he can discuss the subject with some degree of authority. The result seems to be that as long as the practice of medicine deals with materials of medicine (materia medica) the subject should not be permitted to take a secondary position in the medical curriculum.

TELEPHONE COURTESY.

Patience is required at both ends of the line, and when the customer is inclined to be short tempered and “snappy” it is all the more important that the pharmacist—and his clerk—should use tact and studied courtesy in answering the call. You must have faith that the person at the other end of the line has something to say that is worth saying. Don’t let temper get the better of judgment, however, even if it should prove otherwise. You would not do so if you were talking with a customer face to face over the counter, and you cannot afford to do so when talking over the ‘phone. Not alone what you say, but the tone of voice which you use over the telephone may make or lose friends for your store.

The smile, look and personality, that count for so much in the courteous waiting upon customers in the store are lacking, of necessity, when you talk over the ‘phone. The voice must serve the triple purpose. When you are called to the telephone, however inopportune the call—just try to make your voice convey an expression of welcome and good-will.—*The Western Druggist.*

Papers Presented to Local Branches

SAFEGUARDING THE USE OF POISONS.*

JOSEPH E. LAUBER, ESQ.

I shall have no occasion in the treatment of the subject of my address to, in any way, offend your vastly superior knowledge and scientific training in the compounding of poisons. I have no doubt that were the dispensing of toxic substances confined to the class of gentlemen I now have the honor of addressing, a far lesser fatality list would be on record than that which appears today. That poisons will find their way into the possession of the careless user is but recognizing the existence of fact, and we must treat the subject clearly comprehending and understanding this fact.

We must bear in mind that great human element—carelessness—which when found in your mentalities must needs be at its minimum, but which forever has existed and ever will exist in the lay mind without much, if any, systematic method or attempt at its control. It is of no extraordinary credit to our better trained minds that we recognize this, and at this time I want to cite an incident which came to my attention during the course of the little time which I have been able to devote to this subject. One druggist who was asked what he thought of a movement to require all those who dispense poisons to, in some uniform and thoroughly distinctive way, indicate their poisonous character, said, "Oh, people will be careless, and if they have not sense enough to keep their poisons separate from their non-poisonous matters they ought to suffer the punishment that goes with it." The narrowness of such attitude will, I believe, immediately appeal to you.

I think we ought never to forget that a spirit of carelessness is but one of the elements of the frailty of human nature, and that all of us are provided with an ample share of that element.

It is and ever will be that those who are blessed with superior knowledge, training and self-control will teach and guide their less favored brethren. Therefore, a great and well-defined responsibility rests upon us who are able to read and observe human nature as it really exists and who are intelligent enough not to expect the ideal in man.

I am quite sure that your opinion and mine are practically at one concerning the good that will result to humanity at large by the use of distinctive methods of indicating poisons. To my mind, the uniformity of such distinctive methods is of the greatest importance. Fundamentally, it is the user who is to be protected and safeguarded, and he must be trained to recognize the symbol of poison. The skull and cross-bones seldom, if ever, fail in their mission of denoting a deadly

*Read before the New York Branch, Nov. 10, 1912.

substance. This symbol has become known by all intelligent humanity—yet it appeals to the eye only, and one must naturally see it to receive its warning influence. Effective though it is, the effect of its warning mission usually extends no further than the compounding room of the druggist, and when it reaches the user who, I say again, is the one who really requires protection, it usually comes to him in an ordinary bottle, seldom with the recognized symbol.

What is needed, in my humble opinion, is not only a thoroughly distinctive method of indicating poisons, but a uniformity in that distinctive method, so that within a reasonable time humanity may become educated to the knowledge of these distinctive symbols and will instantly recognize the peril that is there and that death lurks nigh. So I take the liberty of impressing upon you that not only should the toxicants be distinctively indicated, both by shape and color, but that the shape and color should be uniform.

I am in favor of having all poisonous solids of one shape and of dispensing all poisonous liquids in one shaped bottle. I take the liberty of suggesting to your attention and for your consideration as to the solids a shape along the lines of the jackstone, which has a pronounced unevenness on all sides and would be difficult to swallow. There should, of course, be on each package containing poison, a statement giving the antidote, with explanation, in plain language, of the emergency treatment.

Of paramount importance in the constructing and assembling of ideas is the carrying of them into practical operation. I understand that your most creditable association and other associations have, from time to time, adopted resolutions favoring either in whole or in part certain phases of this work. It is of little service to humanity to adopt resolutions unless the advance step is taken, because they reach and therefore influence but a small proportion of those who ought to be interested. Now we must realize that probably the majority of pharmacists, unlike yourselves, who have made this most useful of professions a life study, have as their watchword "Commercialism" and not a scientific development of the profession.

We know that many do not keep abreast of the great developments that are constantly taking place, therefore the work that goes on within the confines of your Association is, as to them, absolutely unavailing. This work must be brought into active play, otherwise the people at large, the users, will remain ignorant of the many precautions that science from time to time provides for their protection.

May I presume upon your indulgence to the extent of suggesting a method which I believe to be the orderly way and the most effective of bringing these ideas into practical operation. It would be well that your worthy body submit the entire question to a committee for its attention and report; that the committee be empowered to draft recommendations for a bill for a proposed law; that when the bill is finally shaped to meet your approval it be sent in for the support of your state body and for such other support as you may command; then it be taken directly to our legislators for their action.

That this great and meritorious object will eventually prevail and be brought into practical operation, there is but little doubt; that some obstacles will be encountered in the path to success is to be expected, nor should we be in the

slightest degree daunted by prior failures. The purpose is worthy; it is good; it is an advance step for the benefit of humanity. It is well for us to meet our responsibilities and to meet them in a way that reflects credit upon us.

I sincerely hope to see the day when your organization, the New York Branch of the American Pharmaceutical Association, will claim the honor that will be the just reward for carrying this progressive movement to the homes and for the benefit of the people.

THE NEED OF AUTHORITY FOR NON-OFFICIAL MEDICAMENTS.*

JOHN ROEMER, WHITE PLAINS, N. Y.

There is no doubt that at times we have all found ourselves on the border line of indecision in relation to what is intended when some medicament for which no official standard is extant was requested, and there are many such which find their way through the channels of pharmacy, for which it is impossible to ascertain the facts necessary to intelligent dispensing.

That no such authority exists is surprising, for the need is apparent, and although information is promiscuously scattered throughout the literature relating to pharmacy, this information is far from specific.

Assuming that we do find an abstract or digest on any given subject, we are often in doubt whether the statements are reliable, or whether they are paid advertisements.

The Pharmacopœia and National Formulary occupy their time-honored place under legal authority for all that happened many years ago, but pharmacy progresses and investigators are constantly thrusting new material upon us, either with a view of finding a convenient outlet for their products or with the idea that they may prove of value, and the pharmacist and physician both are confronted with the necessity of distinguishing that which is good from that which is valueless, and hence there is need for some authorized standard that will supply us with the proper information.

Take, for example, a prescription calling for two grains of digitalin to be divided into fifty capsules.

Shall we dispense Digitalin German, Merck's Pure Digitalin, Merck's Crystallized Digitalin, Boehringer's True Digitalin, Digitalin Abbott, French Digitalin, or any one of several other so-called digitalins, the doses of which are given variously as from one-fourth to one two hundred and fiftieth of a grain?

The American Medical Association in 1905 created the Council of Pharmacy and Chemistry, for the purpose of disseminating information regarding such medicaments, such information being transmitted to the medical profession from time to time in the Journal and annually printed in book form.

This work of the A. M. A. is worthy of the highest commendation, but it is a field of work in which pharmacy should be the pioneer and at all times maintain its position in the vanguard of the procession.

The American Pharmaceutical Association claims this as the right of pharmacy,

*Abstract of a paper read before the New York Branch, Nov. 10, 1913.

and in a measure justifies itself; for in the Reports on Progress of Pharmacy we have an able presentation of the sum total of what is now and of the old that has been renovated, but it is mainly in the form of abstracts or digests without any authority or legal standing.

The Department of Agriculture from time to time determines standards which also under given rules and regulations are accepted as such, yet these in the main apply to food products and have little bearing on drugs, except such as may also be classed as foods.

What is needed for pharmacy is an authorized, legalized bureau, to which all material relating to drugs or medicaments may be submitted for investigation, and which will be recognized as standard.

As a further illustration, take a preparation such as *Syrupus Iodo-Tannicus*. It has been my pleasure through this Branch to sift its possibilities so far as pharmacy applies. Having made numerous experiments which finally resolved themselves into a preparation which to all intents and purposes answered the requirements, it was submitted with the conviction that it answered the question of admissibility. It contained by assay 68 percent of iodine combined with the tannin, the balance of the iodine being determined as hydriodic acid. It was at least definite, but other investigators also were taking a hand in this and Casanova and Careane advanced the conclusion that no iodotannate exists in this preparation, but that it is all hydriodic acid.

Marcel Becquet, of Havre, also made this claim. E. Rochereau neutralized the hydriodic acid, and finds iodotannate. H. Percher takes a different view, and besides supplying us with hydriodic acid and iodotannate, obtains also gallic and elagic acids and some free tannic acid, and concludes that the question is as yet unsettled.

By the time I got through these various digests on this preparation I was not at all certain as to what it was. I am not even certain that it is a syrup, and would not be greatly surprised to see some one making the claim that it is only a tan-iodosaccharate in aqueous solution.

And so we find perplexities increasing. The time has surely arrived when we must provide some means to obtain order, and I ask in all sincerity, will pharmacy ever awaken to the needs of the hour?

Why cannot we as pharmacists show some tangible proof that we are entitled to the right to call our profession scientific? No one who appreciates the conditions will deny the need, and our aim should be directed to supply the need and live up to our claim that we do know something about drugs.

Of General Interest

PROCEEDINGS OF THE NATIONAL DRUG TRADES CONFERENCE,
WASHINGTON, D. C., JANUARY 13th, 1914.

(MORNING SESSION.)

Conference called to order at 10:30 a. m. in the Gridiron room of the New Willard Hotel, Washington, D. C., by President John C. Wallace.

On motion of Prof. James H. Beal the minutes of the last meeting as printed and distributed among the members were approved without reading.

The secretary then read the report of the Executive Committee, acting as a Committee on Credentials, and delegates present responded to their names as follows:

From the American Pharmaceutical Association:

John C. Wallace, President.

Prof. James H. Beal.

Samuel L. Hilton.

From the National Association of Retail Druggists:

James F. Finneran.

Charles F. Nixon.

Frank H. Freericks.

From the National Wholesale Druggists' Association:

Charles A. West.

Albert Plaut (absent, represented by Frank E. Holliday).

C. Mahlon Kline.

From the American Association of Pharmaceutical Chemists:

Willard P. Stearns (absent, represented by Dr. A. S. Burdick).

Dr. W. C. Abbott.

R. C. Stofer.

From the National Association of Manufacturers of Medicinal Products:

Adolph G. Rosengarten.

Dr. A. R. L. Dohme.

Charles M. Woodruff, Secretary.

The secretary then read the report of the Executive Committee which was received and ordered to be embodied in the proceedings of this Conference and the several recommendations to be taken up seriatim later.

The report is as follows:

PROCEEDINGS OF THE EXECUTIVE COMMITTEE OF THE NATIONAL DRUG TRADE CONFERENCE HELD AT THE NEW WILLARD HOTEL, WASHINGTON, D. C., JANUARY 12, 1914.

Committee called to order at 10 o'clock. Present: the full committee. On motion duly seconded and unanimously carried the minutes of the last meeting, having been printed and distributed among the members, were approved without reading, as printed.

The Executive Committee then approved the following credentials: (for list of delegates see above.)

The Secretary-Treasurer then submitted the following report:

NATIONAL DRUG TRADE CONFERENCE.

FINANCIAL STATEMENT—January 9, 1914.

Receipts.

Aug. 12, 1913. Balance on hand.....	\$13 55
Jan. 9, 1914. Received second contribution to date from—	
A. A. Ph. C.....	25 00
N. A. M. M. P.....	25 00
N. W. D. A.....	25 00
N. A. R. D.....	25 00
A. Ph. A.....	25 00
	<hr/>
	\$138 55

Expenditures.

Sept. 10, 1913. Postage, 50 2's.....	\$1 00
Oct. 7, 1913. Postage, 100 2's.....	2 00
	<hr/>
	3 00

Balance on hand January 9, 1914..... \$135 55

CHARLES M. WOODRUFF,
Secretary-Treasurer.

Unanimously approved.

The following communication from the New York Pharmaceutical Conference was then read and unanimously referred to the Conference:

"66 WEST BROADWAY, NEW YORK, November 24, 1913.

"Mr. C. M. Woodruff,

"Secretary, National Drug Trades Conference,

"Detroit, Mich.

"Dear Mr. Woodruff:

"At a meeting of the New York Pharmaceutical Conference, held at the College of Pharmacy on Tuesday evening, November 18, the Secretary was instructed to lay before the Drug Trade Conference the necessity of directing national legislation regarding bichloride tablets in such a way that it would be effective and at the same time would not be unduly restrictive of trade. It was pointed out that several bills had already been introduced into Congress, and it seemed highly probable that some sort of measure would be enacted, and in the opinion of the members of the Conference it was thought to be better that the National Drug Trade Conference should take up the matter rather than let it go by default and have a bill passed which would probably be ill-considered and impose unnecessary hardship on the drug trade without safeguarding the public health. Will you kindly bring this matter before the members of the National Drug Trade Conference.

"Respectfully,

"CASWELL A. MAYO, Secretary."

The following telegram from Charles J. Lynn was read and referred to the Conference:

"C. M. Woodruff, Sec. Drug Trade Conference,

"Hotel Willard, Washington, D. C.

"If Executive Committee propose to recommend any federal bichloride legislation at all hope it follows line of simply prohibiting sale of bichloride in ordinary medicinal tablet form, requiring bottle and tablet both to be of unusual and distinctive design, and leave it then to the ingenuity of the manufacturer. Eli Lilly & Co.'s diamond antiseptics fully protect against accidental poisoning, and as pioneers in this field of seven years' standing, we ought to have some consideration. See you tomorrow.

CHAS. J. LYNN."

Topics were unanimously referred to the consideration of the Conference as follows:

Bichloride Legislation.

Postal Regulation respecting medicinal poisons.

H. R. Bills 78, 279, 1683, 187, 1877, 2125, 2954, 2970, 4653, 5149, 9113, 9418, 9832, 3482, 11024.

A Registered Price Act.

Professor James H. Beal then offered the following resolution:

"WHEREAS, The United States Pharmacopoeia and National Formulary, both standards of Federal and state food and drugs acts, are now in process of revision, and whereas, the Committees of Revision of the said volumes are considering for inclusion therein suitable regulations for forms, shapes, methods of packaging and labeling of tablets of bichloride of mercury and other dangerously toxic substances in order to plainly distinguish them from tablets which do not contain dangerously toxic substances, and

"WHEREAS, It is greatly desirable that all laws regulating the sale of poisonous tablets should be uniform and consistent with each other, therefore, be it

"*Resolved*, That it is the opinion of the National Drug Trade Conference that Federal legislation upon the subject of tablets of mercury bichloride and other poisonous substances should be deferred until after the Revision Committees of the United States Pharmacopoeia and National Formulary shall have made their reports in order to lessen the liability of conflict between Federal legislation and the provisions of the said United States Pharmacopoeia and National Formulary."

Charles M. Woodruff moved that the resolution be referred to the Conference with the recommendation that it be adopted.

James F. Finneran seconded the motion.

Unanimously carried.

Professor James H. Beal then offered the following resolution:

"*Resolved*, That it is the opinion of the National Drug Trade Conference that the adoption of suitable regulations for the shapes, colors, methods of packaging and labeling of tablets of bichloride of mercury for inclusion in the next revision of the United States Pharmacopoeia or National Formulary is a matter of vital importance to the practice of pharmacy, the practice of medicine and the public health, and that we heartily recommend to the Committees of Revision of the United States Pharmacopoeia and National Formulary that they take steps to include such regulations in such next revision of the said volumes; and be it further

"*Resolved*, That this Conference tender to the said Committees of Revision any assistance it may be capable of rendering in the construction of such regulations; and be it further

"*Resolved*, That any Federal legislation regulating the sale of mercury bichloride tablets should be confined to regulations respecting the form and style of package in which such tablets are shipped in interstate commerce, and should not include the shipment of the chemical substance mercury bichloride as such."

Charles M. Woodruff moved that the resolution be referred to the Conference with the recommendation that it be adopted.

James F. Finneran seconded the motion.

Unanimously carried.

Prof. James H. Beal then offered the following proposed regulation for the mailing of poisons:

"Non-toxic medicines and anesthetic agents, and medicinal preparations and anesthetic agents containing toxic agents, may be admitted to the domestic mails for transmission to manufacturing chemists and pharmacists, wholesale and retail druggists, public hospitals,

university and college laboratories, and to physicians, dentists, and veterinary surgeons when they comply with the following requirements:

"(a) When not outwardly or of their own force dangerous or injurious to life, health or property, and when not in themselves unmailable under the provisions of Sections 480 and 497.

"(b) When the inner vessel or container bears a label giving the name of the article, the name and address of the sender, and appropriate words of caution when the article is one which may be dangerous if improperly used.

"(c) When they are enclosed in packages in conformity with the conditions prescribed by Section 406, bearing upon their outer surface the correct name and address of the sender, as well as the correct name and address of the person, partnership, corporation or association to which the package is sent.

"The foregoing medicines, medicinal preparations and anesthetic agents may be admitted to the domestic mails for transmission to persons other than manufacturing chemists and pharmacists, wholesale and retail druggists, public hospitals, university and college laboratories, physicians, dentists, and veterinary surgeons when they comply with all the requirements stated in (a), (b) and (c), and also with the following:

"(d) When they do not contain more than one maximum medicinal dose of a contained toxic agent to the fluidrachm or, if in solid form, nor more than one maximum medicinal dose in each pill, tablet or other unit.

"(e) When offered for transmission by manufacturing pharmacists and chemists, wholesale and retail druggists, or by the physician, dentist or veterinarian whose name and address is placed upon the label of the container and also upon the outer surface of the package."

Charles M. Woodruff moved that the same be referred to the Conference with the recommendation that the Conference petition the Postmaster General to issue this regulation in lieu of the one now in force.

James F. Finneran seconded the motion.

Unanimously carried.

After some discussion the Executive Committee then unanimously resolved to recommend to the Conference that it renew its approval of Harrison Bill No. 6282 as now pending before the Finance Committee of the Senate; but with the following amendments:

Page 4, lines 14 and 15: Strike out the words "registered under this Act."

Page 4, line 12 and also line 18: Make the word "pharmacist" read "dealer."

Page 7, line 3, after the word "to," insert the words "to the shipment or delivery of drugs and medicines compounded or dispensed in pursuance of."

It was then unanimously resolved that the Conference be urged to frame and adopt a suitable resolution requesting the newspapers of the country, through the Associated Press and otherwise, not to publish the instruments, weapons, poisons or other means in reporting the details of suicides and murders.

The Executive Committee then adjourned.

CHARLES M. WOODRUFF, Secretary.

Prof. James H. Beal moved that the President appoint a nominating committee consisting of one member from each constituent organization to report at the afternoon session.

C. Mahlon Kline seconded the motion.

Carried.

The President appointed Prof. James H. Beal, Adolph G. Rosengarten, Dr. A. S. Burdick, C. Mahlon Kline and James F. Finneran.

Mr. Samuel L. Hilton moved that the privileges of the floor be extended to Dr. M. I. Wilbert of the U. S. Department of Public Health, Dr. W. C. Woodward, Health Officer of the District of Columbia, Mr. E. C. Brockmeyer, Mr.

Fred A. Hubbard, of the Massachusetts State Pharmaceutical Association, and Mr. Charles J. Lynn of Eli Lilly & Co.

The motion was duly seconded and carried.

Mr. C. Mahlon Kline moved that speakers be restricted to two speeches upon each motion or topic, the first not to exceed 10 minutes; the second not to exceed 5 minutes; provided that after all who desired to have spoken, any delegate might speak again and at further length with the unanimous consent of the Conference.

The motion was duly seconded and carried.

Mr. Charles M. Woodruff then moved the adoption of the following:

"In recognition of the power of suggestion upon morbid and unbalanced minds, the National Drug Trade Conference does hereby urge upon the newspapers of the country that in reporting suicides and murders, details with respect to the poisons, instruments, weapons, or other methods used, be, so far as possible, entirely omitted."

The motion was duly seconded and carried.

Mr. Charles M. Woodruff then moved the adoption of the following resolution:

"WHEREAS, The United States Pharmacopoeia and National Formulary, both standards of Federal and state food and drugs acts, are now in process of revision, and whereas, the Committees of Revision of the said volumes are considering for inclusion therein suitable regulations for forms, shapes, methods of packaging and labeling of tablets of bichloride of mercury and other dangerously toxic substances in order to plainly distinguish them from tablets which do not contain dangerously toxic substances; and

"WHEREAS, It is greatly desirable that all laws regulating the sale of poisonous tablets should be uniform and consistent with each other; therefore, be it

"Resolved, That it is the opinion of the National Drug Trade Conference that Federal legislation upon the subject of tablets of mercury bichloride and other poisonous substances should be deferred until after the Revision Committees of the United States Pharmacopoeia and National Formulary shall have made their reports in order to lessen the liability of conflict between Federal legislation and the provisions of the said United States Pharmacopoeia and National Formulary."

Mr. C. Mahlon Kline seconded the motion.

After remarks by Prof. James H. Beal, Adolph G. Rosengarten, Charles M. Woodruff and Dr. M. I. Wilbert the motion was put and unanimously carried.

Mr. C. Mahlon Kline moved the adoption of the following resolution:

"Resolved, That it is the opinion of the National Drug Trade Conference that the adoption of suitable regulations for the shapes, colors, methods of packaging and labeling of tablets of bichloride of mercury for inclusion in the next revision of the United States Pharmacopoeia or National Formulary is a matter of vital importance to the practice of pharmacy, the practice of medicine and the public health, and that we heartily recommend to the Committees of Revision of the United States Pharmacopoeia and National Formulary that they take steps to include such regulations in such next revision of the said volumes; and be it further

"Resolved, That this Conference tender to the said Committees of Revision any assistance it may be capable of rendering in the construction of such regulations; and be it further

"Resolved, That any Federal legislation regulating the sale of mercury bichloride tablets should be confined to regulations respecting the form and style of packages in which such tablets are shipped in interstate commerce, and should not include the shipment of the chemical substance mercury bichloride as such."

Mr. James F. Finneran seconded the motion.

Mr. Charles M. Woodruff moved for a division of the resolutions and that the Conference proceed to vote upon the first and second resolutions.

Seconded and carried.

The first and second resolutions were then put to vote and unanimously carried.

The third resolution was, after some debate, upon motion duly seconded, put and carried, laid upon the table.

Mr. C. M. Woodruff then moved that the Conference petition the Postmaster General to issue the regulation respecting the mailing of poisons recommended by the Executive Committee.

Mr. C. Mahlon Kline seconded the motion.

After some debate, on motion duly seconded, put and carried, the matter was referred to a special committee to report at the afternoon or evening session.

The President appointed as such committee Mr. Charles A. West, Dr. A. R. L. Dohme, and Mr. James F. Finneran.

The Conference then took up the amendments to the Committee Print of the Harrison Bill 6282 and

Prof. James H. Beal moved that the recommendation to strike out the words "registered under this Act" where they occur in Section 2, Subsection (b), be adopted.

Mr. C. Mahlon Kline seconded the motion.

Carried.

Mr. C. Mahlon Kline moved that the recommendation to strike out the word "pharmacist" wherever it occurs in said Subsection (b) and insert in lieu thereof the word "dealer" be adopted.

Mr. Charles M. Woodruff seconded the motion.

Carried.

Mr. James F. Finneran moved that the recommendation of the Executive Committee to insert the phrase "the shipment or delivery of drugs or medicines compounded or dispensed in pursuance of" after the word "to" line 8, page 7, of the Senate Finance Committee Print of the bill be adopted.

Mr. C. Mahlon Kline seconded the motion.

Carried.

Mr. Adolph G. Rosengarten called attention to the fact that the word "four" in line 17, page 7, of the Committee Print was an error and moved that it be changed to "three."

Seconded and carried.

Mr. Frank H. Freericks then moved that before the bill be finally approved it be changed so as to require the dispensing physician who as such assumes the functions of a retail dealer or pharmacist to write a prescription and keep the same on file the same as a retail dealer or pharmacist does.

Mr. James F. Finneran seconded the motion.

After some discussion, on motion of Mr. Charles M. Woodruff, a recess was taken until 2:30 p. m.

(AFTERNOON SESSION.)

At 2:30 p. m. the Conference was called to order by President John C. Wallace and

Mr. Adolph G. Rosengarten moved that the word "said" in line 17, page 10, of the Committee Print be changed to "such."

Seconded and carried.

Prof. James H. Beal offered an amendment in writing changing the word "three" in Rule 5 of the Code of Rules and Regulations to the word "five" so as to provide an Executive Committee of seven and insure representation of each constituent association on the Executive Committee.

On motion of Mr. C. Mahlon Kline, seconded by James F. Finneran, the session adjourned to meet in one minute.

(SECOND AFTERNOON SESSION.)

The minute having expired President John C. Wallace called the Conference to order.

Prof. James H. Beal then moved the adoption of his proposed amendment offered at the last session.

Dr. W. C. Abbott seconded the motion.

Carried unanimously, by a full Conference.

The Committee on Nominations then submitted the following nominations:

For President, John C. Wallace, New Castle, Pa.

For First Vice-President, Charles A. West, Boston, Mass.

For Second Vice-President, Wallace C. Abbott, Chicago, Ill.

For Third Vice-President, Charles F. Nixon, Leominster, Mass.

For Secretary, Charles M. Woodruff, Detroit, Mich.

J. H. BEAL,
A. G. ROSENGARTEN,
ALFRED S. BURDICK,
C. MAHLON KLINE,
J. F. FINNERAN,
Committee.

Dr. W. C. Abbott moved that Mr. Francis E. Holliday be instructed to cast the ballot of the Conference for the gentlemen named by the Nominating Committee.

Mr. Charles F. Nixon seconded the motion.

Carried.

Mr. Francis E. Holliday announced that he had cast the ballot as instructed.

President John C. Wallace announced the unanimous election of the officers named by the Nominating Committee for the ensuing year.

The subject of finances and reimbursement of the President and Secretary for their expenses was raised by Dr. W. C. Abbott, discussed and referred to the Executive Committee.

The Conference then took up Mr. Freerick's motion and

Prof. James H. Beal moved that the motion be referred to Mr. Freericks as a committee of one to draft such an amendment to the Harrison Bill as he thought would meet the objection raised by Mr. Freericks.

It was suggested by C. F. Nixon and C. M. Woodruff that the situation would be compromised if subsection (a) were made to read:

(a) To the administration of any of the aforesaid drugs to a patient by or under the supervision of a physician, dentist or veterinary surgeon registered under this act in the course of his professional practice only. Provided, however, that such physician, dentist or veterinary surgeon shall personally attend upon such patient.

Mr. Frank H. Freericks remarked that the substitute seemed to be an improvement but he felt that the matter required thought, whereupon, after considerable discussion and further suggestions the subject was made the special order of the evening session, and copies of the proposed substitute were obtained from the hotel stenographer and distributed among the members.

The election of five members of the Executive Committee was then taken up and the following nominations were made from the floor:

James H. Beal
James F. Finneran,
R. C. Stofer,
C. M. Kline,
Adolph G. Rosengarten,
A. R. L. Dohme,
S. L. Hilton.

Mr. Hilton and Mr. Rosengarten declined to run and stated they could not serve if elected, whereupon the Secretary was instructed to cast the ballot of the Conference for James H. Beal, James F. Finneran, R. C. Stofer, C. Mahlon Kline, and A. R. L. Dohme.

The ballot was so cast and the five members last named declared duly elected to serve with the President and Secretary as the Executive Committee for the ensuing year.

Mr. Adolph G. Rosengarten moved that words "said exception" in the last line of Section 8 of the Harrison Bill be made to read "such exception."

Seconded and carried.

The Conference then took under consideration a number of bills pending before Congress and took formal action indicated as follows:

H. R. 78; disapproved.
H. R. 187; disapproved.
S. 279; referred to Executive Committee without recommendation.
H. R. 1683; referred to Executive Committee without recommendation.
H. R. 1877; disapproved.
H. R. 2125; approved.
H. R. 2954; referred to Executive Committee without recommendation.
H. R. 2970; **disapproved.**
H. R. 4653; disapproved.
H. R. 5149; disapproved.
H. R. 9113; disapproved.
H. R. 9418; disapproved.
H. R. 9832; disapproved.
H. R. 11024; disapproved.
S. 3482; disapproved.
S. 3392; disapproved.
H. R. 9237; disapproved.

The several bills approved and disapproved were referred to the Executive Committee with instructions to frame and file suitable protests, etc.

The following resolutions were then introduced by Mr. C. Mahlon Kline, duly seconded and carried:

"Resolved, That the Conference go on record as in favor of any constitutional and sound legislation that will enable the manufacturer or dealer of any article, or brand of an article in which such manufacturer or dealer has an industrial right by patent, trademark, trade-secret, copyright, design or otherwise, to fix, maintain and protect the selling price thereof to the consumer, and thereby maintain the quality and reputation thereof which is of inherent value to the public as well as the manufacturer or dealer of an article called for and purchased under a trade name, or because of the features protected by any such industrial right; provided, such legislation does not open the way to the monopolization of the sale of any other article of the same kind or class which might otherwise be open to proper competition."

On motion the consideration of Treasury Decision 33456 was referred to the Executive Committee without recommendation.

On motion duly seconded and carried the Conference then adjourned to meet at 8 o'clock p. m.

(EVENING SESSION.)

January 13, 8 o'clock p. m. the meeting was called to order in the gridiron room of the New Willard Hotel by President John C. Wallace. Present: a full Conference.

Mr. Charles A. West on behalf of the Special Committee to whom was referred the postal regulation suggested by the Executive Committee, reported the following substitute therefor.

"Poisonous substances intended for internal or medicinal administration when packed in a metal container bearing the address of the sender, together with a label bearing the word 'poison,' may be admitted to the mails under first-class postage rates."

Prof. James H. Beal moved that the report be received for consideration.

Mr. R. C. Stofer seconded the motion.

Carried.

After considerable discussion the substitute was, on motion duly seconded, put and unanimously carried, approved and Mr. Charles A. West duly appointed to inform the Postmaster General of this action of the Conference.

On behalf of the same Committee Mr. Charles A. West moved the adoption of the following resolution:

"Resolved, That the Committee on Revision of the United States Pharmacopoeia be requested to consider the desirability of inserting in the forthcoming revision of the United States Pharmacopoeia a section defining the word 'poison.'"

Mr. C. Mahlon Kline seconded the motion.

Carried.

The Conference then took up the proposed substitute for subsection (a) of Section 2 and

Mr. James H. Beal moved that the proposed substitute for subsection (a) of Section 2 of the Harrison Bill as typewritten and distributed among the members be adopted.

Mr. C. Mahlon Kline seconded the motion.

Mr. Frank H. Freericks moved, as a substitute to Professor Beal's motion, to amend by inserting the words "and in the presence" after the word "supervision" in the second line, and by striking out the remainder of said subsection and inserting the words "and such administration shall be considered a consumption thereof for the purposes of this act."

Mr. Charles F. Nixon seconded the motion.

After some discussion Mr. Freericks' motion was put to vote and lost by a vote of 12 to 3.

Prof. Beal then asked the Conference to consider the advisability of following out Dr. Wilbert's suggestion and striking out the words "registered under this act"; whereupon by unanimous consent these words were stricken out and the substitute as adopted by the Conference made to read:

(a) To the administration of any of the aforesaid drugs to a patient by or under the supervision of a physician, dentist or veterinary surgeon in the course of his professional practice only. *Provided, however,* that such physician, dentist or veterinary surgeon shall personally attend upon such patient.

Mr. Charles M. Woodruff moved that the Conference reaffirm its approval of the Harrison Bill 6282 as now presented in the Senate Committee Reprint with such changes as the Conference had this day adopted; and urge upon Congress the immediate passage of the same.

Dr. W. C. Abbott seconded the motion.

The motion was then put and carried with three dissenting votes as follows:

Mr. Frank H. Freericks stated that he desired to be recorded as voting against the motion because the bill still discriminated in favor of the dispensing doctor against the pharmacist.

Mr. James F. Finneran stated that he desired to be recorded as voting against the motion because of instructions given him by the Executive Committee of the Association he represented.

Mr. Charles F. Nixon stated that he desired to be recorded as voting against the motion for the same reason Mr. Finneran had given.

Upon inquiry of Dr. A. R. L. Dohme, Prof. James H. Beal, Secretary of the American Pharmaceutical Association notified the Conference that that Association had referred to the Conference the subject matter of some possible amendment to the food and drug laws that would eliminate the evils of the so-called variation clause without removing or prejudicing the protection it afforded to legitimate interests, and against other and greater evils that would follow if the "variation clause" were not a part of the law.

Dr. A. R. L. Dohme moved the adoption of the following resolution:

"Resolved, That it is the sense of this Conference that it is opposed to all legislation tending to eliminate the 'variation clause' from the food and drugs act."

Motion seconded.

Mr. Charles M. Woodruff stated that his association, the National Association of Manufacturers of Medicinal Products were most vitally interested in this question and most earnestly opposed to any elimination of the "variation clause"; but that in all fairness such summary action as Dr. Dohme's resolution, if adopted, would effect, should not be taken. He believed there were many who were honestly in favor of the absolute elimination of the "variation clause" to

remedy some evils that had, perhaps, sprung up under it; but he believed that these advocates could be made to see the greater evils that would follow the elimination of the "variation clause"; and he further believed in constructive work, and that if the Conference could get together with the representative of such advocates some way of meeting the situation might be discovered, and a plan agreed upon that would save much legislative contention, and long and expensive litigation to preserve industrial rights that would follow any law eliminating the "variation clause." He therefore moved the whole matter be referred to the Executive Committee for the purpose of effecting such a conference.

Mr. James F. Finneran supported the argument of Mr. Woodruff in some interesting remarks, and seconded the motion, which was put to vote and unanimously carried.

Dr. M. I. Wilbert suggested that the Executive Committee of the Conference get in touch with the National Association of Food and Drug Commissioners.

Mr. Adolph C. Rosengarten moved that the Secretary of Agriculture be requested to give the Associations connected with this Conference, as well as others interested in the production and sale of insecticides and fungicides a hearing respecting certain interpretations of the Insecticide Law of 1910; and that the Executive Committee arrange for such hearing.

Seconded and adopted.

Dr. W. C. Abbott moved that a stenographer be employed for the Secretary. Seconded and referred to Executive Committee.

There being no further business the Conference adjourned to meet at the call of the President.

C. M. WOODRUFF, Secretary.

THE REAL TEST OF A MAN.

There are plenty of men who, through fortunate circumstances, go pretty high, yet who could not stand an hour's test of real grueling by fate. They would wilt down into whimpering cowards and abject failures. The final test of character is the things one will not do under any circumstances. There are men we instinctively know would be ground into dust and scattered to the four winds before they would yield in a matter of honor. There are men we know who would face all the disasters and pain that might come without losing their vital grip on life. Their personality is indestructible.

It is this bed-rock quality, this power of ultimate resistance, that marks a man as a real man, whether he shovels coal or sails a million-dollar yacht.—*Popular Magazine*.

Editorial Notes and Announcements

JAMES H. BEAL, Editor.....Scio, O.

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished with not to exceed 50 reprints, without cover, of papers accepted for publication in the JOURNAL.

Larger numbers of reprints will be supplied by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.

300 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.

50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.

100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.

300 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.

50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.

100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.

300 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co. Columbus, Ohio.

RETROSPECT OF FIFTY YEARS AGO.

(Reprinted from "The Chemist and Druggist," November 14, 1863.)

American Pharmaceutical Association.

At the annual meeting, reported in the issue, the following preamble and resolution were, on the motion of E. Parrish, of Philadelphia, *unanimously* adopted:

"WHEREAS, The mutual cultivation of science tends to break down sectional and national distinctions, and to unite all of kindred objects and pursuits in a common bond of friendship and good-will; and

"WHEREAS, We have learned of a Conference of the Pharmacutists and Chemists of Great Britain having been summoned, near the same time as our present meeting, at Newcastle-upon-Tyne, as we believe for purposes similar, if not identical with our own;

"Therefore, be it resolved, That we view this movement on the part of our brethren of the mother-country with feelings of satisfaction and encouragement, and invite their friendly co-operation and correspondence in advancing a knowledge of the science and art of pharmacy, and in promoting the elevation of the profession to a position commensurate with the importance and dignity of its objects."

It was further resolved, "That a copy of this resolution, signed by the proper officers of the Association, be transmitted to the President of said Conference of the Pharmacutists and Chemists of Great Britain by our Corresponding Secretary, who is also directed to solicit an exchange of their public proceedings for those issued by our Association."—(*Chemist and Druggist*, Nov. 8, 1913.)

ANTISEPTIC LEAVES.

The frequently reported cases of poisoning by mercury bichloride tablets during the past year has been fruitful in bringing forth suggestions for the distinguishing of poisonous tablets by giving them distinctive and peculiar shapes and colors, enclosing them in characteristically shaped bottles, etc. Federal law makers have also taken a hand by introducing into Congress measures designed to regulate the sale of poisons in tablet form, and when the State Legislatures get into action we may

expect still other regulative measures dealing with the same subject.

A novel method of attaining the same end is seen in the so-called "Antiseptic Leaf" lately brought out by the Wm. S. Merrell Chemical Company.

This Antiseptic Leaf consists of a thick, bibulous paper, in which has been absorbed the same quantity of bichloride mixture as is contained in the ordinary Antiseptic Tablet. One of these leaves added to a pint of water makes a solution 1-1000.

The form of this product is so distinct from any tablet that there should be no danger of its being mistaken for a medicinal preparation and the body being an insoluble, non-edible material, cannot be eaten, even if the attempt were made.

Antiseptic Leaves are put up in packages of twenty-five—wrapped in self-sealing water-proof paper and packed in a carton with complete label and directions for making solutions of various strengths.

THE IDEAL PHARMACY IN 1849.

The difference in the representative pharmacy of the last generation and the popular corner drug store of the present day is well illustrated in the accompanying extract taken from the chapter on Plan and Location of the Pharmacy, in Mohr, Redwood and Procter's treatise, published in 1849.

The three distinguished authors of that volume were perhaps the most eminent pharmacists of their respective countries, Germany, Great Britain and the United States, and no doubt represented the professional ideals of their time. Evidently the pharmacist of that day was a very modest and retiring individual, and his shop a delightful place for quiet meditation on a sultry afternoon. The italics are the Editor's:

"The form that appears to be best suited for the shop of a pharmaceutical chemist is an oblong, one of the short sides of which forms the front, as it is desirable to have long, straight walls, giving depth rather than width to the apartment. It should be dry and well lighted, yet not too much exposed to the direct rays of the sun. *Large windows, therefore, are objectionable; they are not required for the display of pharmaceutical wares, while they occasion a great deal of*

trouble in keeping them clean, and admit more direct sunlight than is beneficial.

"The opinion very generally prevails among pharmacists, that the shop should have a north aspect, or at least that direct sunshine should be entirely excluded; but I have no hesitation in expressing my dissent from this opinion.

"*The entrance to the shop ought not to be directly from the street, but from the passage to the house.* There are several objections to having the entrance directly from the street: it occasions the admission of wind, dust, and wet, when the door is opened, and renders it difficult to regulate the temperature of the room, and insure the comfort and freedom from unnecessary disturbance of those engaged in conducting the business.

"In free-trade England, however, it is generally considered desirable to make the access to the shop as easy and obvious as possible. I have heard calculations made, by some approved economists, to show the loss a tradesman sustains in consequence of his shop-floor being elevated too much above the level of the street, thus rendering it necessary for customers to ascend two or three steps on entering. One step, if it be a low and easy one, is considered beneficial, the advantage resulting from the exclusion of wet and dirt being more than equivalent to the obstruction it imposes on the facility of admission."

Has pharmacy gone forward or backward?

FAREWELL DINNER TO HUGH CRAIG.

Some forty New York pharmacists gave a testimonial dinner to Hugh Craig, at Mouquin's restaurant on the evening of December 26, on the eve of his departure for Chicago to take up the duties of editor of The Journal of the National Association of Retail Druggists. The affair was entirely informal. The guests were seated at a "U" shaped table in a private dining room and were entertained during the dinner with music, through the courtesy of Brune R. Dauscha, F. J. Budelman and J. L. Lascoff, the latter of whom contributed a novelty in the way of entertainment by the loan of a Victrola with a number of very fine records. Mr. Budle-

man led the chorus of a number of popular songs for which parodies had been provided.

During the dinner the chairman of the committee, Caswell A. Mayo, read notes of regret from a number of pharmacists who were unable to be present, each of whom took occasion to pay a tribute to the value of the services which had been rendered by Dr. Craig to the cause of pharmacy both as a journalist and an association worker. Communications were read from George M. Beringer, of Camden, N. J., president of the American Pharmaceutical Association; Thomas E. Potts, of Chicago, secretary of the National Association of Retail Druggists; William Muench, of Syracuse; Dr. A. B. Huested, of Albany; Frank Richardson, of Cambridge; Arthur Wardle, of Hudson; T. S. Armstrong, of Plainfield, N. J.; Edward Sher, E. H. Gane, Dr. H. H. Rusby, Dr. George C. Diekman, Dr. H. C. Lovis, C. H. Tompkins, Dr. William Frankhauser, and Dr. George A. Ferguson.

At the conclusion of the dinner, Mr. Mayo presented the guest with a miniature loving cup and Dr. William C. Anderson presented him with a handsome watch and fob on behalf of the hosts. In acknowledging the compliments conveyed by the dinner and the watch and fob, Mr. Craig took occasion to set forth his views as to the lines along which the Journal of the N. A. R. D. should be conducted and to state his own position on the matter of ethics and the practice of pharmacy.

Below are given excerpts from a few of the communications received:

Harry J. Schnell, manager of The Druggists' Circular: This testimonial dinner given to Mr. Craig by the pharmacists of Greater New York in recognition of his labors in behalf of pharmacy is a well deserved tribute. I feel as though I am perhaps better qualified to speak of Mr. Craig's work in behalf of pharmacy and with a more intimate knowledge of it than anyone in attendance at this dinner, for his work for pharmacy began when he joined the staff of The Druggists' Circular in January, 1906. From that day to this I have been in intimate touch with Mr. Craig's work, discussing it with him on almost every business day from January, 1906, to the present time. Perhaps it will interest you to know something about the way Mr. Craig entered the journalistic field. Along about Christmas of

1905, the Druggists' Circular received a communication from a drug clerk out in the wilds of New Jersey in which he supplied some formulas in response to requests published in the Circular. Incidentally, he said that as he was working twenty hours a day he had little time for writing, but was taking advantage of his "day off" to drop us a line. He explained that his "day off" consisted of the hours from 6 o'clock that evening to 8 the next morning. It occurred to most of us in the office that a clerk who possessed so much information as this one's letter showed that he possessed, and was so fond of laying this information before his fellow workers in written form that he was willing to take time from his "day off" to write it out and mail it, was too good to be grinding out his young life behind the counter for twenty out of the twenty-four hours, so we proposed that he come into the city some day when business was slack and have a talk with us. This he did one Sunday afternoon, with the result that we asked him if he would exchange his twenty hours a day and \$75 a month for eight hours a day and \$16 a week on a three months' trial, adding that if at the end of that time the arrangement did not turn out satisfactorily all around he would not be out anything, as he could return to his \$75 and twenty hours. "I would be out \$6 a month or \$18 in all," replied this lightning calculator, but he said he would think it over and in a few weeks he reported for duty. His employment commenced in the early part of January, 1906, and he has been with The Druggists' Circular ever since—eight years lacking a few days. We were not disappointed in our man. He has proved as diligent and as well informed a worker as his letter and formulas sent on that "day off" of his, back in 1905, presaged, and now he is going away from home to continue his labors in behalf of pharmacy in a new field, and no one wishes him success more heartily than I, and I might include every member of the staff of The Druggists' Circular, of which I feel proud to be the general manager.

George M. Beringer, Camden, N. J., President of the A. Ph. A.: Please convey my personal testimony and appreciation of the services of your guest, Mr. Hugh Craig, in behalf of pharmacy.

Thomas H. Potts, Chicago, Secretary of The National Association of Retail Drug-

gists: I wish to assure you in all sincerity that I appreciate your timely notice and would regard it as one of the most pleasurable events of my life to attend, if opportunity only afforded. Kindly convey to those assembled my very kindest regards and say to them that I will do my very best to keep our friend Craig out of bad company in Chicago and give him all the helpful assistance in my power, and I well know he is going to make a great success.

Many other communications equally complimentary were received from Mr. Craig's friends and admirers.

The menu card bore, besides the menu, a portrait of the guests and a list of the hosts, as follows:

W. O. Allison, W. C. Anderson, H. V. Arny, L. Berger, G. M. Beringer, C. O. Bigelow, F. J. Budelman, William Bessenchutt, L. Cantor, V. C. Daggett, B. R. Dauscha, L. W. DeZeller, J. Diner, S. W. Fairchild, G. A. Ferguson, J. C. Gallagher, A. Gardner, C. Heimerzheim, F. E. Holliday, C. Holzhauser, J. Hostmann, A. B. Husted, C. R. Johnson, H. Kantrowitz, T. Lamb, T. Latham, J. L. Lascoff, C. N. Lehman, H. C. Lovis, W. A. Mansfield, J. L. Mayer, C. A. Mayo, W. Muench, B. L. Murray, F. L. McCartney, H. M. O'Neil, Romaine Pierson, Albert Plaut, T. F. Raymow, Jacob Rehfuß, G. T. Riefflin, J. Roemer, H. H. Rusby, H. J. Schnell, S. Schoenfeld, S. V. B. Swann, J. R. Wall, J. Weinstein.

The Journal of the N. A. R. D. is to be congratulated on securing the services of Mr. Craig, whose long experience in journalistic work and his practical ability as a pharmacist will especially fit him for his new position.—*Midland Druggist*.

EDUCATE THE PUBLIC REGARDING POISONS.

Some months ago a prominent man in a southern city took some medicine in the dark and developed the first of a long line of bichloride poisoning cases. This case was one of purely accidental poisoning. The man did not want to die, and made a brave and pathetic fight for life. He had risen from humble beginnings, it seems; reached a high place in the community, became rich, married a beautiful girl, and had everything to live for. The case teemed with "heart interest,"

and the newspapers took it up and made reams of copy from it. The victim lingered for several weeks, and seemed astonished during his last days, according to the newspapers, at the absence of all pain. The newspapers began to herald this long after the first stages of the case had passed. Possibly without intention on their part, they conveyed the idea to the general public that bichloride of mercury is a painless poison.

The results have been deplorable. Since then more than 100 cases of bichloride poisoning have occurred, and in about 90 percent of these cases the would-be suicides have repented in a few hours and cried for help. In a few cases their lives have been saved, but only in a few. The newspapers, of course, could not foresee this, and are innocent of any intention to encourage a lot of suicides. Conditions have arisen that no man could foresee, but they are serious now, and it will take a lot of work to remedy these conditions. A man who really intends to commit suicide can hardly be restrained. The most careful watching will prove fruitless, as a rule. Eventually, he will find a way. The harm lies in impressing these foolish people who have a family quarrel, get to drinking, get out of work, are despondent from any cause.

Often a wife takes poison to spite her husband, and vice versa. People under the influence of liquor are just as apt to take poison as not. Frequently they do it merely to scare the family and avoid a lecture for drinking. Most of these would-be suicides are quick to yell for help, and some of them do so the moment the poison has been swallowed. Bichloride of mercury is of great value as a germ destroyer and disinfectant, and for years it has been in households without causing any wave of suicide. It is, as all druggists know, a powerful corrosive, and when taken the results are intensely painful. Great agony ensues, and after the poison has been absorbed, recovery is almost impossible. Anyone who takes poison with a view to scaring the family could scarcely select a worse medium.

Druggists may well start a crusade toward educating the public to the fact that bichloride of mercury is not a painless poison, one that may be taken and pumped out a few hours later with no particular harm to anybody. That seems to be the general impression now. It is strange how much harm an

idle report of this kind can do, but the facts confront us. Druggists should let no opportunity go by to impress upon their customers the horribly painful effects of taking bichloride of mercury; and above all, sales of this powerful poison should be watched carefully, especially at this time.—*National Druggist*.

A NATIONAL FORMULARY SUGGESTION.

Thos. D. McElhenie, Brooklyn, N. Y.

One morning my daughter brought down to breakfast an empty vial bearing the N. A. R. D. stock label, "Liq. Antisept. Alk.," etc., and asked me to send over some more, adding, "I can't pronounce all that long name, but if I had a flute I'd play it." I replied, "The long name for that good preparation is the reason why doctors so seldom prescribe it."

A few minutes later, when leaving the house, the word *ALKANTUS* came in my mind as a short name for the preparation. I am sure the word is original. It would be an euphonious title for the preparation and entirely suitable for physicians' use in prescribing.

I therefore propose that it be added as a synonym in the N. F. under the title "Liq. Antisept. Alk.," and that the A. Ph. A. as owners and publishers of the book secure a trade-mark on the name to prevent any one using it commercially, and that the whole matter be set out fully in the journals.

That pharmacists also be asked to refrain from using the name on the preparation exposed for sale, and have it fully understood that a prescription for "*Alkantus*" means "Liq. Antisept. Alk.," official, and made by the pharmacist and not some particular brand.

Further, that the manufacturing pharmacists, who are mostly gentlemen, be asked to refrain from any use of the word in their lists.

I have no desire to exploit the name myself, but as it is my own invention I would like to see it used for the common good in medicine and pharmacy.

Concerning the above Mr. E. A. Sennewald, of St. Louis, says: The suggestion appeals to me as being worthy of consideration. I am very much in favor of "terse terms." I am inclined to believe that such names as are

proposed by Mr. McElhenie would make U. S. P. and N. F. preparations very much more popular with many physicians. It seems to me that many physicians can not or will not write preparations with long names.

It may be unprofitable to be ultra scientific in our nomenclature. At one of our former conventions it was moved and carried that names should be terse. This seems to have been forgotten or overlooked.

'Obituaries and Memorials

Persons having information of the death of members of the A. Ph. A. are requested to send the same promptly to J. W. England, 415 N. 33d St., Philadelphia, Pa. Information as to the age, activities in pharmacy, family, etc., of the deceased should be as complete as possible. When convenient a cabinet photograph should accompany data.

PROF. EDWARD SCHAEER.

It is with great sorrow that we learn of the death of one of the most celebrated pharmacists, chemists and teachers, namely, Professor Edward Schaer, who died at the age of seventy-one years, on October 3, 1913, in Erlengut, Erlenbach, near Zurich, Switzerland.

Professor Schaer, who received many distinctions in pharmacy and chemistry throughout the world, was elected an honorary member of the American Pharmaceutical Association in 1877.

For more than fifty years Professor Schaer has been active, very active in pharmacy, and has been the teacher of a great many pharmacists and chemists all over the world. Many of his pupils in the United States will learn with great regret of the death of their beloved teacher.

On December 7, 1912, Professor Doctor Edward Schaer, director of the Pharmaceutical Institution of the University of Strassburg, Alsace, Germany, celebrated his seventieth birthday, and in memory of this event, Otto Raubenheimer, editor of the *The Practical Druggist*, prepared his biography which was published in the March (1913) number of *The Practical Druggist*. The following is abstracted from the same:

Schaer was born on December 7, 1842, in Berne, and began his pharmaceutical career

in 1861 in Hagenbach's apotheke in Basel and completed his apprenticeship with Pagenstocher in Berne. In Basel, Schaer had an opportunity to hear the lectures of Prof. C. F. Schonbim, the discoverer of ozone and gun cotton, which teachings undoubtedly inspired him with a love for chemistry. During 1866 and 1867 he studied pharmacy under Profesor Fried. Aug. Flückiger at the University of Berne, who at that time wrote his celebrated work "Lehrbuch der Pharmakognosie des Pflanzereiches." (Text-book of Pharmacognosy of the Vegetable Kingdom.) After his state examination, Schaer continued his studies during 1869 and 1870 in Berlin, London and Paris, where he made a special study of pharmacognosy and the many specimens at the museums and universities.

In 1872 he bought the pharmacy of Wilhelm Vogel, one of the founders of the Swiss Apotheker Verein, and married his daughter in 1873. In the same year Schaer also began his academic career by giving lectures on pharmacy at the Polytechnic Institute at Zürich, where he received the title Prof. Hon. in 1876, and became professor of pharmaceutical chemistry, toxicology and pharmacognosy in 1881 and dean of the department of pharmacy in 1891.

One of the greatest honors bestowed upon Schaer was when in 1892 he became a worthy successor to Prof. F. A. Flückiger at the University of Strassburg. Schaer followed the footsteps of his predecessor and former teacher and surrounded himself with a circle of zealous students who in time spread the reputation of the University of Strassburg throughout the entire world.

It was due to the efforts of Prof. Schaer that the well-equipped pharmaceutical institute was built, a pride of the University of Strassburg, as well as the entire pharmaceutical profession.

During the forty years of his academic career Prof. Schaer has published numerous and excellent pharmaceutical, chemical and pharmacognostic papers, including a book by Schaer—Zenetti.: Anleitung zu analytisch-chemischen Übungsarbeiten auf pharmazeutischem und toxikologischem Gebeite. (Laboratory Notes on pharmaceutical and toxicologic subjects.)

Prof. Schaer has also contributed numerous papers to the scientific section of the A. Ph. A. which have been awarded prizes repeatedly.—*Otto Raubenheimer.*

JOSEPH E. MORRISON.

By the death of Joseph Edward Morrison, the pharmacists of Canada have lost one of their leaders, one of their best friends. "As a pharmacist, he was probably the most distinguished figure in Pharmacy in Canada; as a citizen, he was fearless, broadminded and always on the alert for things progressive." He was born in the city of Waterford, Ireland, on January 15, 1862, and died in Montreal, September 2, 1913.

Joseph E. Morrison was President of the American Pharmaceutical Association in 1896, and Dean of the Montreal College of Pharmacy, from which latter institution he was graduated in 1882.

As a youth he took up the study of pharmacy as an apprentice, serving his apprenticeship with Mussen of Quebec; he then clerked for William Laroche, of the same city, and graduated in pharmacy. Later he entered the retail drug business for himself, and after a few years went to Montreal and took charge of the pharmaceutical laboratory of Lymans, Sons & Co., of Montreal, and sometime thereafter became a member of the Faculty of the Montreal College of Pharmacy as a lecturer on materia medica and botany. This work was followed by appointment to the chair of chemistry and pharmacy, his knowledge of both English and French enabling him to impart instruction with equal facility in either language. In 1896, he entered the field of journalism and established the *Pharmaceutical Gazette*.

He joined the American Pharmaceutical Association at the Detroit Meeting in 1888. At the Asheville meeting in 1894 he was elected Third Vice President, and it was largely through his efforts that Montreal was selected as the place of meeting two years later. He was the second Canadian to be honored with the presidency of the Association, and the youngest occupant who ever held that office.

In politics, he was strongly Conservative and an Imperialist. He was intensely in love with his work as a teacher. His whole life seemed to be devoted in an endeavor to impart pharmaceutical knowledge to his students, and as to his ability as a teacher, too much praise cannot be given him.

He leaves a widow and seven children.

Prof. Morrison had a wide acquaintanceship among the pharmacists of Canada and

will be remembered by the older members of the American Pharmaceutical Association as a genial man of quick perception and one whose strong grip upon the details of pharmacy made him many friends. J. W. E.

LOUIS WOLTERSDFORF.

Louis Woltersdorf was born May 6, 1841, in Warnow, Province of Brandenburg, Prussia, Germany. His early education was had in the public school at Lenzen, Germany, and under private tutors.

He came to the United States in 1860. Equipped with three years of commercial experience obtained in Germany, his first position in the drug business in America was with Joseph Dell, who then had a store on Canal Street near Polk Street, Chicago. After two years with Mr. Dell, followed one year with George McPherson on Clark Street. Leaving McPherson, he clerked for W. P. White on West Madison Street. While here, the fires of patriotism for his new and adopted country burned brightly. Through correspondence with his predecessor at White's store, who had enlisted on one of the Mississippi gunboats, he was fired with ambition of joining that branch of the service, and accordingly made application, but owing to his brothers' appeals, who was at the front, and a second brother in military service in the West, not to forget his obligation to his aged parents, he withdrew his application.

Leaving Mr. White in 1864, he opened a store of his own at 114 Blue Island Avenue, corner Ewing Street, his capital consisting of eighty dollars. After eighteen months at this location, two young men, Gerdes and Summerfield, coming from Pittsburgh to buy a drug store, called on him and made what he considered a very liberal offer for his store, an offer of about five thousand dollars, which he accepted.

Again free and untrammelled by business cares, he journeyed west to Kansas, at that time the Western terminal to railway travel. Returning to Chicago, he received from Henry D'Evers, whom he had known for some time, a proposal of partnership. He had two stores, one on West Madison Street near Union Street, and another at the northwest corner of Lake and Halsted Streets. The Madison Street store remained in

D'Evers charge, while Mr. Woltersdorf took charge of the Lake Street store.

After a short partnership, Mr. Woltersdorf bought and became sole owner of the Lake Street store. At this time (winter of 1865 and 1866) the Volunteer Army of the Rebellion was disbanded and a Dr. Woods, late Army Surgeon, made a tempting offer for the store, which was accepted.

Early in the spring of 1866, Mr. Woltersdorf took a trip to Europe, visiting England and the Continent, and while in Germany was married.

Returning to the United States, he opened a store at the corner of Canal and Dekoven Streets, in Chicago. After a few months, he moved this store to the corner of Blue Island Avenue and Morgan Street, where a prosperous business enabled him to buy the property at Blue Island Avenue and Taylor Street. This property he improved with a new building, moving into the new quarters shortly before the great fire of 1871. Here he continued in business until 1894, when he sold the business to the present owner, J. R. Shean.

The Briggs House drug store at one time was jointly owned by Fred Haeger and himself, who sold it to M. L. Waldron, the present owner.

One of the landmarks of the city as a drug store corner, where G. McPherson, Dr. W. Reynolds and Bruno Goll sold drugs, Mr. Woltersdorf owned for a time—i. e., the northwest corner of Canal and Twelfth streets. The store at the northwest corner of Eighteenth street and Blue Island Avenue was opened by him a good many years ago.

In 1865, he was elected a member of the American Pharmaceutical Association, and frequently attended its meetings. He was a member and Ex-President of the Chicago Veteran Druggists' Association.

Mr. Woltersdorf's activity in business really ended with his disposing of all drug store interests in 1894. After this date and extending to about 1898, he was interested in and active as manager for the manufacture of tile.

Up to the last, he took great interest in the men who had worked for him, and followed their careers with pride, and these men were his friends. They respected and loved him.

Since his death, physicians who had known him and had been associated in a way with

him from the early sixties, have told of the confidence medical men had in his accuracy of work and in his honor in filling their prescriptions.

In the sixties and seventies people traveled for miles to get their prescriptions dispensed in his establishment.

He enjoyed traveling and accumulated, through reading and lectures, a large fund of geographical knowledge, and attained local repute as an ornithologist. He enjoyed the company of children, as well as that of matured minds. Men and women in every walk of life learned to know him and to love him. He was a member of Hesperia Lodge of Free and Accepted Masons.

Following a slight indisposition from bronchitis, lasting three days, he died of heart failure on December 12, 1913, at the age of seventy-two years. J. W. E.

Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the editor on the day following the meeting, if possible. Minutes should be *plainly* written, or type-written, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

NEW YORK BRANCH.

(December Meeting.)

A regular meeting of the New York Branch of the American Pharmaceutical Association was held on the evening of December 8th, President C. O. Bigelow presiding.

Chairman Louis Berger, of the membership committee, presented an application from one prospective member for the parent association and reported that he had the assurance of another.

There had been no new developments in national legislative circles, reported Prof. W. C. Anderson for the committee on legislation. He read the new municipal ordinance

regulating the sale of mercuric chloride and referred briefly to the matters discussed at the legislative conference of the New York State Pharmaceutical Association. The matter of safeguarding the sale and use of mercuric chloride was discussed by Messrs. Roemer, Diner, Mayo, Raubenheimer, and Bigelow.

Dr. G. C. Diekman, chairman of the committee on the progress of pharmacy, included in his report a quotation from a German commercial report, about the difficulties of circumventing the adulterators of essential oils; an abstract of an article in the *Chemiker Zeitung* about the drawbacks of porous extraction tubes; an abstract of an article by Koller on the preparation of ampuls (*Pharm. Zentrhl.*); and an abstract of an article on the detection of hexamethylenamine in wine and milk by Von Rosenthal (*Pharm. Zentrhl.*).

George M. Beringer, president of the parent association, who was present as a guest, responded to an introduction by President Bigelow, and asked the members of the Branch to lend individual assistance toward the advancement of the Association.

In some communications read by Secretary Hugh Craig, Prof. J. P. Remington, Dr. H. H. Rusby, and Dr. C. S. Alsberg stated that the synonyms appearing only in the index of the Pharmacopœia had an equal weight with other pharmacopœial names, under the Federal food and drugs act.

The matter of participation in the drug exposition to be held in this city in January was discussed by Messrs. Rehfuß, Craig, and Roemer. A committee, consisting of Jacob Diner, F. L. McCartney, and Louis Berger, was appointed for the purpose of investigating the project.

At the invitation of President Bigelow, W. J. Schieffelin interestingly reviewed the recent meeting of the National Wholesale Druggists' Association.

The speaker of the evening was Prof. Henry Kraemer, botanist and pharmacognosist, of Philadelphia. His subject was "The Growing of Medicinal Plants."

Pharmacognosy as it is applied to the dead plant substance is a "dry" subject, said Professor Kraemer, but it has a larger scope and enlists a new and an absorbing interest when extended in the rational direction of the growing plant. His interest in the study of the growing plant had been first aroused

by a desire to ascertain whether spigelia contained calcium carbonate. The result of his interest in that question was the conclusion that the natural starting place in the study of the constituents of a plant was at the plant as such.

The speaker had a firm faith in the possibility of uniformity in plant constitution through proper cultivation. Although the subject at the present time is in the theoretical stage of consideration, he believed that in this, as in the many seemingly impracticable problems put before the pharmacognosist, the practicable solution was not far off; that the task of standardizing nature was not an impossible one. Despite the existence of well developed distinguishing tests, the matter of the variability of crude drugs was a puzzle to many, a fact which Professor Kraemer attributed to the reluctance of investigators to adopt natural methods of study instead of the teachings of past years. On the whole, he continued, the real knowledge of vegetable drugs is small and their preparation for medicinal purposes is far from scientific. But he foresaw the specialist in preparations who would devote time and energy to the real study of a single drug, or at most a few, and who would arrive at means of assuring uniformity.

There is a growing interest in the cultivation of drug plants, said the speaker, who frequently was asked for information concerning this branch of agriculture. He pointed out the necessity of a knowledge of drug conditions and of the economy of marketing in addition to a knowledge of cultural methods.

Supplementary to his general remarks, Professor Kraemer exhibited and explained some seventy-odd lantern slides depicting limited and extensive experiments in the growing of drug plants. He was, in all, enthusiastic in his belief in the resultfulness of even the least ventures in this field.

The subject introduced by Professor Kraemer was discussed by Messrs. Mansfield, Arny, Mayo, and Raubenheimer. A vote of appreciation was tendered to the speaker.

HUGH CRAIG, Secretary.

<>

CINCINNATI BRANCH.

(December Meeting.)

The monthly meeting of the Cincinnati Branch, A. Ph. A., was held December 16,

1913, at the Lloyd Library. Prof. Lloyd presided.

After disposing of routine business, Prof. Lloyd introduced the subject of the evening, an open discussion of *Erythroxylon Coca* and its Derivatives, he himself taking the initiative, his part being the historical description of the plant and its uses. He mentioned his son's extensive investigations regarding this particular plant, in connection with his duties as Entomologist of Harvard University, having paid special attention to the study of Coca while traveling extensively over the Andes Mountains of South America. The native Indians' use of Coca was unquestionably exhibited, especially by the Indian "Runners," who are subjected to the most exhausting physical efforts in crossing the Andes, carrying with them a modicum of food. A few coca leaves sufficed as a hunger pacifier, and upon this as a basis the runners underwent the most exhausting and exacting journeys. It was accepted by observing travelers of early days that the leaves, being chewed, would yield an abundance of "vital strength." The endurance of people thus employing the drug was noted by the Jesuit Father Blas Valera, under the name *Cuca*. From other explorers it may be gathered how powerful the *Cuca* is in its effect upon the laborer from the fact that the Indians who use it become stronger and much more satisfied, and work all day without eating.

The miner will perform for twelve long hours the heavy work of the mine, and sometimes even double this period without taking any further sustenance than a handful of parched maize, but every three hours he makes a pause for the purpose of chewing a small amount of coca leaves. He would work illy and reluctantly if the proprietor let him want his favorite herb. The same holds good with the Indian porter, messenger, or vendor of his own productions who traverses the Andes Mountains on foot. Merely chewing coca from time to time, he travels with his load of a hundredweight on his back over indescribably rough roads and accomplishes frequently ten leagues in ten hours.

Entering South America from the Pacific Ocean, a very peculiar fact was noticed, namely, that the lowlands, being inhabited by practically all negroes who raise the coca, but do not use the same. On ascending the Andes to a height of 15,000 feet, there is found a gradual diminution of the negro race,

an admixture of the white race, and, finally, the pure Indian race is reached, who are inveterate users of coca leaves, mixing them with a small percentage of lime. They do not chew the leaves, but put the mixture of coca and lime in the cheek and subsist upon small quantities of corn, rice, etc., using no meat; are a happy people, who refuse to sell their coca but will sell anything else.

Professor Lloyd stated many more interesting facts which were greatly appreciated.

The speaker who responded to the scientific features of the subject was Prof. C. T. P. Fennel, who discussed the formation of alkaloids and in particular of cocaine. Professor Fennel was tendered a vote of thanks, and was followed by Mr. Charles G. Merrell, who discussed the commercial side of the subject. Aside from the commercial importance of the crude drug, he paid attention to the possible different action of the crude drug and its alkaloids, maintaining coca to be a very valuable drug, but being much abused by the use of its alkaloids, and called attention to the possibility that the coca leaves may have beneficial effects other than those due to their alkaloids.

Mr. H. W. Jones described the structure of coca leaves, calling attention to the different species. He cited the investigations of Dr. Rusby, showing the various amounts of alkaloids. He mentioned the extensive production of synthetic cocaine, which may possibly be the source of the extreme ill effects of the abuse of cocaine, thus finding a reason for the absence of ill effects in the extensive use of coca leaves by the natives.

Mr. Frank H. Freericks followed with a discussion of the legal aspects of the subject, giving reasons for the legitimate use of cocaine. He mentioned the comparatively recent ill effects due to the abuse of the drug. The first legislation against the sale of that alkaloid took place in the State of New York in 1893, and principally brought about by the misuse of this valuable drug by physicians. Other states soon followed with special restrictive legislation, not alone regarding cocaine, but for other habit-forming drugs; until today the statute books of almost every state show an annual record of laws enacted tending to curb the consumption of habit-forming drugs. However, he maintained that the existing laws are still insufficient and referred to a new New York law as the best yet devised. This law has a special requirement

for the keeping of a record of all sales, requiring a patient's certificate from a pharmacist and obliging the pharmacist to keep a record of the amount of cocaine and similar habit-forming drugs on hand.

Mr. Freericks blames the dispensing physician to a great extent for the misuse of this drug, and claims that the doctor should be placed on the same plane as the dispensing druggist. The failure of spasmodic efforts at the enforcement of these restrictive laws was mainly attributed by the speaker to either the inefficiency of the officials or the insufficient means of enforcing these laws. He pointed out the great need of a Federal law regulating the sale of all habit-forming drugs, by which means the use of such harmful ingredients in patent medicines could be entirely obviated.

Mr. Freericks' legal review of the subject was followed by an open discussion by the members, among whom were Messrs. Edward Voss, Theo. Wetterstroem, C. T. P. Fennel, and others.

It was unanimously agreed that this Branch had had a very interesting discussion of a very important subject, which should be taken up at some future time for further discussion.

Adjournment.

CHARLES A. APMEYER, Secretary.

NASHVILLE BRANCH.

(January Meeting.)

On January 8 the regular meeting of the Nashville Branch of the A. Ph. A. was held at Furman hall, Vanderbilt University, with Vice-President E. A. Ruddiman presiding in the absence of President J. O. Burge.

The committee appointed to make arrangements for the entertainment to be given to the local druggists and their wives made their report through W. R. White, recommending the Y. M. C. A. as the best place to have it. January 22 was selected as the time, and the committeemen instructed to prepare a suitable program for the occasion. Mr. M. E. Hutton then read a splendid article on "Stopping Leaks in Business," which was interestingly discussed by Messrs. J. B. Sand, S. C. Davis, Ira B. Clark, E. C. Finch, A. Nickel, L. J. Pully and C. C. Young, who brought out many points where careful observation and system had saved

them money. A general discussion of provisions of the new state anti-narcotic law followed, in which the plan of the Narcotic Commission to allow habitues to obtain narcotics on a permanent prescription, to be issued by their physician and endorsed by the Commission, was considered from many points of view. All favored the idea of restricting the sale of narcotics.

After receiving an application for membership, the Branch adjourned.

W. R. WHITE, Sec'y.

PITTSBURGH BRANCH.

(January Meeting.)

The meeting of the Pittsburgh Branch of the A. Ph. A. for the current month was delayed for one week owing to the absence from the city of the secretary. It was held Friday evening, January 16, and in point of attendance was most successful. The number of students present was gratifying, as was also the presence of many ladies.

The only business taken up was the election of officers. The personnel of the nominees was given in the last issue of this JOURNAL, and as there were no new nominees submitted, the ticket recommended by the Committee on Nominations was unanimously elected.

The feature of the evening, the promise of which it was that brought out the unusually large audience, was the presentation by the aid of hand-colored lantern slide pictures, and descriptive lecture, by George B. Parker, Esq., of the wild flowers of nearby counties, and no one present was in the least disappointed in their most sanguine expectations of a rare treat. The delicate coloring in natural shades of the various flowers proved a continual source of wonder and appreciation, and it was clearly evident that in the production of them Mr. Parker must have had a severe strain on his patience, who explained that it was only possible by the use of the microscope while it was under way. Every plant and flower thrown upon the screen had been photographed by Mr. Parker during numerous rambles over the surrounding territory contiguous to Pittsburgh. His collection is extremely rich in number as well as in detail. Mr. Parker claims that he is not a botanist, but merely a lover of the plants and flowers as they grow in their

natural environments; he submitted no illustrations of cultivated specimens. It is Mr. Parker's intention to present his valuable and interesting collection to the Pittsburgh Camera Club, a body of amateur photographers, and each member with a hobby. This disposition of the collection will place it where it can be secured for use in interesting the pupils of the schools of the city in the study of flowers and plants. The gentleman was the recipient of a very enthusiastic vote of appreciation of the instruction and entertainment he had so kindly given.

Dr. Louis Saalbach was on the program for a report on the proposed changes in the United States Pharmacopoeia, but owing to the serious illness of his mother, whose life is despaired of, he was not able to be present, nor in a mental condition to prepare the paper on the assigned topic.

B. E. PRITCHARD, Secretary.

The Pharmacist and the Law

ABSTRACT OF LEGAL DECISIONS.

VOID ORDINANCE LICENSING SELLERS OF SOFT DRINKS—RECOVERY OF LICENSE FEES PAID. A firm of druggists in a city of the fourth class in Kentucky were engaged in selling soft drinks as a part of their business. In April, 1910, at the solicitation of a number of persons who were engaged in that business, or that desired to engage in it, in the city, the board of councilmen adopted an ordinance providing for licensing the sale of soft drinks in the city, fixing the license fee at \$200 per annum, payable quarterly. The firm in question obtained the required license, and continued to do business thereunder for 18 months, during which period they paid license fees aggregating \$300. In September, 1912, the firm brought action against the city to recover that sum, upon the ground that it had been paid through mistake, and collected without authority of law. The want of authority upon the part of the city to collect the license fee appeared, for the first time, shortly before the action was brought, when the firm discovered that the ordinance of April, 1910, was void, because the yeas and nays of the vote upon its adoption had not

been recorded in the journal of the proceedings of the board of council.

The rule in most jurisdictions is that money paid under a mistake of fact can be recovered, but money paid under a mistake of law cannot be recovered. But it has long been settled in the Kentucky courts that in that state money paid under a mistake of law may be recovered. The court of appeals of the state upholds the wisdom of the Kentucky rule on the ground that one is much more inclined to make a mistake of law than a mistake of fact. One of the modifications of the Kentucky rule, however, is that illegal taxes paid voluntarily may not be recovered; but, if they are paid under compulsion, which exists whenever they are collectible by summary process of fine and imprisonment, they come within the general rule and may be recovered. When taxes can be collected by suit only, and are voluntarily paid, an action to recover them cannot be brought. All the requisites of a compulsory payment appearing in this case, judgment for the defendants was reversed and the cause remanded for further proceedings consistent with the opinion of the appellate court.—*Spalding v. City of Lebanon, Kentucky Court of Appeals*, 160 S. W., 751.

SALE OF UNDIVIDED INTEREST IN STOCK—BULK SALES LAW. The sale of a half interest in a stock of goods by a merchant for the purpose of taking the vendee into partnership is held to be within the purpose and reason of the Tennessee Bulk Sales Law (Acts 1901, c. 133), requiring that notice shall be given to creditors, etc., since it very materially changes the relation of the vendor's creditors to the stock, if such sale is valid. Before the sale a creditor could levy upon the whole stock. After the sale, if valid, the creditor could not levy upon any of the stock, but only upon the vendor's interest in the whole, and in order to obtain this he would have to file a bill in equity and have an accounting with the new partner. So the former owner of the stock might admit three new persons into the business, and so reduce his own holding to a one-fourth interest, and so on as to small fractions—at the same time putting the proceeds into his own pocket and holding them beyond the reach of his creditors.—*Daly v. Sumpter Drug Co., Tennessee Supreme Court*, 155 S. W., 167.

AGENCY CONTRACT OR ABSOLUTE SALE. Action was brought for goods sold and deliv-

ered, to recover for certain proprietary medicines alleged to have been sold by a proprietary medicine company to the defendant Bates. The defendant Eastgate guaranteed the contract. The plaintiff was the owner by purchase from the receiver of the medicine company. The vital question in the case was whether the contract, which was in writing and complete in itself, was a contract of absolute sale, making Bates liable, upon its termination, for the stipulated price of the goods which he ordered.

The contract recited a desire on the part of Bates to purchase of the medicine company, on credit and at wholesale prices, for the purpose of selling again to consumers, certain medicines and other goods manufactured or distributed by the medicine company, paying his account in installments as provided in the contract. Bates was to sell no other goods than those sold by the company, was to sell at retail prices fixed by the company, and was to pay on the basis of the wholesale prices fixed by the company. He was to remit to the company in cash each week an amount equal to one-half of the receipts of his business, of which he was to submit weekly reports. Upon the termination of the contract he was to settle in cash within a reasonable time the balance due the company on account. The company agreed to fill and deliver his reasonable orders, provided his account was in a satisfactory condition, and to charge current wholesale prices and to notify him promptly of any change in wholesale or retail prices. It agreed to pay any license fee required by the state or county. It agreed to furnish advertising matter, reports and other blanks. It agreed to give, free of charge, instructions and advice by letter, bulletins, and otherwise, as to the best method of selling products to consumers. Bates and his guarantor were to be released from the contract at any time by paying in cash the balance due the company on account. The contract was to continue so long only as his account and amount of purchases were satisfactory to the company. Concurrently with this contract it was agreed, by another contract in writing, that so long as Bates worked continuously selling the company's medicines it would not sell to anyone else to peddle in Cottonwood county, Minn., but if the contract was terminated the company might sell as if the agreement had not been made. The

so-called guaranty was a guaranty of "the honest and faithful performance of the said contract."

The court construed the contract not to be an absolute sale contract, making Bates liable for the wholesale price of merchandise unsold when the company terminated the contract, but to be in the nature of agency contract, notwithstanding that it did not expressly provide for a return of the merchandise unsold. Judgment for the defendants was therefore affirmed. The court stated that it had found no case construing a contract precisely like this one.—*Barkerville v. Bates, Minnesota Supreme Court, 143 N. W., 909.*

FOOD ORDINANCE—VALIDITY. A conviction was had under an ordinance providing that no unwholesome meat "shall be brought into this city or offered for sale." The statute under which the ordinance was passed (Board of Health, 2 Comp. St., 1910, p. 2063, 12), gives to local boards of health power to pass ordinances "to prevent the sale or exposure for sale" of meat unfit for food. The ordinance was therefore held, on appeal, not to be within the power conferred upon local boards of health excepting in so far as it prohibited the "offering for sale" of unsound food. The defendant was not charged or convicted of offering the meat for sale, but only for bringing it into the city, a prohibition that was held to be beyond the power conferred by the Legislature.

Whether an ordinance would be valid that prohibited the bringing into the city of unsound meat for the purpose of offering it for sale for human food was not considered by the court, as neither the ordinance nor the complaint under which the defendant was convicted made any such qualification. The conviction was set aside.—*Silverman v. Board of Health of City of Bridgeton, New Jersey Supreme Court, 88 Atl., 622.*

OVERREADING CREAM TEST—INTENT. An information charged the defendant with wilfully and unlawfully violating the Nebraska pure food law by overreading a test of cream purchased by him for commercial purposes. The statute (Comp. St., 1911, c. 33, 20), makes it unlawful for any person to "over-read or underread, or in any other manner make, announce or record any false or untrue test of either butter or cream." It was contended by the defendant that the information

was defective in failing to charge that the act was committed with the intent to defraud, that the result of overreading the test was to pay too much for the cream, and that the defendant did not cheat or intend to defraud anyone. It was held that the information was sufficient, intent not having been made by statute an element of the offense.—*State v. Thorp, Nebraska Supreme Court, 143 N. W., 202.*

REIMPORTATION OF REJECTED TEA. In a libel for the forfeiture of certain chests of tea rejected by the customs examiner and released and exported under the provisions of Act March 2, 1897, c. 358, 9, 29 Stat., 606 (U. S. Comp. st., 1901, p. 3197), being "an act to prevent the importation of impure and unwholesome tea," it appeared that the tea had, after rejection, been shipped to Canada and sold there and afterwards reimported into the United States. Section 9 of the statute provides that "no imported teas which have been rejected and exported under the provisions of this act shall be reimported into the United States under the penalty of forfeiture for a violation of this prohibition." It was held that any person offering tea for import is bound to know whether or not it has previously been offered and rejected, and if it has he cannot be relieved from the penalty of forfeiture because he did not in fact know but offered it in good faith.—*U. S. v. Twenty Chests of Tea, 298 Fed., 89.*

CLEANSING MILK BOTTLES. The New York Court of Appeals has affirmed the decision of the Appellate division in *People v. Frudenberg, 155 App. Div., 199, 140 N. Y. Supp. 17*, sustaining a conviction of having received milk bottles which had not been washed after holding milk. The proceedings were brought under New York City Sanitary Code, section 183, the last clause of which declares that no person shall receive or have in his possession any receptacle for the transportation of milk or cream which has not been washed after holding milk or cream. The ordinance was challenged by the defendant as being in violation of the Constitution, for the reason that that clause prevents the owner of a receptacle which has contained milk from reclaiming his property if the receptacle is unclean. It was held that the clause did not have this result, the word "or" being here equivalent to "and," but it cast upon the dealer retaking uncleaned milk bottles the burden of immedi-

ately cleansing the receptacle. The statute being designed to protect the public health, it was held that it should receive at the hands of the court a liberal interpretation. The expression "immediately" in the clause requiring bottles to be cleansed "immediately upon emptying" was construed to mean "forthwith," and as implying prompt and vigorous action and the statute was held to be a valid police regulation.—*People v. Frudenberg*, 103 N. W., 166.

FOOD—"ADULTERATED" OYSTERS—KNOWLEDGE AND INTENT. In a prosecution for violation of the federal food and drugs act by shipping from the state of New York to Pennsylvania 10 barrels of oysters, it was charged that the oysters were "adulterated" in that they "consisted in part of filthy, decomposed and putrid animal and vegetable substance." It was held that oysters, although shipped unopened as taken from the water, may come within the prohibition of the statute where by reason of the condition of the waters in which they are grown they contain harmful bacteria, which renders them "filthy, decomposed, or putrid," and therefore adulterated within section 7, subd. 6, of the act.

Section 2 of the act provides that the shipment or delivery for shipment in interstate commerce of any article of food or drugs which is adulterated or misbranded shall constitute a misdemeanor. It was held that it is no defense to claim that the person causing the violation neither knew at the time that the goods were offensive, nor intended to violate the law. Hence an allegation that the defendants knew that the article was adulterated, at the time that they intentionally and wilfully shipped it or caused it to be shipped, would apply only to cases where the adulteration had been placed in the goods by or with the knowledge of the shipper, or where an examination of the article had disclosed its presence. But Congress has gone much further, and in the exercise of its police power has imposed a penalty upon the sending of the deleterious or harmful substance, where the shipper is responsible for the act of sending, even though he may have nothing to do with the condition of the article sent, except as possession or ownership makes him responsible.

The ordinary use of the word "adulteration" implies an actual addition to the original substance, through human agency; but

as used in the food and drugs act, section 7, subd. 6, the meaning is not so restricted. If the adulteration of filthy, decomposed, or putrid substance has been added by nature, and is contained in the article to be shipped, it is adulterated in the eyes of the law.—*U. S. v. Sprague*, 208 Fed., 419.

MISBRANDING—"WINE." In proceedings for misbranding wine in violation of the federal pure food and drugs act, the defendant's shipments purported to be Rhine wines of the character known as Hockheimer and Diedesheimer, whereas the article in each instance was an Ohio manufactured product, and a mixture of wine and a fermented solution of commercial dextrose, or starch sugar. It was held that section 6 of the act, defining the term "food" to include all articles used for food, drink, confectionery, or condiment, by man or other animal, whether simple, mixed, or compound, applies to and includes wine. It was contended that section 8 of the act relating to misbranding is void for not establishing a standard for the various wines enumerated in the indictment. It was held that this contention would make it practically impossible for Congress to pass an act to correct the evils at which the statute is aimed, for the reason that it would be necessary, not only to amplify the act with very particular and minute definitions of standards, but to be constantly amending it and supplementing it as new devices and compounds were placed upon the market. The name "wine" is usually understood to mean the fermented juice of the undried grape. All that Congress can do is to pass a statute in general terms, using words of ordinary acceptance.—*U. S. v. Sweet Valley Wine Co.*, 208 Fed., 85.

<>

ABSTRACT OF TREASURY DECISIONS.

DRAWBACKS ON MEDICINAL PREPARATIONS, ETC. The following drawbacks on medicinal preparations, etc., have been allowed by the Treasury Department:

Prepared talcum powder designated as "Eutaska," manufactured by the Andrew Jergens Co. of Cincinnati, Ohio, with the use of imported talcum powder in conjunction with domestic ingredients. (T. D. 33582.)

Medicinal and toilet preparations and perfumes manufactured by the J. K. Watkins

Medical Co., of Winona, Minn., with the use of domestic tax-paid alcohol. (T. D. 33626.)

Alvatunder, manufactured by the Hisey Manufacturing Co., of St. Louis, Mo., with the use of imported cocaine. (T. D. 33629.)

Dr. S. P. Townsend's sarsaparilla, manufactured by the Nostrand Trading Co., of Brooklyn, N. Y., either with the use of imported alcohol or with the use of domestic tax-paid alcohol. (T. D. 33648.)

Atwood's Bitters, manufactured by O. H. Jadwin & Sons (Inc.), of New York, N. Y., either with the use of domestic tax-paid alcohol or imported alcohol. (T. D. 33672.)

Medicinal preparations, manufactured by Parke, Davis & Co., of Detroit, Mich., with the use of imported morphine, or its derivatives, codeine or cocaine, or the salts of the same. T. D. 33675.)

Various perfumes, manufactured by Richard Hudnut, of New York, N. Y., with the use of domestic tax-paid alcohol. (T. D. 33676.)

Medicinal preparations, manufactured by C. S. Littell & Co., of New York, N. Y., with the use of domestic tax-paid alcohol. (T. D. 33685.)

Medicinal preparations, manufactured by B. S. McKean, of New York, N. Y., with the use of domestic tax-paid alcohol. (T. D. 33713.)

Medicinal preparations, manufactured by McKesson & Robbins, of New York, N. Y., with the use of domestic tax-paid alcohol. (T. D. 33820.)

Prepared talcum powder, manufactured with the use of imported talc and toilet preparations manufactured with the use of domestic tax-paid alcohol by C. H. Selick, of New York, N. Y. (T. D. 33942.)

Medicinal preparations designated as Kickapoo Sagwa and Kickapoo Oil, manufactured by William R. Warner & Co., of Philadelphia, Pa., with the use of domestic tax-paid alcohol. (T. D. 33974.)

Medicinal preparations, manufactured by Peek & Velsor, of New York, N. Y., with the use of domestic tax-paid alcohol. (T. D. 33993.)

KAM WO TEA. Collectors are instructed that Kam Wo Cha, or Kam Wo Tea, is classed by the Secretary of Agriculture as a drug under the food and drugs act, and should be assessed with duty and should not be examined under the tea act of March 2, 1897. (T. D. 33910.)

MALT EXTRACT IN DRUMS. Paragraph 309, tariff act of 1909, imposes a duty of 45 per cent. ad valorem on malt extract when solid or condensed without regard to coverings and in whatever form it may be packed for shipment. (T. D. 33920.)

CRUDE OPIUM—DRIED OPIUM. Opium obtained by collecting in containers the sap of the poppy-seed pod and allowing it to stand until a percentage of the water in it evaporates, after which it is spread upon boards, exposed to the heat of the sun, and while being dried is manipulated and later cut into the form of cakes, is not "crude" opium, but is "opium, dried, * * * or otherwise advanced beyond the condition of crude," as provided for in paragraph 41, tariff act of 1909. G. A. 7001 (T. D. 30487, and U. S. v. Dauker (2 Ct. Cust. Appls. 522; T. D. 32251 distinguished (T. D. 33788—G. A. 7501).

CODEIN. Codein pays a duty as an alkaloid of opium under the language of paragraph 43, act of 1897, and paragraph 41, tariff act of 1909, whether manufactured from opium or synthetically from morphia. Abstract 5493 (T. D. 26218) followed, and the doctrine of that case extended to include codein synthetically prepared from morphia. (T. D. 3398—G. A. 7517.)

NOTICES OF JUDGMENT.

ADULTERATION AND MISBRANDING OF VANILLA EXTRACT BY SUBSTITUTING IMITATION. No. 2494. Herman Fuchs, New York, N. Y. Plea of guilty. Sentence suspended. New York. S.

No. 2592. Greenwich Supply Co., N. Y., N. Y. Condemnation by default. N. J.

No. 2617. Dr. Lowenthal, New Rochelle, N. Y. Condemnation by default. N. J.

ADULTERATION AND MISBRANDING OF STRAWBERRY FLAVOR. No. 2495. Substitution of water, alcohol, sugar and artificial esters. Herman Fuchs, New York, Plea of guilty. Sentence suspended.

MISBRANDING OF HEADACHE TABLETS. No. 2578. Quantity of acetanilid overstated. Allaire, Woodward & Co., Peoria, Ill. Plea of guilty. Fine, \$10 and costs. Ill. S.

MISBRANDING OF LITHIA WATER. No. 2585. Artificially prepared. Berry Spring Lithia Water Co., Providence, R. I. Nolo contendere. Fine, \$20 and costs. R. I.

MISBRANDING OF CANDY. No. 2591. Syra-

Lukum, purported to be a foreign product. A. C. Castriotis and S. Vocos. Plea of guilty. Sentence suspended. New York. S.

ADULTERATION AND MISBRANDING OF VANILLA AND LEMON FLAVOR. No. 2609. Dilution. Dr. J. B. Lynas & Son, Logansport, Ind. Plea of guilty. Fine, \$200 and costs. Indiana.

ADULTERATION AND MISBRANDING OF EXTRACT OF FRUITED LEMON. No. 2618. Diluted with solution of lemon extract. Royal Mfg. Co., Kansas City, Mo. Plea of guilty. Fine, \$25 and costs. Missouri. W.

ADULTERATION AND MISBRANDING OF ORANGE EXTRACT. No. 2619. Diluted with terpeneless solution of orange extract. Royal Mfg. Co., Kansas City, Mo., Plea of guilty. Fine, \$50 and costs. Missouri. W.

Council Business

COUNCIL LETTER No. 8.

PHILADELPHIA, PA., Dec. 26, 1913.

To the Members of the Council:

Local Secretary Leonard A. Seltzer submits, on behalf of the Local Committee, the following tentative program for the Sixty-second Annual Meeting (August 24 to 29, 1914, inclusive):

Monday—

- 9.00 A. M. Meeting of the Council.
- 3.00 P. M. House of Delegates.
- 7.30 P. M. First General Session.
- 9.30 P. M. Joint Reception of the Presidents of the A. Ph. A. and M. S. P. A.

Tuesday—

- 9.30 A. M. Second General Session.
- 9.30 A. M. First General Session, M. S. P. A.
- 10.00 A. M. Ladies Shopping and Visiting, etc.
- 2.30 P. M. Women's Section.
- Scientific Section.
- Joint Sessions of Commercial Section and M. S. P. A.
- 7.30 P. M. House of Delegates.
- 7.30 P. M. Meeting of the Council.

Wednesday—

- 9.30 A. M. Section Education and Legislation.

- 9.30 A. M. Pharmacopœias and Formularies.

- 12.30 P. M. Luncheon College Alumni.

- 2.30 P. M. Section Practical Pharmacy and Dispensing.

- 2.30 P. M. Scientific Section.

- 4.00 to 6.00 P. M. Ladies' Reception.

- 7.30 P. M. Meeting of the Council.

Thursday—

- 9.30 A. M. Section Education and Legislation.

Joint Session Practical Pharmacy and M. S. P. A.

- 1.30 P. M. Excursion.

Friday—

- 9.30 A. M. Historical Pharmacy.
- Pharmacopœias and Formularies.

Women's Section.

Commercial Section.

- 2.30 P. M. Auto Ride.

- 8.00 P. M. Meeting of the Council.

Saturday:

- 9.30 A. M. Meeting of the Council.

- 10.30 A. M. General Session.

Do you approve of tentative program above submitted? This will be regarded as Motion No. 18. (*Approval of Tentative Program for 62d Annual Meeting.*)

In support of the program, as above outlined, Local Secretary Leonard A. Seltzer submits the following remarks:

"Enclosed herewith you will find tentative program which the local committee desires to submit to the Council for its approval. Later on we expect to make a few minor additions, such as entertainment for ladies, etc., but this will have no bearing on the program as presented.

The Michigan State Association has decided to hold its meeting in Detroit at the same time the meeting of the A. Ph. A. takes place. The local committee has encouraged this idea, believing that it will bring many men from the state to attend the meeting, who will thus become acquainted with our organization and its work, and we hope join with us. To help in accomplishing this purpose, the committee has therefore provided for two joint sessions with the Sections of our Association, and also a joint reception of the presidents of the two organizations. We sincerely hope that we have not taken unwarranted liberty in

this matter, and that our action will meet with your approval.

The program as presented has several features which are radical departures from former programs, and we desire to call your attention to them and give the reasons for recommending them.

First. We recommend that the Council, after the first day, hold its sessions in the evening.

Second. We have provided for two sessions for each Section except the Historical, and when simultaneous sessions are held, they have been selected with reference to their subjects so as to be least in conflict with each other.

Third. As a result of this arrangement, the evenings are all left open for Council meetings, adjourned sessions or pleasure.

The custom most strongly entrenched, and to change which requires good reasons for so doing, is the morning Council meetings. It is very evident that each year we have become more and more crowded for time, and this is *not all* due to the amount of business done, but almost entirely to the uneconomical use of time. One of the greatest obstacles to the economical use of our time is the meeting of the Council in the morning. The fact is, that even if its sessions were called on time, (which will never be) the Council could not possibly finish its business until well along in the forenoon. The fact, moreover, that the Council includes in its membership all the chairmen of the Sections, as well as the more active members of the Association, renders it impracticable to expect any session to be called until after it has adjourned. If the Council do not meet in the morning, the sections can be called earlier, and by means of an increased length of the morning sessions they will be able to complete their business in the two sessions allotted them.

We sincerely hope that the Council will see fit to give this proposal a trial for one year at least, and see whether it will not obviate difficulties under which we labor at present and which must find some solution in the near future."

General Secretary Beal, and Chairman Snow of the House of Delegates both approve of the change of the hour for Council meetings from the morning to the evening, except on the first day of the Convention, and of holding the first session of the House

of Delegates at the time hitherto devoted to the first General Session, the latter being dropped to the hour of 7.30 p. m.

This change would be made with the expectation that the greetings from other associations which send delegates will be delivered to the House of Delegates instead of, as heretofore, to the General Session, thus leaving much more time for the really necessary business that must come before the latter.

J. W. ENGLAND,

Secretary of the Council.

415 N. 33d St.

<>

COUNCIL LETTER No. 9.

PHILADELPHIA, PA., Dec. 31, 1913.

To the Members of the Council:

Motions No. 14 (Appropriation of \$25 for National Drug Trade Conference), No. 15 (Election of Members; applications Nos. 18 to 24, inclusive), No. 16 (Approval of Budget of Appropriations for 1914), and No. 17 (Appropriation of \$250 for Badges and Pin Buttons), have each received a majority of affirmative votes.

With reference to *Motion No. 18 (Approval of Tentative Program for the 62d Annual Meeting)*, Caswell A. Mayo votes affirmatively on the motion and writes, "I move that the 'Tentative Program for the 62d Annual Meeting' be published and criticism and comments be invited before final adoption." The motion is seconded by J. W. England. It will be regarded as *Motion No. 19 (Publication of Tentative Program for the 62d Annual Meeting)*.

Comments and criticisms on the Program should be sent to the Secretary of the Council, J. W. England, 415 N. 33d St., Philadelphia, Pa., and will be referred by him to the committee having the matter in charge—the General Secretary, Secretary of the Council and the Local Secretary.

Regarding the subject of Badges, L. E. Sayre writes as follows: "I would like to suggest that in the future all local badges should be abandoned except for the purpose of identifying the name of the individual who attends the meeting. Some arrangement should be made by which the individual name can be inserted in the local badge to promote acquaintanceship and the social features of our meetings. We come together partly to get acquainted with new men and to renew acquaintance of the old members. The

new Association badge should be considered as of the greatest importance and should be worn on occasions of our annual meeting."

The following communication has been received from Henry B. Floyd, Secretary of the Washington Branch of the American Pharmaceutical Association:

"To the President, and Members, the Council, American Pharmaceutical Association:

The following is a copy of a resolution made, and carried, at the meeting of the City of Washington Branch, American Pharmaceutical Association, held December 17, at Washington, D. C. I am directed to bring such resolutions to your attention by the vote of said Branch.

WHEREAS, It has been proposed to provide a permanent home and headquarters for the American Pharmaceutical Association, and

WHEREAS, Efforts have been made, and are now being made to secure the location of this permanent home or headquarters in several widely separated cities, and

WHEREAS, The American Pharmaceutical Association is an incorporated body under the laws of the District of Columbia, and is now operating under the general provisions of this incorporation; now,

Therefore, We, the members of the City of Washington Branch of the American Pharmaceutical Association would respectfully remind the officers and Council of the parent organization that there are many and weighty reasons for locating said permanent home or headquarters of the American Pharmaceutical Association in the City of Washington, in the District of Columbia.

It is proper to state that during the discussion of the resolution that the following reasons were strongly brought out: Washington is the political national center, but free from local politics: It is the true home of the parent organization: The Association officers would be in closer touch with national affairs: It is the most visited city in the Western Hemisphere: Its libraries are unequalled in the United States: Its museums are not to be found in other cities: It is the home of the Bureau of Chemistry of the Department of Agriculture, and all other government departments which exert controlling interests over pharmacy, and the pharmacist: Its publishing facilities are good, and Baltimore, one of the cheapest printing centers in the United States, is exceedingly convenient: It is the National Capital, and therefore, the local home for any national organization.

As an example of a national organization which has its publishing done in the City of Washington where its permanent home is located the National Geographic Society was

cited. There are other such organizations, but not of such national prominence.

Respectfully submitted,

HENRY B. FLOYD,

Secretary and Member of Council."

Washington, D. C., December 24, 1913.

Motion No. 20 (Election of Members).

You are requested to vote on the following applications for membership:

No. 25. Jacob Weinkauff, 600 5th Ave., Peoria, Ill., rec. by C. W. Patterson and M. A. Miner.

No. 26. Sidney Frederick Fieselmann, 1106 Perry Ave., Peoria, Ill., rec. by C. W. Patterson and M. A. Miner.

No. 27. Adolph M. Kishon, Sgt. Hosp. Corps, U. S. A., Post Hospital, Fort D. A. Russell, Wyo., rec. by Harry M. Jennings and Wm. B. Day.

No. 28. Albert August Muench, 608 N. Salina St., Syracuse, N. Y., rec. by George C. Diekmann and Clarence O. Bigelow.

No. 29. Edward Hoffmann, 4024 5th Ave., Brooklyn, N. Y., rec. by Hugh Craig and J. H. Rehfuess.

No. 30. B. E. Glockler, 4831 Liberty Ave., Pittsburgh, Pa., rec. by Herman G. Blank, Jr., and J. H. Beal.

No. 31. Milton J. Seeley, Room 217, Science Hall, Corvallis, Oregon, rec. by W. S. Hubbard and A. B. Stevens.

No. 32. William Scott Howson, Sergeant, First Class, Hospital Corps, U. S. Army, Camp E. S. Otis, Las Cascadas, Canal Zone, Panama, rec. by W. B. Day and A. H. Clark.

No. 33. Robt. A. Doyle, East Prairie, Mo., rec. by Jerome A. Wilkerson and H. M. Whelpley.

J. W. ENGLAND,

Secretary of the Council.

415 N. 33d Street.

COUNCIL LETTER No. 10.

PHILADELPHIA, PA., January 21, 1914.

To the Members of the Council:

The Committee on Publication submit the following report:

At the Nashville (1913) meeting the following resolution was adopted by the Council and approved by the Association: "On motion of J. W. England, seconded by W. B. Day, the Committee on Publication was authorized to employ an advertising solicitor and assistant to the Editor of the JOURNAL, at a salary to be fixed by the Committee on Publication, subject to the approval of the Committee on Finance and the Council."

Since the annual meeting the Committee on Publication has given careful and

thorough consideration to the selection of the official authorized by the above resolution. Seven applications have been received. Several personal conferences of members of the committee have been held and the choice has finally crystallized.

The committee feels that while the assistant employed should assist the Editor in getting out the JOURNAL, and do such clerical work as might be referred to him by the General Secretary, his principal duty should be to secure advertising for the JOURNAL, and his title should be "Advertising Manager," instead of the cumbersome title "Advertising Solicitor and Assistant to the Editor of the JOURNAL," and the committee so recommends. The work of the Advertising Manager should be, of course, under the direction of the Editor and General Secretary, as it would be inexpedient to have more than one head for the management of the JOURNAL or the duties of the Secretary.

The consensus of opinion of the committee is that the Advertising Manager, working under the direction of the Editor and General Secretary, should be developed into a useful assistant and relieve that official of much of the executive details with which he is overburdened, so that he would have more time to devote to the larger work of the Association.

Acting under the authority of the Nashvill resolution, the Committee on Publication has elected Ernest C. Marshall as Advertising Manager to take effect as soon as arrangements can be made for him to move to Columbus, Ohio, and assume the duties of the office, at a compensation for services as given below; and asks your approval of its action.

The following plan of compensation has been agreed upon by the Committee on Publication:

"That the Advertising Manager be given an annual salary of fifteen hundred (\$1500) dollars, plus 20 percent for commissions on advertisements up to a maximum of one thousand dollars, and 10 percent on all advertisements he secures through outside solicitors working under his direction, to pay the latter. (The current advertisements in the JOURNAL or their renewals, do not, of course, enter into the calculations for commissions). In this way, the Advertising Manager could not receive more than \$2500 a year. On the other hand, the Association could receive,

if secured, about \$5000 more in advertisements, which, added to our present advertising receipts for the year (\$3600) would make about \$8600 a year, less \$1000 paid for commission, or a net total of \$7600, instead of \$3600, as at present.

The Committee on Finance approves the above plan of compensation for the Advertising Manager.

Ernest C. Marshall is a graduate of the Massachusetts College of Pharmacy and has been a trustee and vice-president of this corporation. He has been a student of pharmacy and pharmaceutical affairs for many years. He is a member of the American Pharmaceutical Association. He has had considerable business experience outside of pharmacy, having been institutions commissioner and penal institutions commissioner of Boston for several years; also a councilman of that city. As to his literary ability, he has written occasionally for newspapers, and has been the Boston correspondent of the N. A. R. D., and has written the New England letter for the JOURNAL of the A. Ph. A. He has written a number of news articles for different pharmaceutical journals. Regarding his advertising experience, he has been a solicitor of advertising for more than ten years, and is at present the advertising representative of the Journal of the N. A. R. D. for New England. He is a member of the Publicity Club of Boston, an organization composed of New England advertising men.

Mr. Marshall would accept the terms and conditions of employment agreed upon by the Committee on Publication.

The election of Mr. Marshall as Advertising Manager would be acceptable to Editor and General Secretary Beal.

It will be recalled that when the Committee on Publication reported favorably upon the publication of the monthly JOURNAL of the A. Ph. A., it recommended the engagement of a business manager to look after the advertising, as well as an editor to perform the strictly editorial duties. The desire of the committee to economize while the JOURNAL was going through the period of establishment was so strong that such an aid to the Editor was not provided. Dr. Beal has been permitted to bear all the burdens and detail of the publication, and the success of the JOURNAL is mainly due to his untiring energy and devotion to the interests of the Associa-

tion. The success of the JOURNAL is now assured, and it will be unfair to delay any longer the selection of a suitable assistant to look after the advertising and business interests. Dr. Beal's health should be conserved, and he should be relieved, as promptly as possible, of much of the worrying over details and carrying on the dual duties of Editor and business-getter.

The Committee on Publication expresses the hope, also, that, with increased success of the JOURNAL and the expected prosperity, the financial condition will, in the future, permit the employment of such additional assistance to the Editor as may become necessary. The immediate problem, however, is the employment of an Advertising Manager.

Respectfully submitted,

J. W. ENGLAND,
Chairman.

Do you approve of the report of the Committee on Publication, with its recommendations, and authorize the committee to employ Ernest C. Marshall under the conditions stated? This will be regarded as Motion No. 21 (*Approval of Report of Committee on Publication.*)

J. W. ENGLAND,
Secretary of the Council.

415 N. 33rd St.

UNITED STATES PUBLIC HEALTH SERVICE.

(List of changes of stations and duties of commissioned and other officers of the United States Public Health Service):

Austin, H. W., Senior Surgeon. Detailed to represent the Service at the National Conference on Race Betterment to be held at Battle Creek, Michigan, Jan. 8-12, 1914. Dec. 27, 1913.

Banks, C. E., Senior Surgeon. Granted 8 days' leave of absence from Dec. 14, 1913. Dec. 13, 1913.

White, J. H., Surgeon. Directed to proceed to St. Joseph, Mo., to make a sanitary survey of that city and to advise with the health authorities regarding the reorganization of their health service. Dec. 23, 1913.

McIntosh, W. P., Surgeon. Relieved from duty at Louisville, Ky., and directed to proceed to Portland, Me., and assume charge

of the Marine Hospital at that port. Dec. 15, 1913.

Wertenbaker, C. P., Surgeon. Directed to proceed to Charleston Quarantine Station on special temporary duty. Dec. 19, 1913.

Gardner, C. H., Surgeon. Granted 2 days' leave of absence from Dec. 25, 1913, under paragraph 193, Service Regulations. Dec. 24, 1913.

Lavinder, C. H., Surgeon. Granted 21 days' leave of absence from Dec. 21, 1913. Dec. 23, 1913.

Anderson, J. F., Surgeon. Reassigned to duty as Director of the Hygienic Laboratory, effective Oct. 1, 1913. Oct. 1, 1913.

Detailed to attend the annual meeting of the American Society for Experimental Pathology to be held in Philadelphia, Pa., Dec. 29-31, 1913. Dec. 22, 1913.

Fox, Carroll, Surgeon. Granted 2 days' leave of absence Dec. 26-27, 1913. Dec. 23, 1913.

Schereschewsky, J. W., Surgeon. Detailed to attend the seventh annual meeting of the American Association for Labor Legislation at Washington, D. C., Dec. 30-31, 1913. Dec. 29, 1913.

Directed to proceed to Youngstown, O., and make an investigation into the origin and prevalence of trachoma in that city. Also to Dayton, O., to inspect sanitary conditions in manufacturing establishments. Dec. 29, 1913.

McLaughlin, A. J., Surgeon. Granted 3 months' leave of absence without pay, from Jan. 1, 1914. Dec. 18, 1913.

Francis, Edward, Surgeon. Reassigned to duty as Assistant Director of the Hygienic Laboratory, effective Oct. 7, 1913. Dec. 16, 1913.

Granted 17 days' additional leave of absence from Dec. 12, 1913. Dec. 17, 1913.

Warren, B. S., Surgeon. Detailed to attend the seventh annual meeting of the American Association for Labor Legislation at Washington, D. C., Dec. 30-31, 1913. Dec. 19, 1913.

Foster, A. D., Passed Assistant Surgeon. Granted 7 days' leave of absence from Dec. 20, 1913. Dec. 20, 1913.

Frost, W. H., Passed Assistant Surgeon. Granted 2 days' leave of absence, Dec. 24-25, 1913. Dec. 23, 1913.

BOARDS CONVENED.

Board of medical officers convened to meet at the Bureau, Monday, January 12, 1914, at 10 o'clock a. m., for the examination of candidates to determine their fitness for appointment as Assistant Surgeon in this Service. Detail for the board: Assistant Surgeon General W. G. Stimpson, chairman; Assistant Surgeon General W. C. Rucker, member; Assistant Surgeon R. A. Kearny, recorder. Dec. 27, 1913.

Boards of medical officers convened for the physical examination of applicants for appointment as Assistant Surgeons and for the presentation of questions for the written examination, to meet at 10 o'clock a. m., Monday, January 12, 1914, as follows:

Marine Hospital, New Orleans, La., Surgeon J. H. White, chairman; Assistant Surgeon T. J. Liddell, recorder.

Immigration Station, Ellis Island, N. Y., Surgeon L. L. Williams, chairman; Surgeon M. H. Foster, recorder.

Marine Hospital, San Francisco, Calif., Surgeon R. M. Woodward, chairman; Passed Assistant Surgeon J. M. Holt, recorder.

Marine Hospital, Chicago, Illinois, Surgeon J. O. Cobb, chairman; Assistant Surgeon D. S. Baughman, recorder.

Marine Hospital, Chelsea, Mass., Surgeon H. W. Wickes, chairman; Assistant Surgeon Liston Paine, recorder.

Marine Hospital, St. Louis, Mo., Surgeon M. J. White, chairman; Acting Assistant Surgeon H. C. Wakefield, recorder. Dec. 19, 1913.

Wertenbaker, C. P., Surgeon. Granted 7 days' leave of absence from Jan. 1, 1914. Dec. 31, 1913.

Nydegger, J. A., Surgeon. Granted 1 month's leave of absence from Jan. 8, 1914, on account of sickness. Jan. 3, 1914.

Foster, M. H., Surgeon. Directed to proceed to Philadelphia, Pa., for the purpose of observing the Grattage operation for the cure of trachoma. Jan. 3, 1914.

Moore, Dunlop, Surgeon. Directed to proceed to Louisville, Ky., and report to Surgeon J. H. Oakley for duty in the examination of school children of Jefferson County. Jan. 5, 1914.

Korn, W. A., Surgeon. Granted 1 month's leave of absence, to be taken when the work of the station will permit. Jan. 6, 1914.

Boggess, J. S., Surgeon. Directed to su-

pervise the fumigation of the steamer Newlands at the wharves in Mobile. Jan. 5, 1914.

Guthrie, M. C., Passed Assistant Surgeon. Directed to proceed to Wheeling, W. Va., for the purpose of making a further examination of two aliens to observe the results of the Grattage operation for the cure of trachoma. Jan. 5, 1914.

Kolb, L., Passed Assistant Surgeon. Directed to proceed to Louisville, Ky., and report to Surgeon J. H. Oakley for duty in the examination of school children of Jefferson County. Jan. 5, 1914.

Safford, M. V., Assistant Surgeon. Directed to proceed to Worcester, Mass. for the purpose of making a further examination of an alien to observe the results of the Grattage operation for the cure of trachoma. Jan. 3, 1914.

Voegtlin, Carl, Professor of Pharmacology. Detailed to attend the meetings of the American Pharmacological Society and the American Physiological Society in Philadelphia, Pa., Dec. 29-31, 1913. Dec. 23, 1913.

Roth, G. B., Assistant Pharmacologist. Detailed to attend the meetings of the American Pharmacological Society and the American Physiological Society in Philadelphia, Pa., Dec. 29-31, 1913. Dec. 23, 1913.

BOARDS CONVENED.

Board of medical officers convened to meet at the Bureau for the preparation of questions for the written examination of Assistant Surgeon D. C. Turnipseed at Manila, P. I., to determine his fitness for promotion to the grade of Passed Assistant Surgeon. Detail for the board: Assistant Surgeon General W. G. Stimpson, chairman; Assistant Surgeon General W. C. Rucker, member; Assistant Surgeon R. A. Kearny, recorder. Jan. 6, 1914.

Board of medical officers convened to meet at Baltimore, Md., for the re-examination of alien child Meyer Ewaschnitzki. Detail for the board: Senior Surgeon H. R. Carter, chairman; Surgeon J. A. Nydegger, member; Passed Assistant Surgeon J. T. Burkhalter, recorder.

(List of changes of stations and duties of commissioned and other officers of the United States Public Health Service for the seven days ended January 14, 1914):

Glennan, A. H., Assistant Surgeon General. Granted 1 month's leave of absence from Jan. 19, 1914. Jan. 7, 1914.

Wertenbaker, C. P., Surgeon. Directed to

return to the Delaware Breakwater quarantine station and resume duties relative to detention of vessel at quarantine. Jan. 7, 1914.

Anderson, J. F., Surgeon. Directed to proceed to Providence, R. I., for the inspection of a case of typhus fever landed from an Italian steamship. Jan. 10, 1914.

Salmon, Thomas V., Passed Assistant Surgeon. Granted one year's leave of absence, without pay, Jan. 1, 1914. Jan. 5, 1914.

Bryan, W. M., Passed Assistant Surgeon. Granted 9 days' leave of absence from Dec. 25, 1913. Jan. 7, 1914.

Glanville, W. E., Assistant Surgeon. Granted 8 days' leave of absence, on account of sickness, from Jan. 3, 1914. Jan. 12, 1914.

Mitzmain, M. G., Technical Assistant. Directed to proceed from San Francisco, Cal., to Mobile, Ala., stopping at Washington, D. C., for conference, and report to the medical officer in charge of the Marine Hospital for duty in field investigations of the public health. Jan. 6, 1914.

BOARD CONVENED.

Board of Medical Officers convened to meet at Manila, P. I., for the examination of Assistant Surgeon D. C. Turnipseed to determine his fitness for promotion to the grade of Passed Assistant Surgeon. Detail for the board: Surgeon Victor C. Heiser, chairman. Jan. 9, 1914.

Official:

RUPERT BLUE,
Surgeon General.

MORAL ISSUES AND SELF INTEREST.

A strong tendency to moral arraignment blurs all intellectual issues in the minds of the very stupid. There are certain twisted minds * * * who always make a moral issue of their own interest. It sometimes seems as if they were really following their conscience through thick and thin, and as if their very goodness led them astray. If we look a little closer at their guide we shall see that it is not conscience at all. They have made long the phylacteries of self-interest and are indulging in a moral masquerade. How often do we hear the word "robber" flung about where questions of pure economic expediency are concerned, or a man called a traitor because his political ideal is not that of his opponents! A great deal of this injustice is the direct outcome of a tendency to push the moral issue to the front.—*London Spectator*.

Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,
From 2342 Albion Place, St. Louis, Mo.
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or *type-written*.

BREHLER, OSCAR A.,
From P. O. Box 315, Sanger, Cal.
To P. O. Box 375, Sanger, Cal.

BROWN, L. W.
From Ky. Exper. Station, Lexington, Ky.
To 425 Transylvania Park, Lexington, Ky.

BURDICK, ALFRED S.,
From 2148 Giddings Ave., Chicago, Ill.
To 4753 Ravenswood Ave., Chicago, Ill.

BURDICK, M. M.,
From 4846 W. Hermitage Ave., Chicago, Ill.
To 4846 N. Hermitage Ave., Chicago, Ill.

COLEMAN, JOHN,
From 2500 Chaplin, Wheeling, W. Va.
To 2500 Chapline, Wheeling, W. Va.

FOREMAN, LEROY,
From Philadelphia, Pa.
To 323 Market St., Trenton, N. J.

FRY, N. GEO.,
From 401 North Ave., Chicago, Ill.
To 421 R. North Ave., Chicago, Ill.

HASCHENBURGER, EDMUND, O.,
From 1200 O St., Lincoln Nebr., business address.
To 139 S. 25th St., Lincoln Nebr., residence address.

HENKEL, ALICE,
From Chevy Chase, Md.
To U. S. Dept. Agriculture, Washington, D. C.

HEINRITZ, L. G.,
From 128 South St., Holyoke, Mass.
To 16 Washington Ave., Holyoke, Mass.

HOUND'S TONGUE FOR THE BANISHMENT OF RATS.

According to the *Veterinary Record*, which quotes a German paper, the common hound's tongue, *Cynoglossum officinale*, is a certain agent to secure the banishment of rats. The plant is found on rubbish heaps, in fields, etc. The purple flowers have an unpleasant odor. The freshly dried plants drive away rats by their odor, and, when strewn in a place infested by the rodents, are said to cause the immediate departure of the animals. Stuffing the rat holes with the plants will cause the rats to migrate further and more completely, it is said.—*Pharmaceutical Journal (London)*.

OVERDOING COÖPERATION.

UNDER the stress of cut prices on proprietary articles, the increase of physicians dispensing and the multiplication of medicaments that can be profitably produced only in large establishments, many retail druggists have been lead to experiment with various cooperative plans for manufacturing or purchasing a portion of their supplies, for procuring fire insurance, and for other services by which they hoped to either reduce their overhead expenses or increase their profits on sales, or both.

The object was to substitute the old individualism, with its motto of "every fellow for himself, and the devil take the hindmost" (which he usually did), by the new plan of joining effort, capital and initiative, and mutually sharing the resulting benefits.

Some few of these cooperative enterprises have been conspicuously successful, and through wise and economical management have developed into institutions of considerable size and have accumulated resources that insure their continuance and responsibility. They have given their cooperating shareholders real and substantial service, have enabled them to reduce the fixed charges of doing business, have added to the margin of profit on goods sold, and in short have justified the faith of their founders by accomplishing exactly what they set out to do.

So well established as part and parcel of the retail drug business have some of these institutions become that no one is likely to challenge their right to existence as long as they deal justly with retailers who are non-stockholders, and with the other established branches of the legitimate drug trade, and provided also that they are true to label, and are not merely cooperative around the edges for the profit of a few thrifty individuals near the center of control.

Numerous others of these enterprises have been equally conspicuous as fail-

ures, either because their management was entrusted to the loudest talkers or most enthusiastic of their members, who endeavored to make noise and enthusiasm take the place of adequate capital and sound business judgment, or because of various other reasons that need not be mentioned.

As in gold mining and other hazardous enterprises, however, the many failures have been forgotten and only the few successes are remembered. The possibility of success in a properly conducted cooperative undertaking having been demonstrated, the movement in that direction has been greatly accelerated, and the rush of druggists to connect themselves with cooperative schemes of all kinds once more illustrates the common tendency of men to go in droves, and to do what other men are doing.

The doubting Thomases who refused to have anything to do with the original undertakings while they were in the experimental stage have swung from over-caution to over-confidence and are fairly falling over one another in their anxiety to connect themselves with anything that looks like a cooperative enterprise or that is labeled as such by its promoters.

Many of these are foredoomed to failure, and many of those which do not fail absolutely, to a precarious existence. They must glean in a field that has already been passed over by the earlier concerns, and in order to gain a foothold will need to put forth far greater efforts than were required of their predecessors.

Not only will their own success be problematical, but they will jeopardize the success of the existing concerns, for whether intended by their founders to be competitive or not, they must from force of circumstances become direct competitors of those already in the field, and to that extent diminish the opportunities for the successful continuance of the latter.

This is overdoing cooperation. It is traveling back over the road to the competition of individualism, to escape the evils of which the cooperative movement was inaugurated, for there is nothing to distinguish excessive competition between cooperative societies from excessive competition between partnerships, corporations or other kinds of commercial units.

Nor does it appear that this excessive multiplication of cooperative enterprises is at all necessary in order to serve the retailer in the way that cooperation is intended to serve him. The essential quality of true cooperation is not to earn excessive dividends on stock, but to secure reliable and economical service for the stockholder.

If it is necessary to become a stockholder in order to secure the service desired, the retailer can still procure stock in the established concerns, and even if required to pay a much higher price for it than when it was in the experimental stage the price, in most cases, will be no more than its original cost plus accumulated earnings, and hence the purchaser is getting all he pays for, without the risk which the original investor was required to assume.

Certainly it would be better, far better, to have a comparatively limited number of sound and conservatively managed concerns with widely distributed stock and ample surplus, and able to render certain and adequate service, than a multitude of small concerns of limited capital, giving slender and uncertain services and

of questionable responsibility, and liable by their failure to bring the entire co-operative movement into disrepute.

It is a problem well worth pondering over.

It is possibly an old fashioned and out-of-date theory, but until I learn of stronger reasons against it than any I have yet heard, I shall hold to the faith that the best cooperation, and that which will best serve the drug trade as a whole is that wherein the manufacturer, the jobber and the retailer, while co-operating within their respective classes for their own profit shall also cooperate honestly and heartily with each other for the welfare of all.

J. H. BEAL.

A CRITICISM OF AMERICAN MEDICAL EDUCATION.

SEVERAL years ago Abraham Flexner, working under the auspices of the Carnegie Institution, made a report upon the conditions prevailing in the medical schools of this country that proved to be a disagreeable surprise to those of us who had flattered ourselves that American medical educational methods were on a par with the best of European models.

In a recent number of the *Atlantic Monthly*, (Nov., 1913) he returns to the charge, and under the caption, "The German Side of Medical Education," makes a comparison of German and American medical schools that is far from flattering to the institutions of the Western Continent.

Of the German institutions he has little to say that is not complimentary, while of the American schools his remarks are almost wholly condemnatory, though here and there he admits that a few American institutions are not as bad as most of the others, and that in recent years there are some slight signs of improvement.

Speaking of the possibility of sampling the American system as a whole, he says:

"It is even a question whether such a hodgepodge as American medical education is really capable of being sampled or represented at all."

Referring to the fact that our students go to Germany and that German students do not come to us, and the reason for this one-sided movement we read that:

"Until, however, eager foreigners begin to flock to American schools for the purpose of continuing their studies, it is extremely likely that the one-sided movement of American students to Germany will be construed by laymen to mean that they find something there which is not found with equal ease and in equal abundance in the medical schools of their own land.

"To what is this superiority, if such it be, due? It is to be attributed in the first place to the fact that a wise and powerful government has drawn a sharp line below which no medical school can live."

Admitting that there are differences in quality among German institutions he comes perilously near to saying that even the worst of them are equal to our best, as for example:

"But for us the important point is that the differences never cut below a cer-

tain well-marked and lofty level. In respect to the educational qualifications of its students, in respect to the intelligence and capacity of its teachers, in respect to general laboratory and clinical facilities, every medical school in Germany surpasses and far surpasses, what any state in America lays down as the minimum requirement. There is, I repeat, no uniformity; but not in all Germany is there a feebly equipped or a feebly manned medical school, or a heterogeneous body of medical students. How high the minimum standard is in all these respects I will try to make clear by stating that on the minimum standard on which a medical school can live in Germany, over three-fourths of the medical schools of the United States and Canada would be at once stamped out of existence."

In speaking of American state supervision of medical education we are told that:

"The only American state which possesses a department of education somewhat resembling that of a German state is New York. The home of the Department of Education in Albany is rather more imposing than that of the Prussian Department of Education in Berlin; and the New York department also has large powers. The difference is that the Prussian department uses its powers and the New York Department, despite improvements in recent years, does not; in the city and state of New York, medical schools still exist which are utterly incapable of fulfilling respectably the purpose for which they purport to have been established; and schools in other states are recognized, despite equal or greater defects. That is to say, in the one American state in which an agency has been created for the maintenance of a decent minimum, the decent minimum is not yet maintained; still less so in other states."

Discussing the German student's liberty of choice of studies, or what we term the elective system, it is said that:

"A nation of educational 'spoon-feeders,' such as, alas, we in this country are, may well stand aghast at this free-and-easy treatment. I am myself inclined to think that the German arrangement is needlessly chaotic and wasteful; but I have no quarrel with the full responsibility which it throws upon the already well-disciplined medical student. The German instructor is not a probation officer dealing with children in their early twenties. He provides a rich and abundant fare. He could not provide this rich and abundant fare if his strength had to be exhausted in police duty, in quizzing, drilling, and marking. The two things of course hang together. Where there are well-trained students, there may in the years of maturity come full responsibility. If the student body were incompetent, the university professor would have to degenerate into a 'school marm,' as is frequently the case in our country."

How the American schools check the student's liberty of action at the wrong time, and also overload him with a burden of required subjects that he is unable to bear is set forth as follows:

"I am not concerned now to criticise these arrangements. I wish simply to draw attention to them by way of contrasting them with the martinet spirit which prevails the moment his liberal education is completed and the student begins to attack a subject in which he is really interested. That is the moment that we Americans select for tying him hand and foot: once he enters the medical school,

he is, for the most part, committed to a four years uniform grind, precisely as if it were known just what he ought to learn and as if the curriculum-makers knew it. The necessary subjects and parts of subjects are specified, as is the number of hours that he must devote to each. Routine is so exacting that the average medical student is not quite equal to it, and the better student is quite used up by it. Instead of furnishing opportunity and stimulus for development, the American medical school closes down upon the enterprising student, long inured to academic freedom, with an exhausting and depressing uniformity.

"This phenomenon is closely connected with another previously pointed out. Our laws—or their lax enforcement—permit the continued existence of weak medical schools. The public interest demands that their graduates be as well trained as possible. The states have endeavored, by precise specifications as to what the student must be taught, how and how long, to force inherently poor schools to be better than it is in their nature to be. Some poor schools have been thereby made so uncomfortable that they have desisted; a few have improved slightly; but the good schools have been harmed, and medicine and medical science have been deprived of initiative and originality. The Germans, surveying our situation, taunt us good-humoredly; they recall our pride in being a 'practical people.' 'Would not a truly practical people reach the end by forbidding the incompetent rather than by crippling the competent?' I have been frequently asked."

In discussing the hampering arrangements between hospitals and our medical colleges, and the alleged improvement in this respect in recent years we are told that:

"To no small extent, the improvement is as yet mainly on paper. More serious still, our clinical heads—mainly unproductive men—are far from hospitable to young workers. Where the chief is not himself a productive scientist, obvious considerations make it inexpedient for him to open the doors wide to ambitious and original advanced students.

"The truth is that the clinical teacher in the German sense hardly exists as yet in America at all. As contrasted with Germany, American teaching of medicine, surgery, and obstetrics, and so on, cannot properly be called professional teaching. Our professors of the clinical subjects, with exceptions so few as to be numerically negligible, are practitioners who make no effort to create the scientific or academic atmosphere and environment characteristic of the German clinic. The university spirit is missing in the clinical half of the American medical school. Let us not deceive ourselves on this score. We are paying the price of long-continued and still-continuing exploitation of clinical teaching."

In connection with the same subject, and illustrating the eagerness of medical practitioners for professorial dignities it is related that:

"An amusing example of total incapacity to appreciate the ridiculous has recently been furnished by a New York institution. In order to avoid being lowered in classification by the Council of Education of the American Medical Association, certain influential members of this medical faculty undertook to introduce certain improvements,—itself a situation which could not arise in Germany. The university authorities refused to carry out the bargain, whereupon the members in question resigned. Did this affect the school? Not a bit. The vacant

places were at once filled with practicing doctors. I venture to say that the incident could be repeated indefinitely, and the faculty kept full none the less.

Mr. Flexner accounts for the superiority of German methods of medical education as follows:

"The essential features which have contributed to the greatness of German medicine may then be concisely formulated as follows: First, the high minimum level of organization and equipment, below which the government will permit no medical school to live; second, the prolonged and serious secondary-school training which is absolutely, without exception, exacted of every student in the medical faculty; third, the freedom of the German university, which gives the professor the strength and leisure to work and encourages the capable student to do more than the minimum requirements of the curriculum for graduation; finally, the high respect in which the practising profession holds the teaching profession, and the custom of calling teachers freely from university to university."

If American medical education is ever to reach the level of the German standards we are told that:

"Those schools which cannot now meet them, or soon hope to meet them, ought not to be allowed to go on contributing their quota of immature and ill-trained practitioners to a medical profession whose general average is already probably below the lowest to be found in any other great modern nation."

It will be remembered that several years ago some rash individual proposed to the American Conference of Pharmaceutical Faculties that it should invite the Carnegie Institution to make an examination of the American schools and colleges of pharmacy. The invitation was not extended; but should such an examination ever be made—and should Mr. Flexner draw up the report—we may look for what the late Mr. Horace Greely would have termed "some mighty interesting reading."

J. H. BEAL.

PREPARING FOR THE SIXTY-SECOND MEETING.

PLANS have been pretty well decided upon now for the Detroit meeting of the American Pharmaceutical Association. The meeting will be held on the week beginning Monday, August 24. The Hotel Pontchartrain will be the headquarters. This hotel is admirably suited to the purpose.

It has a convention floor up at the top of the building, with eight or ten rooms of various sizes, thus being well adapted to an organization like the A. Ph. A., which is split up into so many sections and auxiliaries of one kind and another. Furthermore, the convention floor of the Pontchartrain is so high up that it is away from the dirt and noise of the street on the one hand, and on the other is subjected to the cooling breezes from the river.

The Detroit meeting, indeed, is going to be delightfully cool and pleasant. Detroit is not at all like the usual American city—hot and stuffy in the summer. It is located on the Great Lakes, gets the benefit of the water breezes, and is furthermore a city of great beauty and charm. Thousands of people go to Detroit annually to spend their summer vacations instead of frequenting the

customary resorts. It is a city that everybody wants to visit who hasn't already seen it, while the man who has seen it is not satisfied until he can return to it again.

Many delightful features are planned for the convention. There will, of course, be the customary reception and ball on Monday evening. On Wednesday, from 4 to 6, there will be a reception for the ladies. The afternoon and evening of Thursday will be devoted to a boat-ride tendered by Parke, Davis & Co., and many of the attractive spots will be viewed that have helped to make the environs of Detroit so noted. On Friday there will in all probability be an auto-

HOTEL PONTCHARTRAIN, DETROIT.
Official Headquarters of the 62d Convention.

mobile ride to the parks and to the famous shore drive around Lake St. Clair. Other contemplated entertainments are a smoker for the men, and either a theater party or a ride to Bois Blanc Island for the ladies. Of course smaller entertainments for the ladies will be sandwiched in all through the entire week.

Detroit has come to be a great manufacturing center—famous in three particulars. In the manufacture of drugs, stoves and automobiles Detroit unquestionably leads the world. It may be that some of those in attendance upon the convention will want to visit industrial plants in various lines. Thus, for instance, ten or fifteen people may want to go through the Ford or the Cadillac or the Packard automobile factory. Others may want to visit the Solvay Process

SCENE IN BELLE ISLE PARK, DETROIT.

DETROIT BOAT CLUB, BELLE ISLE PARK, DETROIT.

Works or any one of a hundred other interesting places in the city. It is expected that arrangements will be made for a number of small trips of this kind if sufficient interest is shown by the members. It is up to them. If you are interested please write now to the local secretary so that he may get an idea of what is wanted. Address your letter to Leonard A. Seltzer, 32 Adams West, Detroit, Mich.

It may be interesting to state, too, that certain reforms are going to be inaugurated at the Detroit meeting in the conduct of the convention business. All the sessions will be held in the day time, and the evenings will be left free for rest, recreation and enjoyment. The Council, only, will meet at that time, and this will give a chance for the Sections to begin their work in the morning promptly at 9:30. Mr. Seltzer, the local secretary, is working out a plan of bulletin-boards so that a member who is sitting in one Section may know what is going on in others at the same time, thus making for a maximum of interest. Promptness will be exercised all along the line, and there is every expectation that the Detroit meeting will be a hummer!

THE A. PH. A. BUTTON.

AT the Nashville meeting, the production of a distinctive American Pharmaceutical Association button was authorized. The design selected is a gilt edged button having a shield in blue enamel edged with gold on a white field with gilt letters A. Ph. A. in English text across the shield.

This button should be worn by all members of the Association and will serve as an introduction to fellow-members. It should become the insigne of the professional standing of pharmacists.

The buttons made in double gold plate with rolled gold shoe and hard enamel will be supplied to members at 25c apiece. A limited number of 8 carat gold buttons have been ordered and these will cost the members \$1.00 apiece.

Every member should promptly order one of these buttons and wear it on every convenient occasion. Specify whether you want the backing to be the regular screw or a jewellers catch pin. Send all orders to

COMPARATIVE ACTIVITY OF VARIOUS SPECIES AND VARIETIES OF DIGITALIS.

F. A. MILLER, M. S. AND W. F. BAKER, B. S., M. D.

But few of the many species and varieties of the genus *Digitalis* have been examined for comparative toxicity, Paschkis (1) claims that *Digitalis ambigua* contains the same constituents as *Digitalis purpurea* and that the medicinal properties of the two are the same. Goldenberg (2) concludes that all species exert the same action on the heart of a frog as the infusion of *Digitalis purpurea*, but differ considerably in the energy of their action. He says that *Digitalis eriostachys* and *Digitalis glandulosa* are only slightly active and that *Digitalis fontanesii* is extremely feeble. *Digitalis nervosa* he finds to be 1.5 times and *Digitalis ferruginea* even 10 times more active than *purpurea*. This is indeed a small number of species upon which to formulate conclusions for a genus consisting of twenty-three or more species and numerous varieties. Boudgest (3) has examined *Digitalis grandiflora* which is synonymous with *Digitalis ambigua* and says that it possesses activity as a cardiac remedy which is fully equal to that of *Digitalis purpurea*.

This leaves a large number of species and horticultural varieties which have not been investigated for comparative medicinal value. For this reason as well as to gain more information upon the effects of cultivation, soils, geographical distribution and time of collection it was thought desirable to examine samples of as many species and varieties as could be obtained. Only samples from plants grown under uniform conditions and from seed of known source were used in the experiment. Catalogues from the most prominent seedsmen and nurserymen of the United States, England, Germany, and Japan were examined and all the species and varieties listed by them were obtained for planting. The first of these plantings were made as early as December, 1911, and the others extended through January, February, March, and April of 1912.

All seed were germinated in the greenhouse in seed pans filled with sterile soil. Other precautions were taken to guard against accidental mixture of seed. The small seedlings were transplanted to flats as soon as the second leaves had made their appearance. They were retained in the greenhouse in these plant flats until weather conditions would permit of their being transferred to cold-frames. Transplanting from the cold-frames to the open field commenced May 10th and continued without interruption until all plants were transferred. All varieties were grown in the same field upon a uniform soil consisting of clay loam. Cultivation was thorough, frequent, and continued throughout the growing season.

With few exceptions the various forms were grown in uniform plots of one fortieth acre, requiring two hundred and sixty-four plants each. Leaves for the purpose of testing were collected seven months from the date of seed germination. The last collections were made September 19th. With two exceptions all samples were collected from non-flowering plants. The samples consisted of all the leaves from ten representative plants of each plot. These were dried either at room temperature or in a hot air oven at one hundred degrees centigrade. They were immediately reduced to a number sixty powder and sealed in amber bottles until tested. The following table gives the species or variety, source of seed, date of germination, manner of curing, and effective dose as obtained by the frog-heart method of Cushny.

The foregoing table shows a variation of 84 percent in the effective dose as determined for the thirty-one samples. With few exceptions closely related forms show little uniformity in toxicity. The varieties which have originated from the species purpurea (Numbers 1 to 19) show a variation of over 75 percent. Contrary to all expectations the highest value was obtained from lanata, a species, quite distinct from purpurea. Gloxinia flora alba a purpurea strain gave the lowest value. Eighty-three percent of the total number of samples tested indicate a greater toxicity than the official purpurea. Compared with average digitalis leaf, 55 percent of this number exceed the commercial article as indicated by the effective dose.

With two exceptions all samples were collected from non-flowering plants. These exceptions were the synonymous forms, ambigua and macranthus, from which it was possible to collect samples from both the flowering and non-flowering plants. Macranthus shows a greater toxicity in the flowering stage while ambigua shows practically the same value for both the flowering and non-flowering plants. It is of interest to note that the species purpurea from England, Ore-

gon, and Japan have the same indicated value. The Japanese form which was supplied as *Digitalis* sp. proved upon flowering, to be one of the purest forms of *Digitalis purpurea* under investigation.

In this respect there is much uncertainty as to the nomenclature of the *purpurea* group and many of the varieties now recorded will doubtless be reduced to synonymy. Many of these varieties consist of a conglomeration of types which must be isolated and cultivated as pure strains before they will possess further value for experimental purposes.

The narrow leafed forms, represented by such species as *canariensis ambigua*, *lutea*, and *lanata* have been found true to name and reproduce themselves in pure stand. Synonymy also exists in this group but the classification will be easier than in the broad leafed forms. A thorough systematic investigation of the whole genus will be necessary before further work can be done upon the comparative medicinal value of the various species and varieties.

In conclusion it may be pointed out that accurate botanical investigations should precede or accompany any comparative investigations of this group of plants; that the results indicate that good digitalis leaf may be obtained from the first year flowerless plants; that cultivation in itself does not lessen toxicity and, that valuable forms other than *purpurea* may be found among the many species and horticultural varieties not hitherto investigated.

INFLUENCE OF HEAT AND METHOD OF STORING UPON THE POTENCY OF DIGITALIS LEAVES.

CHAS. C. HASKELL AND F. A. MILLER.

Two points of much interest to the pharmacist and to the physician are the most desirable methods of curing and preserving digitalis leaves.

It is important to know whether the use of a moderately high degree of temperature is permissible, because, if such be the case, rapid drying can be accomplished and the theoretical, injurious enzyme destroyed and dependence upon favorable atmospheric conditions can thus be obviated.

Hart³ finds that subjecting the leaves to an "excessive temperature" caused a loss in activity of 25 percent. Unfortunately, he does not state what this temperature was. Hale², using dried leaves (moisture content of about 10 percent), concluded that the strength of the leaves, as determined by Cushny's method, is unaffected by a temperature up to 120° C., but that a temperature of 140° C. for two hours has an injurious action.

Our experiments were carried out upon leaves from conservatory grown plants of *Digitalis gloxiniaeflora*. These plants were eight months old when tested, and in some instances a sufficient supply of leaves was secured from each plant to

enable us to carry out all comparative tests on a single plant, thus eliminating the possibility of variation due to individual plant differences.

The leaves, after drying were reduced to No. 60 powder and tinctures were made, using 75 percent alcohol as a menstruum. These tinctures were tested by Cushny's frog method and in a few cases the lethal dose for guinea pigs also was determined. In testing upon guinea pigs, the alcohol was not removed.

EXPERIMENT I.

Digitalis Gloxiniaeflora, Single Plant.

No.	Dried at	Frog Assay.	Guinea Pig Assay.
B-1115	120° C. 4 hours	0.0055	0.002 0.0025
B-1116	50° C. 24 hours	0.0055	0.0030
B-1117	35° C. 5 days		
	40° C. 3 hours	0.0050	0.025

EXPERIMENT II.

Digitalis Gloxiniaeflora, Single Plant.

No.	Dried at	Frog Assay.
B-1124	120° C. 12 hours	0.0065
B-1128	80° C. 5 hours	0.0065

The frog heart assays of these samples give values near those secured with similar samples of *Digitalis purpurea*. The extremely high toxicity for guinea pigs is explainable by the menstruum used. It has been our experience that an alcoholic menstruum of 75 percent enables the percolation of a tincture much more toxic for guinea pigs but not much stronger on frogs than one made with 50 percent alcohol.

From these experiments, it seems safe to conclude that a temperature of 120° C. applied to green leaves causes no greater loss in toxicity or ability to influence the frog's heart than does a temperature of 40° C.

There is apparently little agreement as to the keeping qualities of dried digitalis leaves exposed to the air. Focke¹ claims that one month is sufficient time for a considerable loss in strength to occur when the leaves are exposed to the air and contain more than 1.5 percent moisture. Pratt⁵ reaches somewhat similar conclusions. Hale² on the contrary, finds that leaves containing from 5.8 to 9.4 percent moisture are very active at the expiration of one, two, three and eight years, respectively. Hatcher and Eggleston⁴, also, have been unable to see that digitalis leaves from three to five years old are any less potent than fresh samples.

Our own experiments bearing on this point have extended over only one year, but it seems that the additional evidence they present justifies their being reported.

The remainder of sample B-1124, which had been dried at 120° C. for twelve hours and gave a frog value of 0.0065 was divided into two portions, B-1129 and B-1130. These two portions were placed in wide-mouthed amber bottles, one being carefully stoppered and sealed with paraffin, while the other was closed with a loosely-fitting plug of absorbent cotton.

EXPERIMENT III.

Digitalis Gloxiniaeflora, Single Plant.

No.	Method of Storage.	Original Assay.	Assay 12 Months		Moisture.
			Later.		
B-1129	Open Bottle	0.0065	0.006		5.43
B-1130	Sealed Bottle	0.0065	0.006		2.31

The remainder of sample B-1128, dried at 80° C. for five hours, which originally tested 0.0065, was divided into two portions, B-1131 and B-1132, and stored in a manner similar to that described above.

EXPERIMENT IV.

Digitalis Gloxiniaeflora, Single Plant.

No.	Manner of Storage.	Original Assay.	Assay 12 Months		Moisture Content.
			Later.		
B-1131	Open Bottle	0.0065	0.0055		6.04
B-1132	Sealed Bottle	0.0065	0.0060		2.83

A third sample was secured by collecting leaves from several different plants of *Digitalis gloxiniaeflora*. These leaves were dried at 30° to 55° C. for twenty hours; reduced to a No. 60 powder and gave a value of 0.006. Two lots were stored as in the preceding experiments.

EXPERIMENT V.

Digitalis Gloxiniaeflora, Several Plants.

No.	Manner of Storage.	Original Assay.	Assay 12 Months		Moisture Content.
			Later.		
B-1134	Open Bottle	0.006	0.006		5.92
B-1133	Sealed Bottle	0.006	0.006		4.76

From these experiments, it is safe to conclude that in one year no deterioration occurred in our samples of leaf, irrespective of the manner of storage, even when the moisture content was as great as 6.04 percent.

In some instances, a higher value is secured on the second assay than was obtained on the fresh leaf. This is to be explained by the limits of experimental error inherent in the assay method, as in all except one case, this difference does not amount to 10 percent.

INFLUENCE OF SOIL COMPOSITION ON MEDICINAL PLANTS.

F. A. MILLER, M. S.

Observations upon the influence of soil composition on medicinal plants have been made by several investigators. These observations have indicated that certain variations may occur in the percentage of active principles when the growing plants are subject to different soil conditions. Agriculturists have long recognized the influence of soil composition upon crop production. Their methods of measuring this influence, however, have differed from those employed with medicinal plants. Results have usually been determined by amount of total crop produced and not by chemical and biological assay. Recently some work has been done upon the chemical determination of certain constituents such as oil,

sugar, and protein, as a means of following this influence. A combination of these methods would be essential to the best results with medicinal plants.

Hooper (1) demonstrated this fact by his work upon Jalap. He found that by using superphosphate at the rate of 1600 pounds per acre, he could bring about an increase in the dry weight of tubers produced as well as an increase in the percentage of resin. While the increase in resin by this treatment was only 24 percent the increase in dry weight was 86 percent. Other investigators have given more attention to percentage of active principles than to crop production.

Carr (2) contends that although the addition of manure to a soil already suited to the growth of belladonna is no disadvantage and may be slightly beneficial, yet where large quantities of nitrogenous fertilizers are employed somewhat lower percentages of alkaloid are observed. This condition he attributes to the larger growth which results from such manuring. The author does not summarize his results with farmyard manure, nitrate, calcium cyanamide, basic slag, superphosphate, and potash. He concludes, however, by saying that in whatever latitude belladonna is grown, it will doubtless be found that the composition of the soil, the use of fertilizers, and seasonal conditions make for small variations. During the four years that he continued his experiment the results were not taken uniformly according to the fertilizers used.

Ransom and Henderson (3) have studied the effect of kainit, superphosphate, sodium nitrate, potato mixture, basic slag, and combinations of these upon yield of green weight and percentage of total alkaloids in belladonna. In their conclusions they state that although they have not obtained sufficient evidence that the percentage of alkaloid in the dried leaf is materially altered by artificial manures, it would appear that in several cases the yield of green plant per acre has been largely increased. They further state that it would also appear that in the case of belladonna it is useless to hope that the drug shall possess anything approaching uniformity in medicinal potency, even when carefully collected and dried. It would seem that we are entirely too young in this work to make predictions of what the future may or may not disclose. The possibilities of obtaining uniformity in cultivated belladonna have hardly been touched upon and will not be known until the numerous problems of propagation and breeding have been thoroughly investigated. No efforts worthy of mention have as yet been made to produce a strain or variety of belladonna which will exhibit a uniform yield of alkaloids.

Chevalier (4) records data indicating an increase of nearly 60 percent of total alkaloids in belladonna when treated with nitrogenous fertilizer in combination with manure. Acid phosphate and potash produced no increase.

Tschirch (5) makes the broad, general statement that an increase in the amount of valuable constituents has been affected in the case of almost all cultivated plants.

To gain more information upon the influence of soil composition upon medicinal plants, experiments have been performed, using digitalis, stramonium, and belladonna. These experiments have been performed both in the open field and in the greenhouse with various commercial fertilizers and soils of different mechanical mixture. Precautions have been taken to secure uniform conditions in selecting locations of plots and in the collection and curing of samples.

Digitalis. The plants for this experiment were grown from seed obtained in Oregon from wild plants. They were germinated December 8th, 1911, in the greenhouse, transplanted to flats and retained in the greenhouse until March 19th, 1912, when they were transferred to cold frames of double glass construction. Strong, hardy plants were thus obtained, eight hundred and seventy-five of which were used in the experiment. These were transplanted to the open field May 10th, 1912. Clean cultivation was practised throughout the summer. The plot was located in an apple orchard between two rows of trees upon a soil which had been cropped to potatoes for several consecutive years without fertilization. The plot was divided into six equal parts and the fertilizers applied at the rate of six hundred pounds per acre. The nitrate of soda was divided into three equal portions and applied at intervals of two weeks. The fertilizers were not applied until the plants were well established. They were then distributed by hand as uniformly as possible about the plants of each plot and immediately worked into the soil by cultivation. Mixed samples were collected for assay in early September, 1912, and cured at 100° centigrade. The following table gives the fertilizers used and the comparative results as obtained by the one hour frog heart method for assaying digitalis leaf.

Plot No.	Sample No.	Fertilizer Used.	Assay.
1.....	B-1232	Nitrate of Soda.....	0.0065
2.....	B-1233	Sulphate of Potash.....	0.0062
3.....	B-1234	Normal Fertilizer.....	0.0060
4.....	B-1235	Acid Phosphate.....	0.0062
5.....	B-1236	Nitrate of soda, Sulphate of potash (equal parts).....	0.0060
6.....	B-1237	Control	0.0062

Little or no effect can be attributed to the use of these commercial fertilizers upon digitalis. This is evident from the fact that the difference in the comparative value of the samples from the different plots as indicated by the above figures is less than the possible experimental error.

Stramonium. The effects of a normal fertilizer upon the percentage of total alkaloids in stramonium when applied at the rate of 600 pounds per acre have been previously noted (6). The average results obtained are repeated below.

DATURA STRAMONIUM.

No Fertilizer.	Fertilizer.	No Fertilizer.	Fertilizer.
0.50%	0.61%	0.60%	0.64%

DATURA TATULA.

No Fertilizer.	Fertilizer.	No Fertilizer.	Fertilizer.
0.49	0.54	0.62	0.68

Belladonna. It is not only desirable to know the effects of commercial fertilizers upon medicinal plants but also the effects of various types and mixtures of soils. Only in this manner can the growth requirements of these plants be determined and their cultivation intelligently recommended. An open field experiment was performed upon first year belladonna plants using sodium nitrate, potassium sulphate, acid phosphate, and a normal fertilizer. The plants were started in the greenhouse March 8, 1912, from seed taken from a commercial shipment of crude belladonna leaves, assaying 0.62 percent total alkaloids. All

fertilizers were applied July 15, when the plants had reached a height of from twelve to twenty inches. They were applied by hand as uniformly as possible and immediately worked into the soil by cultivation. The total amount of sodium nitrate used was divided into three equal portions and applied at intervals of two weeks. All the fertilizers used were applied at the rate of six hundred pounds per acre. No commercial fertilizer other than stable manure had been used upon these plots for a period of at least twelve years. The samples for assay were collected September 19, 1912, from representative plants of each plot. The following results were obtained:

FIRST EXPERIMENT.

Plot No.	Sample No.	Fertilizer Used.	ASSAY.	
			Leaves.	Root.
1.....	B-1258	Sodium Nitrate.....	0.699%	0.510%
2.....	B-1259	Potassium Sulphate.....	0.858%	0.504%
3.....	B-1261	Acid Phosphate.....	0.911%	0.380%
4.....	B-1260	Normal Fertilizer.....	0.835%	0.575%
5.....	B-1262	Control	0.688%	0.420%

The results of the first experiment indicate that marked changes may be produced in the percentage of alkaloids through the application of certain commercial fertilizers. However, sufficient data have not been obtained to justify any statement concerning the regularity of these changes. It is not known whether the changes indicated are due to the direct or indirect action of the fertilizers and what their influence would be when applied to different types of soils, under varied climatic and meteorological conditions. The extent of the error as introduced by individual plant variation in an experiment of this kind is also not known but must be considerable. Ten individual plants from this plot showed a variation of 50 percent. True (7) in examining individual plants has found this variation to be as much as 70 percent.

Disregarding this possible source of error, the increase in percentage of total alkaloids in the leaf as indicated by these trials is 20 percent for potassium sulphate, 24 percent for acid phosphate, and 18 percent for the normal fertilizer, the sodium nitrate causing no change. The increase in the root is 18 percent for sodium nitrate, 17 percent for potassium sulphate, 27 percent for the normal and a decrease of 9 percent for acid phosphate.

To further test the effect of sodium nitrate and acid phosphate upon percentage of alkaloids another experiment has been performed upon second-year plants. It was hoped in this experiment to eliminate the factor of individual plant variation in percentage of alkaloids. To accomplish this, fifteen uniform plants were selected and marked with conspicuous tags. These were divided into three groups of five plants each, leaving considerable space between each of the three groups. All weeds were removed from around these plants and the soil thoroughly cultivated and pulverized. Before applying any fertilizer, samples were collected from the three groups of plants. In collecting these samples care was taken to obtain an equal number of leaves from each plant of a given group, and that these leaves should be of uniform size. This same procedure was followed in collecting the samples after the fertilizers had been applied. In this manner and by the utilization of the same plants throughout the

experiment it is believed that the individual characteristics of the plants have been obviated and that the results should be more accurate than where no attention is given to the proportion of samples from different plants or to the utilization of identical plants throughout the experiment. After the original samples were collected plots number 1 and 2 were given a liberal application of sodium nitrate and acid phosphate, respectively. Plot number 3 received no fertilizer. After an interval of two weeks plots 1 and 2 were given a second application. At the end of another two weeks period samples were collected for assay in the manner designated. At this time the fifteen plants were removed from the soil and the principle roots from all plants of each group were taken for assay. At the beginning of the experiment a root sample was taken from three plants which were growing near the control group. Rain occurred after both applications of fertilizers thus insuring immediate availability.

SECOND EXPERIMENT.

Samples collected before applying fertilizers.

Plot No.	Sample No.	Fertilizer Used.	Assay Leaf.	Assay Root.
1.....	B-1624	Potassium Nitrate.....	0.558%	
2.....	B-1625	Acid Phosphate.....	0.569%	
3.....	B-1626	Control	0.598%	
	B-1627	Control, 3 plants.....		0.385%

Samples collected after applying fertilizer.

Plot No.	Sample No.	Fertilizer Used.	Assay Leaf.	Percentage Increase in Leaf.	Assay Root.
1.....	B-1712	Potassium Nitrate.....	0.724%	23%	0.345%
2.....	B-1713	Acid Phosphate.....	0.742%	23%	0.345%
3.....	B-1714	Control	0.724%	18%	0.322%

The results indicate a considerable increase in the percentage of alkaloids in the leaf samples from all plots. The percentage increase in the fertilized plots is but little greater than that in the control. Practically no change is indicated in the alkaloidal content of the root samples.

The third experiment upon belladonna was carried on in the greenhouse with soils of widely different types. The plants used in the experiment were obtained by vegetative propagation from individuals of known alkaloidal yield. These individual plants were field grown and were selected at random. Cuttings were made from them and placed in a propagating bed filled with sand. As soon as strong roots were developed the plants were potted in two-inch pots, using a loam soil. They were later transferred to four-inch pots. December 16, 1912, they were removed from these and after all soil was carefully washed from the roots they were placed in six-inch pots which had previously been filled with the different types of soils. In addition to the potted plants, ten were grown on a greenhouse bench, filled with rich fibrous loam.

All the plants made very poor growth during the winter, due to the low temperature of the greenhouse which was essential to the success of propagating work, being done at that time. The experiment was brought to a close September 7, 1913, and on account of their small size it was necessary to use the entire plants for assaying. The proportions of root to stem and leaves were about the same in all cases. On account of the presence of roots in the assay samples the

results would be expected to run lower than those of the original plants. The soils used in the experiment were as follows:

- No. 1. From field in which original plants were grown.
- No. 2. Equal parts clay and No. 1.
- No. 3. Equal parts clay and sand.
- No. 4. Equal parts clay and leaf mould.
- No. 5. Leaf mould.

The clay was obtained from an excavation eight feet below the top soil. Sand was used in number 3 to improve the physical condition of the clay. The leaf mould consisted of well decayed vegetable substance obtained from a woodlot of mixed growth.

The following table gives the number of the original plants from which the vegetative cuttings were made, soil and sample numbers, percentage of total alkaloids as determined upon leaf samples from the original field grown plants. All numbers of the same denomination in the first column refer to the same original plants from which the cuttings were made. A complete series from each of these original plants was started in the different soils but many of them were lost before the completion of the experiment.

The results indicate a considerable decrease in percentage of alkaloids in all plants examined, regardless of soil treatment. Even when grown upon the same soil as the original plant the decrease has been as great as from 20 percent in

THIRD EXPERIMENT.

Number.	Soil Number.	Sample Number.	Assay.	Assay, Original Plant.
10	1	B-1664	0.351%	0.820%
10	2	B-1665	0.373%	0.820%
10	4	B-1666	0.364%	0.820%
13	3	B-1667	0.351%	0.870%
13	4	B-1668	0.382%	0.870%
13	5	B-1669	0.323%	0.870%
13	Bench	B-1670	0.498%	0.870%
13	Bench	B-1671	0.396%	0.870%
13	Bench	B-1672	0.477%	0.870%
14	1	B-1673	0.441%	0.664%
14	2	B-1674	0.365%	0.664%

15	1	B-1677	0.283%	0.600%
15	Bench	B-1678	0.471%	0.600%
15	Bench	B-1679	0.501%	0.600%
15	Bench	B-1680	0.442%	0.600%
16	1	B-1681	0.412%	0.516%
16	Bench	B-1682	0.398%	0.516%
16	Bench	B-1683	0.436%	0.516%
17	1	B-1684	0.454%	0.616%
17	2	B-1685	0.404%	0.616%
17	3	B-1686	0.370%	0.616%
17	4	B-1687	0.412%	0.616%
17	Bench	B-1688	0.373%	0.616%

number 16, to 57 percent in number 10. Where two or more plants from the same individual parent were grown in the uniform soil on the greenhouse bench a variation is noted of from 9 percent in number 16, which is only slightly greater than the experimental error, to 20 percent in number 13. On the other hand, such widely different soils as number 1 and 4 produced a difference in alkaloidal

yield of only 4 percent in plants from number 10, and 9 percent in those from number 17, and 8 percent on soils 3 and 5 in plants from number 13. After allowing 5 percent for experimental error there is little difference in favor of soil influence in the foregoing instances. The results as a whole indicate that further work is necessary on the influence of soil composition upon medicinal plants, before any generalizations can be made. The second experiment indicates that seasonal variations in alkaloidal percentage may have to be investigated more thoroughly. In this instance the percentage of alkaloids in the control plants increased nearly as much as in the fertilized plants. Also the influence of the two fertilizers, though apparently slight, seem to be identical with reference to the percentage of alkaloids. It is believed that there have been considerable sources of error in most of the work upon soils and fertilizers. It is desirable in this respect to first locate these sources of error and then attempt to eliminate them before proceeding further upon the problems of soil composition.

FURTHER STUDY OF THE ALKALOID GELSEMININE.

L. E. SAYRE.

In previous papers read before this Section by the writer on the alkaloids of Gelsemium, it will be seen that there has been a progressive study of the uncrystallizable alkaloid, named by Thompson, Gelseminine.

The attempt has been to bring this alkaloid into such a state of purity that it will be available for making an ultimate chemical analysis.

The present year's work has been that resulting from an investigation of the alkaloids from 50 pounds of the crude drug. From this 50 pounds, there was obtained in an unpurified condition 21.5 gms. of Gelsemic acid, 75.7 gms. of crude Gelsemine and 36.4 gms. of crude Gelseminine, making in all 112.1 gms. of crude alkaloids and 21.5 gms. of crude Gelsemic Acid.

The effort in the present year's investigation was to purify the gelseminine for physiological testing and for the comparison with the alkaloid gelsemine. It should be stated in passing that hitherto we have found it very difficult to rid gelseminine absolutely from the contaminating impurity, gelsemine. We have found the separation of the two alkaloids to be made more complete by treating the crude gelseminine hydrochlorid first with alcohol which separates out most of the gelsemine hydrochlorid. The alcoholic extractive resulting from the evaporation of the alcoholic filtrate is now re-dissolved in acetone and a further separation of gelsemine hydrochlorid is possible.

By treating the extract resulting from the evaporation of the acetone solution of gelseminine hydrochlorid with water and precipitating the solution

with a slight excess of ammonium hydroxide, the precipitate, after washing, is dissolved in diluted sulphuric acid, and re-precipitated with ammonium hydroxide and the resulting precipitate washed until free from sulphates. This precipitate, when dried in a desiccator was a light brown powder apparently free from resinous and gummy material. This was the product mentioned in the physiological experiments in the following paper.

Since Dr. Chillingworth's experiments, we have been able to further purify gelseminine and we have separated this substance into two parts,—one more highly colored and weaker, the other very much lighter and stronger in physiological action.

During the next year, we shall continue this investigation and have strong hopes of bringing the so-called gelseminine into such a state of purity that it may be analyzed for its elementary chemical constituents.

The gelsemine used by Dr. Chillingworth was a purified product resulting from the purification of the alkaloid obtained from this year's lot of drug. It was perfectly white, and apparently free from any of the uncrystallizable coloring matters or uncrystallizable alkaloids.

PHYSIOLOGICAL STUDY OF GELSEMINE AND GELSEMININE.

F. P. CHILLINGSWORTH, M. D., PHARMACOLOGIST, UNIVERSITY OF KANSAS.

In this paper I will adhere strictly to the physiological action of the alkaloids of gelsemium. For the chemistry and preparation of these active principles consult F. A. Thompson,¹ L. E. Sayre,² E. D. Reed,³ Kimberly, Robertson and Vanderkleed,⁴ and L. E. Sayre.⁵

We will first take up the physiological actions of gelsemine and gelseminine in detail and later will draw our conclusions.

Throughout these experiments two standard solutions were used (one of the active principle gelsemine and the other of the active principle gelseminine) so made that one cubic centimeter of the solution equalled .001 gram of the alkaloid.

Our results though not extensive enough to serve as a basis for far reaching conclusions, nevertheless are of enough importance perhaps to add to the observations of others, and we hope suggest certain lines of experimentation which might be followed up to good advantage.

The two standard solutions referred to above were prepared for us by Prof. L. E. Sayre, Dean of the School of Pharmacy at the University of Kansas. This being the first time that the two alkaloids of Gelsemium have been successfully isolated in the pure state.

The literature on the action of these alkaloids is very confusing and unsatisfactory. Prof. C. Binz, of Bonn, is by far the clearest on this subject and we cannot do better than to quote in brief: "Gelsemium paralyzes the motor centers of the brain as well as the respiratory center in the medulla oblongata. Sen-

¹Thompson, F. A.: *Phar. Era*, 1887, page 2.

⁵*Jour. A. Ph. A.*, 1912, May.

EXPERIMENT NO. 1.

sibility remains intact, and the irritability of the muscles and the motor nerves is retained. Death is produced by paralysis of respiration." Bartholow states that, "Gelsemium dilates the pupils owing to paralysis of the circular fibers."

Recently Prof. Sayre contends that the actions of these two alkaloids are not the same and that the action of one often masks the action of the other.

Experiment No. 1. Frog—weight 35 grams. Showing the true action of the alkaloid gelsemine upon the frog's heart.

Time	Rate	Remarks
3.34	60	Normal.
3.40	60	One drop of gelsemine applied to the heart.
3.43	52	Gradual slowing with increasing diastole, systole still complete.
3.47	50	No marked change.
3.55	46	Heart continues to slow.
3.57	44	Second drop of gelsemine applied.
4.00	36	Here is best seen the action of this alkaloid.
4.06	30	Slowing most marked at this time, systole less complete—diastole prolonged.
4.15	36	Beginning recovery of tone of heart. Rate picking up.
4.30	46	Shows continued recovery of heart from gelsemine.

This experiment shows the typical action of gelsemine, it also shows that its action is not as intense as that of gelseminine—in other words the alkaloid is not as powerful. It is to be noted that here we employed two (2) drops of the preparation to get definite results. Also the absolute recovery of the heart (in about twenty-five minutes suggests that the action is not lasting.

Experiment No. 2. Frog—weight 37 grams. Showing the true action of the alkaloid gelseminine upon the frog's heart.

Time	Rate	Remarks
2.20	65	Normal.
2.24	60	One drop of gelseminine applied to the heart, note immediate slowing.
2.27	54	Slowing more marked.
2.31	50	Systole failing, diastole more marked.
2.35	48	
2.40	40	Tendency to stay in diastole.
2.45	28	Here we find the heart dropping a beat. Rate and output much decreased.
2.47	24	
2.52	20	
2.54	18	Typical gelseminine action.
2.59	14	Characteristic pauses between systole.

This experiment shows the intense action of the alkaloid gelseminine upon the heart. However it must be borne in mind that this action is via the central nervous system and not as might be first supposed to direct action upon the cardiac muscle.

This primary action upon the nervous tissues we will discuss later on.

Experiment No. 3. Turtle (medium.) Showing typical gelseminine action upon the heart.

Time	Rate	Remarks
10.55	60	Normal.
10.57	..	One drop of gelseminine applied to the heart.
10.59	50	Slowing of ten beats per minute obtained in two minutes.
11.00	50	
11.04	28	Marked slowing: Systole very imperfect, diastole slightly prolonged.
11.06	25	See above.
11.10	20	Rapid failure of heart in all its phases.
11.14	20	
11.18	00	Heart stopped in diastole.

This record is of especial interest in that it is a well known fact that the

heart of a turtle will stand violent abuse—in fact Howell states that after complete stoppage of the heart by electrical stimulation it can be made to resume beating and will recover at the end of four hours.

One drop of gelseminine as is shown in this experiment will completely stop the heart of the turtle in exactly twenty-three minutes, thus showing the marked strength of this alkaloid.

Experiment No. 4. Frog—weight 31 grams. Showing the action of the alkaloid gelsemine on the living frog.

Time	Remarks
3.35	Injected fifteen drops of gelsemine solution into dorsal lymph sac.
3.37	Movements retarded slightly.
3.38	Stimulation required to produce movements.
3.40	Can still retract both legs.
3.42	Cannot swim.
3.43	Respiration is rapid: seems to retain air in lungs.
3.45	Foam at mouth: respirations sixty per minute.
3.46	Reflexes still O. K.
3.48	Same condition.
3.52	Respiration is slower and irregular: hard to count.
3.55	Same condition.
3.58	Abdomen opened: stomach distended with air.

Here we see for the first time the toxic action of gelsemine, caused by the large injection (15 min.) of this alkaloid. In this experiment the heart rate was sixty beats at the end of the experiment, showing that even in toxic doses, the heart of the frog is not affected by gelsemine. Furthermore the sole site of action was centered upon the respiration through the respiratory center of the medulla. This experiment suggests that this solution must be applied direct to the heart in order to produce slowing.

Experiment No. 5. Frog—weight 36 grams. Showing the action of the alkaloid gelseminine on the living frog.

Time	Remarks
2.22	Injected seven drops of gelseminine solution into dorsal lymph sac.
2.23	Movements retarded at once.
2.24	Same.
2.25	Cannot retract the legs.
2.30	Cannot swim.
2.31	Respiration upset: rapid and very irregular: retains air in the lungs and stomach.
2.32	No attempt to recover when placed on back. All power of motion lost.
2.33	Fibillary twitchings.
2.35	Swallows often when trying to breathe.
2.37	Abdomen opened: frog died at 2:36: stomach distended with gas(due to swallowing movements).
	Abdominal organs greatly congested. Heart stopped in extreme diastole.

The full meaning of this experiment is best obtained by comparing it with Exp. No. 4. Noting that only one half as much alkaloid was used and that at the end of the experiment the frog was dead, also note the condition of the heart and the early loss of the reflexes.

It will be seen then that here we get marked depression from the start and that again the site of action is upon the respiratory center. We must also observe the muscular twitchings caused by this toxic dose of the alkaloid gelseminine.

Experiment No. 6. Dog—weight 15.5 K. Showing the effect of gelseminine upon blood pressure. A. C. E. mixture used.

The carotid artery was dissected out and connected by means of a glass cannula to an upright glass tube. This cannula had previously been filled with a saturated solution of magnesium sulphate to prevent clotting. The column of blood was next allowed to remain stationary in the tube for five minutes at the end of which time five (5) drops of the gelseminine solution was injected into the jugular vein. Three (3) minutes later we observed a direct fall in blood pressure amounting to fifty (50) mm. of Hg.

EXPERIMENT No. 3.

Ten minutes later a second injection of five (5) drops was given and we again obtained a drop in blood pressure of twenty (20) mm. of Hg. It will be noted that this dog was not given the customary dose of morphine in order that this factor should not enter into our conclusions.

In Experiment 7 a second dog was used as above but we replaced the gelseminine with gelsemine, using twice the dose used in Exp. No. 6. After the total injection of twenty (20) drops of the gelsemine solution we noted a fall in blood pressure amounting to but 12 mm. of Hg. Here again we see the difference in action.

In results of this nature this question naturally presents itself—where is the action located? Is it in the muscle itself or is it in the central nervous system.

We believe we have answered this question in the following experiment. A frog was pithed in the usual way and next the thigh muscles of one leg were ligated, care being taken to leave the great sciatic nerve free.

The alkaloid was now injected as before into the dorsal lymph sac and the results carefully noted. After a short period of quiescence, sudden fibrillations were noted in both legs. This fact, supported by the fact that in all our experiments the respiration failed long before the heart beat, confirms in a way the earlier investigators, and tends to show that the action of these two alkaloids is primarily upon the central nervous system. The action on the heart and blood pressure we likewise explain through the inhibitory influence carried by the vagi. The dilatation of the eye we attribute to the nervous relaxation of the circular fibers.

CONCLUSIONS.

1. From the evidence at hand it is evident that the action of these alkaloids is upon the central nervous system, and that the action upon the heart is secondary via the vagi.

2. Furthermore as will be seen by examining experiments No. 1 and No. 2, the strength of the alkaloid gelsemine is only about one fourth as great as that of gelseminine, also that the action in the case of gelseminine is much more lasting and profound. Again, these two alkaloids seem to have but little action in common.

3. The therapeutic value of these alkaloids has doubtless been overlooked; and now that they are to be obtained in the pure state their definite action will be utilized.

I wish to express my sincere thanks to my assistant, Mr. L. R. Hoffman, for his valuable aid.

BE AN ORIGINATOR.

Every tub should stand on its own bottom is a homely old proverb, but it is just as true now as when first spoken. Why should an intelligent druggist seek to imitate some successful preparation instead of trying to make one better? If the success of the article is due to good advertising and has merit, then the men who put their brains and money into it deserve their success and reward. If it is a fraud and is successful only because of the credulity and ignorance of the people, the druggist should shun it and not try to grab a few dollars by trailing behind the band wagon with a feeble imitation. It never pays. It is a mighty small man who is satisfied with the crumbs from the table; a real man wants to sit at the table himself, and this means that every druggist should be an originator, not an imitator. The follower always gets the leavings, the leader gets the prizes and the honors.—*American Druggist*.

Section on Pharmacopoeias and Formularies

Papers Presented at the Sixty-First Annual Convention

CONCERNING SOME OF THE PROPOSED ADDITIONS TO THE NATIONAL FORMULARY.

W. S. AMOS, PH. G.

When the formulas proposed for inclusion in the National Formulary were first made public the writer prepared a number of samples, of most of the elixirs, the two spirits, antiseptic solution of pepsin, aromatic castor oil, four tinctures liquid petroxolin, iodine petroxolin, one fluidextract and the fluidglycerates.

These preparations have been kept on a shelf in a room having a north exposure and at ordinary room temperature. Over a year has passed since they were made.

Compound spirit of cardamom made May 15, 1912, has darkened slightly and contains a slight precipitate. The taste suggests pimenta.

The writer made a sample of spirit using oil of pimenta, and from it an elixir which are superior to the spirit and elixir made as directed in the proposed formulas.

The compound spirit of vanillin made May 15, 1912, has darkened in color to a light brown; there is no precipitate.

Compound elixir of almond made May 15, 1912, has darkened slightly. The odor is that of orange flower water—"heavy" and unpleasant, the taste is at first pleasant but weak—afterwards that of the orange flower water and vanillin combination.

Aqueous elixir of licorice made May 15, 1912, has kept perfectly. We would suggest that the fluidextract of licorice of the formula be replaced by the fluidglycerate to be in keeping with the title, which suggests no alcohol.

Red elixir does not contain enough color and it is suggested that the amount of cudbear be doubled, so that the elixir may be diluted, as in prescription work, and the color still be noticeable.

Compound elixir of cardamom (made May 15, 1912) is cloudy, with precipitate. The taste is not unpleasant, but is too weak. The remarks above under spirit of cardamom will apply to this elixir.

Compound elixir of vanillin (made May 15, 1912) has darkened to a caramel brown. The taste is not pleasant. We consider this the poorest elixir of any proposed.

Elixir of three bromides has kept well but compound elixir of almonds is not a good vehicle for the bromides; sweetened water would do as well.

Compound elixir of sodium salicylate contains a precipitate and the taste is objectionable. It should not be included as proposed in the new formulary.

We made no samples of the formates elixirs; we do not believe there is demand enough for them to justify their inclusion in the National Formulary.

Antiseptic solution of pepsin (made Jan. 25, 1912) contains a slight precipitate, taste strongly acid—the odor indicates that the pepsin is old. The name "Physol" suggests a nostrum. Reject antiseptic solution of pepsin.

Liquor carbonis detergens should be admitted—but the directions for making it should be changed. The coal tar should be macerated in tincture of quillaja.

The writer has made several gallons of this preparation and has observed that coal tar is not soluble in the alcohol and forms a coating over the quillaja, so that the alcohol cannot act upon the latter.

Aromatic castor oil is a good preparation and is in demand; a slight increase in the oil of cinnamon is advisable. We suggest also that the kind of oil be definitely prescribed, as there is quite a difference between the flavor of oil of Ceylon cinnamon and oil of cassia, the latter being the most commonly stocked by druggists.

Syrup of poppy could well be replaced with a syrup of morphine hydrochloride. We would then have something definite, the elixir of morphine hydrochloride seems to be a preparation of value and is quite common in many drug stores today.

The tinctures proposed, excepting two, viz.: cactus grandiflorus and saw-palmetto and santal, should be included.

We find conflicting reports regarding the efficacy of tincture of cactus grandiflorus and think elixir saw-palmetto and santal would be a more useful preparation than the tincture.

The spray solutions are good combinations, if they would be used, but we notice most physicians employ their own formulas when prescribing sprays.

Salicylated mixture of iron, and compound gargle of guaiac, may have a local use somewhere, but they do not appeal to us as being of sufficient importance to justify their inclusion.

The borax honeys we pass without comment other than to say that our grandmothers had many such remedies.

The fluidextracts should be included. We made but one of this class, that of baptisia; it is a very satisfactory preparation.

The fluidglycerates should be increased in number. We made samples of all of the ones proposed, and they are satisfactory except that of cascara, which has a slight precipitate. Fluidglycerate of licorice we have had for three years and consider it the best form of licorice in fluid state; its uses may be many and the taste is much like that of ammoniated glycyrrhizin.

We predict that the fluidglycerates will become popular, excepting perhaps krameria, which is little used in the middle west.

Liquid petroxolin is an improvement on the one of the present formulary. The iodine petroxolin separated for us after two weeks standing.

We did not make the granulated effervescent salts, but they seem to be somewhat out of line with those in common demand.

It is a disappointment that the majority of the proposed formulæ are not such

preparations as those in demand by the medical profession in this section of the country.

If a manufacturing pharmacist should confine his manufacture to the preparations now official, including the formulas proposed, he would have to close his business as soon as his cash on hand was exhausted.

LABORATORY OF THE MCPIKE DRUG CO., KANSAS CITY, MO.

SOME COMMENTS ON THE PROPOSED FLUIDGLYCERATES OF THE N. F.

ERNEST R. SMITH.

The fluidglycerates, as proposed by the committee on National Formulary constitute a class of preparations in which each cc. contains the active constituents in 1 gm. of drug. They are intended to be of the same strength as the fluidextracts.

The menstuum contains 50 percent by volume of glycerin and no alcohol. This class of preparations, consisting of about 86, was first experimented on by Geo. M. Beringer. Five of them are now suggested for inclusion in the forthcoming National Formulary.

The writer made and tested the different preparations as suggested in the "Journal of the A. Ph. A., Vol. 1, No. 3," using 125 gm. of drug for 125 cc. of the finished product.

In each case the drug was ground by hand and passed through a sieve corresponding to the number of powder required.

Fluidglycerate of Glycyrrhiza. A number 20 powder was used and an alkaline menstuum. The writer experienced some difficulty with this preparation. The formula suggests that it be "*packed very lightly*." The drug being in a coarse powder the menstuum has a tendency to run through unevenly when packed as directed, but when packed a little more firmly the writer had no difficulty.

Using the prescribed amount of menstuum there was not enough to saturate the drug and leave a stratum above, and the chloroform water was used to make up the deficiency.

The finished product is a first class preparation and the taste is superior to the fluidextract. The peculiar sweetening properties of glycerin seem to do away with the slight acid taste which the fluidextract has.

It is of interest to note that in a preparation made 2 years ago, only a slight precipitate has formed, hence the keeping qualities are good.

Fluidglycerate of Krameria. No difficulty was experienced with this preparation and the finished product has every appearance of a good preparation.

Fluidglycerate of Cascara Sagrada. The writer met with the same difficulty as in the fluidglycerate of licorice, viz.: the amount of menstuum was not sufficient to saturate the drug and leave a stratum above.

The finished product seems to be of good quality, and the drug is entirely exhausted of its desirable constituents.

Fluidglycerate of Cascara Sagrada Aromatic. In this preparation there was insufficient amount of menstruum to saturate and leave a stratum above.

The finished product is an excellent preparation and the bitterness which Cascara possesses is entirely disguised.

Fluidglycerate of Rhubarb. The finished product is a thick, clear, brownish black liquid, free from sediment, and has the appearance of an excellent preparation.

The marc contained none of the active constituents of the drug, which shows that the drug was entirely exhausted.

In conclusion, it is the writer's opinion that the fluidglycerates, as a class, possess many advantages over the fluidextracts. They do away with alcohol which is expensive, and in some states, hard to obtain. Their keeping qualities are excellent. Also, alcohol is frequently therapeutically contraindicated, and these preparations give the physician a concentrated infusion.

It remains to be determined, whether the glycerol-water menstruum and chloroform water, dissolves any of the undesirable constituents from the drug.

LABORATORY OF THE MCPIKE DRUG CO., Kansas City, Mo.

THE EDUCATION OF THE PUBLIC.

The education of the public in matters pharmaceutical is being attempted in various (American) states, with the object of putting the druggist right in the eyes of the public. During the past decade certain lay newspapers have carried on campaigns against the proprietary medicine business, with the admitted object of destroying it. Recently there appeared in the "Ladies' Home Journal" an article entitled, "The Meanest Business in the World—Cheating the Sick," wherein remedies for women's ailments, soothing syrups, and headache and cough preparations were condemned as a class. Unfortunately, the writer made his attack too inclusive, stating that such medicines (excluding the first named) "all depend for their effect upon alcohol, and one or all of the stupefying drugs—opium, morphine, or chloroform." The writer went on to say that, "used to excess, they kill outright; used even in moderation, they gradually become a necessity to the child's system, and before the parents realize the danger they have on their hands a victim of the drug-habit." Such misstatements are freely copied by the newspapers throughout the country, with the result that an unmerited slur is cast upon the drug business. In order to combat this influence, the Wisconsin State Pharmaceutical Association has formed a publicity bureau, charged with the duty of disseminating among the country papers short articles that will set the druggist right in the public eye. The time has come when the public must be told that the maker of ready-made medicines is not necessarily a faker and charlatan.—*The Chemist and Druggist* (London).

Section on Education and Legislation

Papers Presented at the Sixty-First Annual Convention

THE LETTER OF THE LAW.

CHARLES H. LAWALL.

"There are nine and sixty ways of constructing tribal lays,
And every single one of them is right."

To one who has had practical experience in legal cases and has observed criminal court procedure from the standpoint of an impartial witness, the most noteworthy feature is the unvarying adherence to forms and customs which magnify the letter of the law, frequently to such an extent that the spirit of the law is either entirely lost to view or is so obscured by the mass of technicalities as to be practically unrecognizable as a factor in arriving at a verdict.

When an experienced criminal lawyer and brilliant district attorney are on opposite sides in a case presided over by an able judge, a feeling of bewilderment is experienced by the spectator who sees the real issue disappearing in the mists of legal controversy which arise over points non-essential to that real issue.

It is like some gigantic game which must be played strictly according to the rules and in which the stake is often human liberty or even life, where the jury and many of the participants and spectators, having very little knowledge of the "rules of the game," sit through the trial with but slight appreciation of the finer points that are argued and decided in the preliminary skirmishing which always characterizes a hard fought case. To the credit of our jury system be it said that, if the case actually reaches the jury for decision and no binding instructions have been given them by the judge who presides in the case, the jury is usually able to separate the wheat from the chaff and to decide the case strictly upon its merits.

The prosecution of food and drug adulteration cases is usually along simple, well defined lines, technical, literal or trivial though they may be. The defense, however, is hampered by no restrictions as to consistency and cases are sometimes tried in which the defense reminds one of the story, hypothetical, of course, of the man who was arrested for breaking a neighbor's axe which he had borrowed. His defense was along three lines: First, that the axe was sound when he returned it; second, that the axe was broken when he borrowed it; and third, that he had never borrowed the axe.

What must be the feelings of a layman in examples like one recently offered in an Eastern city, where a municipal ordinance was being enforced in prohibiting food adulteration, when a judge of one of the courts acted as attorney for the defense and attacked and overthrew the ordinance upon the purely technical

grounds that it had not been read and published the number of times required by law and that some of its penalties differed slightly from those prescribed by another municipal ordinance which had not been repealed and which, on account of its priority, took precedence over the later one in some particulars. No question as to the guilt or innocence of his clients was involved in this defense, that being made as an entirely separate and distinct effort, with the final outcome that his clients were found guilty but that the ordinance had been illegally passed and was therefore non-effective.

The prosecution of cases for technical breaches of laws where the spirit of the law has not been violated, have been frequently reported in pharmaceutical news columns. Take for example the celebrated tincture of *nux vomica* case in New Jersey many years ago, where adherence to the requirement then official in the U. S. Pharmacopœia, of a certain amount of extractive matter in the finished preparation resulted in the penalizing of a pharmacist whose preparation differed in this non-essential particular, although it was clearly proved that the alkaloidal strength (which is now the standard) was fully up to the requirements for a full strength preparation.

Another instance is found in the prosecutions brought for violation of the requirements in distilled water which was supposed, under the U. S. P. 1890 to leave no residue upon evaporation. It has since been proved that distilled water takes up small amounts of soluble matter from the glass containers in which it is kept, and this point is now covered by a more liberal provision of the standards in the matter of the residue, while retaining tests sufficiently rigid to exclude the use of raw water as a substitute, thus preserving the spirit of the requirements.

Few laws are fool proof in the hands of a commissioner or other official who wishes to multiply cases regardless of their actual merits. No pharmacist, however conscientious and careful he may be, is safe unless he has a knowledge of laws and requirements impossible to expect in one who has so many other and more important matters affecting the public health to occupy his attention. How many pharmacists know that only the "unpeeled" *calamus* is recognized in the Pharmacopœia or would hesitate to sell to the casual purchaser, who said that he wanted some *calamus* to make his own "bitters," the peeled rhizome usually found in the stores; and yet such a seller would be guilty of a technical violation of the law and could be legally prosecuted under any of the state food and drug acts which are in conformity with the national law. This may be dangerous information to place in the hands of some officials charged with the enforcement of these acts, but it illustrates the manner in which the letter of the law may be enforced irrespective of its spirit.

One instance which has occurred within the writer's experience, illustrating a ridiculously literal interpretation of the law, with just about as much justice in it as there would be in a *calamus* case, was of a drug commissioner who prosecuted a firm of wholesale druggists because their tincture of opium showed but 46 percent of alcohol, a difference of only several percent from the amount found in a tincture made by the official process under the most favorable conditions, and which might easily be accounted for by variation in the extractive matter present in the opium or slight loss during the final filtration. The alcoholic strength is made no part of the requirements of the tincture and is only inferential. It was

shown by the defendants and admitted by the Commissioner that the morphine strength of the laudanum was fully up to the standard, but much time, trouble and money was expended in defending a case which had absolutely no merit whatever from the standpoint of justice or of protection to the public.

The same kind of blind, unreasoning interpretation of laws and rulings was recently indulged in by an official in the Bureau of Animal Industry, who, in his over zealous efforts to enforce the new rulings regarding the declaration of cereal starches in sausage, discovered that coriander as commercially found upon the market, contained a few vetch seeds which were necessarily ground with the coriander and, notwithstanding the efforts of a dealer in spices to clean the seeds as far as was possible by mechanical means, ruled that "if the coriander seed contained only one vetch seed in a million it would necessitate the labeling of sausage in which a fraction of a percent of such coriander were used as seasoning, as containing leguminous starch." This may sound ridiculous, but it is a fact, and the spice dealer was forced to appeal to the Secretary of Agriculture to bring about a common sense interpretation of the ruling in question.

A case is also upon record where one of the Government departments turned down a sample of cresol (which is well known to be a varying mixture of three isomeric compounds) because it differed a decimal figure in the third or fourth place in its specific gravity from the official pharmacopœial requirements, although it was shown that the antiseptic and germicidal value was as high or even slightly higher than the average of samples conforming absolutely to the specific gravity of the Pharmacopœia.

It required a legal interpretation of the Federal Food and Drugs Act by the courts to decide that the silver coating on dragees or cachous is not a violation of that section of the Act which prohibits the use of mineral substances in confectionery and there is yet opportunity on the part of fanatic officials to prosecute candy manufacturers for the use of salt or cream of tartar, both of which are undoubtedly mineral substances within the literal meaning of the Act and both of which have a legitimate use in making certain kinds of candies. There is really no limit to the possibilities which may yet confront us in the matter of freak rulings and ridiculously technical prosecutions.

The injustice is not always on the part of the officials, however. Many manufacturers juggle words and phrases on their labels in a manner which reminds one of the episode in "Alice in Wonderland," where Alice and the Red Queen are conversing and the Red Queen offers Alice a position in which one of the inducements in the matter of wages is "jam every other day." Alice declines the offer saying that she does not care for any jam, whereupon the Red Queen's answers to the effect that it is just as well for "jam every other day means jam yesterday or jam tomorrow but never jam today."

The recently published cases of alleged adulteration of broken senna and of ground colocynth are examples of the lengths to which dealers will go in attempting to win a technical victory irrespective of the spirit of the law. The use of synonyms, such as "bitter apple" for colocynth, which constituted the defense in the case referred to, always leads, if not to ambiguity, at least to a basis for argument.

Synonyms are frequently used with about as much consideration and fore-

thought and with as much definiteness as in the following case which happened a number of years ago in my presence, and which is a fine example of their unreliability.

A party of men on a vacation trip in Pike County, Pa., where there are many French settlers, were sitting on the porch of the inn where they were stopping, when one of the typical French farmers came up the road carrying a large size vegetable which belonged unmistakably to the Cucurbitaceæ or gourd family. An argument immediately arose as to whether the specimen was a squash or a pumpkin and without any idea as to the ability of the peasant to decide such a momentous (?) question, a small bet was made by two members of the party and it was decided to leave it to the Frenchman. "What is the name of that vegetable?" asked the interlocutor, an unbiased member of the party. "It is ze squash," replied the peasant. Quick as a flash the man who had the losing side of the bet asked, "What is it used for?" Equally prompt was the reply on the part of the peasant, "To make ze punkin pie." Tableau! All bets declared off.

There is no doubt whatever that now, since the grosser forms of adulteration have been largely eliminated by the combined effect of a rigorous enforcement of the laws and the awakened consciences of the majority of manufacturers, the pendulum will swing even further than it yet has in the direction of basing prosecutions upon non-essential technical points, before we return to safe and sane conditions.

What we need to bring about a healthy condition in food and drug legislation is not large numbers of prosecutions based upon trivial or non-essential points, in which nominal fines (that act in no way as a deterrent) are imposed, but fewer and more wisely selected cases which involve basic principles where a penalty is imposed that really makes the defendant feel the weight of the punishment, and then to follow up these prosecutions by a continued enforcement of the law in similar cases until such violation is entirely stamped out. Concentration of effort, wisely directed, was never more needed than at present in matters pertaining to food and drug adulteration, for a continuation of some of the abuses of the past will bring about a chaotic condition in which the old laws will be discredited and no new legislation can be enacted.

Every honest manufacturer, and the large majority of them are honest, will welcome and uphold the enforcement of laws according to their spirit, but much of the opposition to food and drug legislation of any kind has been stimulated by the injustice which has often been done by the magnification of harmless technicalities into crimes of the first or second magnitude.

This change in the methods of conducting prosecutions must be accompanied by an equally sincere change on the part of some manufacturers who exert their efforts, not in seeing how good a product can be turned out, but how close they can come to violating the law without actually rendering themselves liable. When these two classes of reform have been brought about and when the letter of the law has ceased to be magnified out of all proportion to the spirit of the law, then and not until then, will we be considered as having really progressed.

STANDARDIZING A THREE YEAR COURSE.

HENRY L. TAYLOR, PH. D.

The Point of View Looks Forward: The December, 1912, Pharmaceutical Era contained an article in which National Standards in the schools of Pharmacy of the United States were discussed.

That analysis looked to the future rather than to the past, and the time seems opportune for discussing it.

As evidence that this conclusion is justified and to further establish the point of view let me quote from the proceedings of two pharmaceutical associations that met in Denver, August, 1912.

National Association, Boards of Pharmacy: "Your committee (Legislative) would, therefore, recommend that a National Committee on examinations be named by this Association, whose duty it shall be to provide the questions and direct the method of examination of all candidates desiring a National Reciprocal Certificate, and also rate the papers after the examination." The qualifications exacted of a candidate for a National certificate should be, not less than four years of practical experience, high school education, or its equivalent. Graduation from a school of pharmacy complying with all the requirements of the National Syllabus Committee.

"The adoption of this plan need not interfere with the Reciprocal Registration now in effect between the various states, nor in any sense does it serve to take the place of such registration, but it provides a plan whereby all states regardless of the law requirements may give an opportunity to a pharmacist who deserves it, a certificate of registration that will be evidence of his qualification to practice in any state and be recognized without being required to take another examination.

The American Conference of Pharmaceutical Faculties:

"There is a large and growing field for the preparation of municipal, state and federal inspectors, analysts and other administrators of food, and drug laws; of private analysts and others engaged in the higher lines of professional pharmaceutical work; of instructors and professors in pharmacy schools; of members of boards of pharmacy, who shall be really qualified for the performance of their high and difficult duties; of men qualified to take charge of manufacturing establishments or departments thereof. It is believed that the splendid facilities possessed by many of our pharmacy schools should be utilized in preparing such workers and that the practical instruction given in our better pharmacy schools is fully equal to that given in any of the scientific departments of the universities. If such an extension and elevation of the work of the pharmacy schools can be accomplished without in any way disturbing the conditions in the separate department, which is devoted to preparing students to become practicing pharmacists, this is a consummation devoutly to be wished, and one that cannot fail to reflect credit upon this conference for all time to come, and to place professional pharmacy on a far higher plane of reputation than it has ever before enjoyed."

From these quotations it is apparent that the next step upward in pharma-

ceutical education *is being taken*, and that the three-year course in process of standardization. It is my present purpose to attempt to show how this course lends itself to the proposed national license valid for the United States. The placing of the two quotations in juxtaposition seems well nigh sufficient. But there are details of the national license that must be worked out. Let us consider a tentative plan, and that you may follow it more intelligently, it is before you in type: *The Requirements for the National License.*

The life license valid for the United States shall be issued by the American Pharmaceutical Association.*

The examinations on which it is issued shall be conducted by the National Association of Boards of Pharmacy through the State Board signators to the agreement.

Satisfactory evidence verified by oath shall be required by the National Association of Boards of Pharmacy of all candidates for admission to the examinations. It shall admit to the examinations for the national license any candidate that pays a fee of \$25 and

- 1 Is more than twenty-three years of age;
- 2 Is of good moral character;
- 3 Had prior to beginning the first year of study in the school of pharmacy,
 - (a) At least the equivalent of one year's apprenticeship under pharmacists registered by the state board,
 - (b) A general preliminary education equivalent to the successful completion of a four years' course in a secondary school recognized by the state educational authorities;
- 4 Has studied pharmacology as outlined in the Pharmaceutical syllabus *not less than three years* in a registered or accredited school of pharmacy;
- 5 Has received the diploma of pharmaceutical chemist (Ph. C) from a school the member of, or affiliated with the American Conference of Pharmaceutical Faculties;
- 6 Has had two years successful experience as a licensed pharmacist, one year of which must have been in a pharmacy of the United States.

The Standard Three Years Course: The discussion of the requirements for the three years course may emphasize as many points as there are requirements, including such questions as the general preliminary education for admission to the school; the professional subjects and the time devoted to them; the general culture subjects and their relative values.

It is not my purpose (and some may think it not my province) to discuss the professional side of the subject. What subjects should comprise the course and what proportion of time be given each is now being worked out in the best of laboratories—the stronger schools of the country. Moreover other organizations are discussing its underlying principles, outlining and perfecting their details. Their conclusions will be reported in due time.

The emphasis will be thrown on the general preliminary education in the following: "You can do a great deal in pharmaceutical education by emphasizing the absolute necessity of more preliminary education before the study is undertaken. The trouble is that matriculates of one year high school education cannot grasp the intricacies of pharmaceutical education.

*(The recognition of such a license would be wholly optional with the various states.—EDITOR.)

It is deplorable that otherwise intelligent men cannot see the folly of their activity—the standardization of a degree that will make us appear ridiculous in the eyes of intelligent people.”

Absolute Necessity of More Preliminary Education: How shall this necessity be emphasized? How many of you this year looked into the faces of the graduating class of your local grammar school? Note that I said grammar school, *not* high school; the latter experience is more common and the exercises more formal.

You saw, did you not? Children on the average less than fifteen years old. *American* children, not European, Asiatic, African, or Australian. Children just entering the period of adolescence. One year later you will miss from that class how many that have died physically? how many that have died intellectually? how many that have lagged behind from unavoidable reasons,—sickness or removal of person or family? But there has been a survival,—*wonderful* when one thinks of the perils of the period; *pitiable*, when one views the wreckage.

After ten years campaign you have persuaded yourselves that it is reasonable to require that your profession be recruited from the ranks of the survivors. *What* is the physical condition of these survivors of the first year of high school life? They are our boys of sixteen and our girls of fifteen on the average, who have just entered on that marvelous period of life—the period of adolescence.

Their intellectual capacity is being measured by what tests? Fair ability to read, write and think the ideas of simple arithmetic through proportion, English of Cooper and Longfellow; the Elements of Algebra, of History, of Latin, of Drawing, and of Biology.

And what is their moral fiber? The sixteen year old powers of children attracted by the movies; listening to the growls against graft; interested in the national game and tempted by the glitter of gain at the expense of others, at the expense of principles, at the expense of self.

After years of study your experts are in practical agreement that your recruits from the survivors should, during the next five years, acquire a practical experience of at least from one to five years. But you are not agreed as to what that experience shall be. You are not clear in your definition of apprenticeship. Some of you say that the recruit washing glasses at a soda fountain becomes thereby learned—*doctus*, a doctor; while others affirm that a recruit older and wiser by those additional years of high school instruction working under the skilled instruction of a teacher in the dispensary department of a university course does not acquire the requisite skill.

What are you advising your recruits from the survivors of the first high school year to do with the half decade of their life between the date of their survival of your preliminary tests,—the promotion examinations to the second high school year,—and their final tests—the examinations of your State Boards? Are you requiring them to pack themselves full of the educational opportunities you and others furnish so lavishly by public and private munificence in high schools and schools of pharmacy from Maine to California, and from Minnesota to Texas. Or, the rather, are you letting them waste the five years, acquiring little intellectual power and less moral fiber?

How are you helping parents in the critical period of the family's life—the period of adolescence? Are you going out into the highways and hedges and

compelling them to come into the feast spread for them in schools and colleges, to enjoy at the feast the society of the great of all ages?

A generation ago the thought of a compulsory school law was intolerable to the American voter. Today the compulsory school law is common throughout the United States for the elementary school. Is not the prerequisite clause in the professional laws in effect a compulsory law for secondary schools?

Does not the duty lie with your profession to help in securing to the parents, to the teachers, to the school officials the help of a prerequisite law, for admission to the practice of pharmacy in its simplest forms?

And is not the corollary equally clear? That the higher forms of license make more preliminary education "absolutely necessary?"

The Prerequisite Clause: Let us in closing throw the emphasis on the necessity for an aggressive campaign to secure this beneficent regulation in all states not now passing it. Such campaign properly lies with the N. A. B. Ph. and the A. Ph. A. The joint sessions of these bodies afford the opportunities for outlining and directing the propaganda. Only a definite plan is necessary to inaugurate the movement.

PHARMACY LAWS PROPOSED, ENACTED OR AMENDED DURING 1912-1913.*

FRANK H. FREERICKS.

(Concluded from February Issue.)

MISCELLANEOUS PHARMACY LAWS PROPOSED OR ENACTED.

ANTI-TRUST AND UNFAIR COMPETITION LAWS OF NEW JERSEY OF 1913.

1. It shall be unlawful for any person, firm, corporation or association, engaged in the production, manufacture, distribution or sale of any commodity of general use, or rendering any service to the public, to discriminate between different persons, firms, associations or corporations, or different sections, communities or cities of the state, by selling such commodity or rendering such service at a lower rate in one section, community or city than another, or at a different rate or price at a point away from that of production or manufacture as at the place of production or manufacture, after making due allowance for the difference, if any, in the grade, quality or quantity, and in the actual cost of transportation from the point of production or manufacture, if the effect or intent thereof is to establish or maintain a virtual monopoly, hindering competition, or restriction of trade.

*Continuation of the report of the secretary of the Section on Education and Legislation. See Journal for January, p. 67, and February, p. 196.

2. Any person or corporation violating this act shall be guilty of a misdemeanor and on conviction thereof shall be punished accordingly.

3. This act shall take effect immediately.

Approved February 19, 1913.

1. It shall be unlawful for any merchant, firm or corporation, for the purpose of attracting trade for other goods, to appropriate for his or their own ends a name, brand, trade-mark, reputation or good will of any maker in whose product said merchant, firm or corporation deals, or to discriminate against the same, by depreciating the value of such products in the public mind, or by misrepresentation as to value or quality, or by price inducement, or by unfair discrimination between buyers, or in any other manner whatsoever, except in cases where said goods do not carry any notice prohibiting such practice, and excepting in case of a receiver's sale, or a sale by a concern going out of business.

2. Any person, firm or corporation violating this act shall be liable at the suit of the maker of such branded or trade-marked goods, or any other injured person, to an injunction against such practices, and shall be liable in such suit for all damages directly or indirectly caused to the maker by such practices, which said damages may be increased threefold, in the discretion of the court.

3. This act shall take effect immediately.

Approved April 1, 1913.

THE DEFEATED ITINERANT VENDOR'S BILL OF OHIO.

Be it enacted by the General Assembly of the State of Ohio:

Section 1. Any person, firm or corporation desiring to engage either as principal or as agent, in the business of selling, or vending by peddling, or by canvassing from house to house, or by vending from valise, pack, bundle, wagon or other vehicle, or by public out-cry, or upon the street or public highway, any drug or medicine, or any combination or mixture of drugs and medicines recommended for the cure, treatment or mitigation of disease, injury, or deformity, either of men or other animals, shall apply to the state dairy and food commissioner for a license, or for a certified copy thereof as provided in section two of this act, authorizing such peddling, canvassing, selling or vending.

Every application shall be in the form prescribed by the state dairy and food commissioner, and shall particularly set forth the drugs, medicines, or combinations or mixtures thereof desired to be vended or sold, and shall be accompanied by samples of such drugs, medicines, combinations or mixtures, and if a compound or mixture, by a true statement of the composition thereof, and by copies of the circulars, labels or other printed matter by which such articles are to be accompanied or advertised.

If the state dairy and food commissioner is satisfied that such application is in the proper form and that the drugs, medicines, combinations or mixtures proposed to be sold or vended do not contain poisonous or habit-forming drugs in greater proportion than is permitted by law, or alcohol in greater proportion than is necessary to preserve or hold the essential ingredients of such drugs, medicines, combinations or mixtures in solution, and that such preparations cannot be used as alcoholic beverages nor to create or satisfy a drug habit, and that they are not dangerous to life or health, nor intended for unlawful or immoral

purposes, he shall upon receipt of the fees hereinafter described, cause to be issued to such applicant a license authorizing the selling, peddling or vending of such drugs, medicines, combinations or mixtures thereof.

Such license shall particularly describe the drug, medicine, combination or mixture authorized to be sold thereunder, the name of the person, firm or corporation to which the license is issued, the date when such license expires, and shall be signed by the state dairy and food commissioner.

It shall be unlawful for the state dairy and food commissioner or for any inspector of any employe of the state dairy and food department to disclose any information concerning the composition of any drug, medicine, compound or mixture which is set forth in any application for license under this act, except in legal proceedings instituted for the enforcement of this act or of other provisions of law. Nothing in this or in any other section of this act shall be construed to affect the operation of any provision of law regulating the practice of pharmacy, medicine, dentistry, or veterinary medicine, or regulating the sale of alcoholic liquors, habit-forming drugs, or of food and drugs, nor shall it be construed to suspend or avoid the operation of any legal ordinance of any municipality regulating the itinerant vending or peddling of drugs, medicines or other articles.

Section 2. The state dairy and food commissioner shall be authorized to charge and collect the sum of ten dollars (\$10.00) for each such license, and if the sale of more than one drug, medicine, compound or mixture is authorized thereunder, he shall be authorized to charge and collect the sum of one dollar (\$1.00) for each such additional drug, medicine, compound or mixture. No person, firm or corporation shall be required to procure more than one license for the sale of any preparation, but each agent shall be required to carry with him the license obtained by his principal, or a certified copy thereof, and to produce the same for inspection when requested to do so by any officer of the law, or by any inspector of the state dairy and food department, and when more than one agent or canvasser is employed by any person, firm or corporation, the state dairy and food commissioner shall furnish certified copies of such license for each of such agents or canvassers and shall charge the sum of two dollars (\$2.00) for each copy thereof. No license shall be issued for a longer period than one year.

The state dairy and food commissioner shall cause a record to be kept of such licenses issued under this act, to whom issued and of the dates of expirations thereof, which licenses shall be consecutively numbered, and all drugs, medicines, combinations or mixtures thereof, authorized to be sold or vended thereunder shall bear a label upon which is printed in plain and easily read letters the words, "Sale authorized by Ohio license No. ———" accompanied by the serial number of such license and the date when such license will expire.

Section 3. Any person, firm or corporation, who, either as principal or agent, shall sell or offer for sale, by peddling, or by canvassing from house to house, or by vending from valise, pack, bundle, wagon or other vehicle, or by public out-cry, or upon the street or public highway, any drug or medicine, or any combination or mixture of drugs and medicines recommended for the cure, treat-

ment or mitigation of any diseases, injury or deformity, either of man or other animals, without first having obtained a license from the state dairy and food commissioner as hereinbefore provided, or any one who shall state falsely the composition of any drug, medicine, combination or mixture in any application for license under this act, shall be deemed guilty of a misdemeanor, and upon conviction shall be fined not less than fifty dollars (\$50.00) nor more than two hundred dollars (\$200.00) for the first offense, and on any subsequent conviction for the same offense shall be fined not less than two hundred dollars (\$200.00) nor more than five hundred dollars (\$500.00).

All license and other fees and all fines collected under this act shall be paid to the state dairy and food commissioner, and by him shall be paid into the state treasury, where they shall be disposed of according to law.

Section 4. It shall be the duty of the state dairy and food commissioner to administer the provisions of this act, to investigate charges of violation of any of the said provisions, to prosecute or cause to be prosecuted any person, firm or corporation guilty of such violation and to make such proper and lawful rules and regulations as may be necessary to carry the provisions of this act into effect.

NEW YORK WEIGHTS AND MEASURE LAW.

Section 1. Chapter twenty-five of the laws of nineteen hundred and nine, entitled "An act relating to general business, constituting chapter twenty of the consolidated laws," is hereby amended by adding thereto, at the end of article two, eight new sections, to be sections sixteen, sixteen-a, seventeen, seventeen-a, seventeen-b, seventeen-c, eighteen, and eighteen-a, respectively, as follows

Section 16. Method of sale of certain commodities. All meat, meat products and butter, shall be sold or offered for sale by weight. All other commodities not in containers shall be sold or offered for sale by standard weight, standard measure or numerical count, and such weight, measure or count shall be marked on a label or a tag attached thereto; provided, however, that vegetables may be sold by the head or bunch.

Section 16-a. Certain sizes of containers when used for vegetables, produce and fruit prescribed. No person shall manufacture, sell, offer or expose for sale containers for vegetables, produce or fruit that are not of the capacity of one barrel, half-barrel, one bushel, or multiples of the barrel, or sub-multiples of the bushel divisible by two; provided, however, that fruits, vegetables and produce may be sold in other sized containers if the net capacity in terms of standard dry measure is plainly and conspicuously marked, branded or otherwise indicated in the English language on the outside or top thereof, or is marked in accordance with the provision of section seventeen. A barrel within the meaning of this and the ensuing sections of this article shall represent a quantity equal to seventy hundred and fifty-six cubic inches or conform to the following dimensions. Head diameter, seventeen and one-eighth inches; length of stave, twenty-eight and one-half inches; bilge not less than sixty-four inches outside measurement; distance between heads not less than twenty-six inches; and to be known as a standard barrel. A reasonable variation of the capacity specified shall be allowed.

Section 17. Net contents of containers to be indicated on the outside thereof. When commodities are sold or offered for sale in containers of other sizes than

those specified in section sixteen-a or whose sizes are not otherwise provided by statute, the net quantity of the contents of each container, or a statement that the specified weight includes the container, the weight of which shall be marked, shall be plainly and conspicuously marked, branded or otherwise indicated on the outside or top thereof or on a label or a tag attached thereto in terms of weight, measure or numerical count; provided, however, that reasonable variations shall be permitted.

Section 17-a. When sections sixteen, sixteen-a and seventeen shall not apply. Sections sixteen, sixteen-a and seventeen shall not apply to containers or commodities in containers with ornamentations or decorations exclusively for gifts or social favors, or to commodities dispensed for consumption on the premises, or to commodities or containers put in receptacles used merely for the purpose of carrying or delivering of commodities or containers complying with the provisions of such sections, or when the numerical count of the individual units is six or less, or in the case of liquids when the contents is two fluid ounces or less, or when the weight of the contents is three avoirdupois ounces or less, or to commodities packed, put up or filled prior to eight months after this section takes effect or to bottles used for the purpose of the bottling of spirituous, maltous, vinous, or carbonated beverages until eight months after this section takes effect.

Section 17-b. Guaranty furnished by wholesaler, jobber or manufacturer. No person shall be prosecuted under the provisions of this article, following section fifteen thereof, when he can show guaranty signed by a wholesaler, jobber or manufacturer, residing in the State of New York from whom he purchased the commodity in containers to the effect that they were not incorrectly marked within the meaning of such sections of this article. The person making the sale and guaranty shall then be amenable to the prosecution, fines, and other penalties, which would in due course attach to the dealer under the provisions of such sections. The name appearing on the container and the marking as provided by section seventeen shall be deemed to constitute a guaranty.

Section 17-c. Definition of terms "container" and "person." "A container" as used in this article, following section fifteen thereof, shall include any carton, box, crate, barrel, half-barrel, hamper, keg, drum, jug, jar, crock, bottle, bag, basket, pail, can, wrapper, parcel or package. "A person" as used in such sections shall be considered to import both the singular and the plural and shall include corporations, companies, societies and associations, and whether acting through an agent or servant.

Section 18. Examination and prosecution. The examination of the weight, measure or numerical count of the contents of containers as provided by section seventeen shall be made by the State superintendent of weights and measures or under his supervision or direction by any of the weights and measures officials of the State; except that in the city of New York such examination shall be made by the commissioner of the mayor's bureau of weights and measures of the city of New York. When after such examination there is cause to believe that a provision of section seventeen has been intentionally violated the State superintendent of weights and measures shall, after notifying in writing the person so accused of such accusation, certify the results to the attorney-general with a copy

of the results of the examination duly authenticated under oath by the official making examination. The attorney-general shall cause appropriate proceedings in the name of the people of the State of New York to be commenced and prosecuted in the proper courts of the State without delay for the enforcement of the penalties therefor; except that in the city of New York the commissioner of the mayor's bureau of weights and measures shall in cases where he acts, after notifying in writing the person so accused of such accusation certify the result to the attorney-general, with a copy of the result of the examination duly authenticated under oath by the official making such accusation. Such attorney-general shall cause appropriate proceedings in the name of the people of the State of New York to be commenced and prosecuted in the courts of the State of New York without delay for the enforcement of the penalties therefor. The State superintendent of weights and measures with the co-operation of the chief or principal weights and measures officials of the cities of the first class shall establish uniform tolerances or amounts of reasonable variation and shall make uniform rules and regulations for carrying out the provisions of sections sixteen, sixteen-a, seventeen, seventeen-a and seventeen-b.

Section 18-a. Penalties. A person violating any of the provisions of sections sixteen, sixteen-a, seventeen, seventeen-b, shall be punished by a fine of not less than twenty-five dollars nor more than one hundred dollars for the first and second violations, and by a fine of not less than one hundred dollars nor more than five hundred dollars for subsequent violations.

Section 2. Section nine of such chapter and section two hundred and sixty-three of chapter nine of the laws of nineteen hundred and nine, entitled "An act in relation to agriculture, constituting chapter one of the consolidated laws," are hereby repealed.

Section 3. This act shall take effect June first, nineteen hundred and thirteen.

THE WEST VIRGINIA PROHIBITION LAW EXEMPTION WITH REFERENCE TO PHARMACY.

Section 4. The provisions of this act shall not be construed to prevent any one from manufacturing for his own domestic consumption wine or cider; or to prevent the manufacture from fruit grown exclusively within this state of vinegar and non-intoxicating cider for use or sale; or to prevent the manufacture and sale at wholesale to druggists only of pure grain alcohol for medicinal, pharmaceutical, scientific and mechanical purposes, or wine for sacramental purposes by religious bodies; or to prevent the sale and keeping and storing for sale by druggists of pure grain alcohol for mechanical, pharmaceutical, medicinal and scientific purposes, or of wine for sacramental purposes, by religious bodies, or any United States Pharmacopœia or National Formulary preparation in conformity with the West Virginia pharmacy law, or any preparation which is exempted by the provisions of the national pure food law, and the sale of which does not require the payment of a United States liquor dealer's tax. But no druggist shall sell any such grain alcohol except for medicinal, scientific pharmaceutical and mechanical purposes, or wine for sacramental purposes, except as hereinafter provided, and the same shall not be sold by such druggist for medicinal purposes,

except upon a written prescription of a physician of good standing in his profession and not of intemperate habits, or addicted to the use of any narcotic drug, prescribing the amount of alcohol, the disease or malady for which it is prescribed, and how it is to be used, the name of the person for whom prescribed, the number of previous prescriptions given by such physician to such person within the year next preceding the date of such prescription, and stating that the same is absolutely necessary for medicine, and not to be used as a beverage, and that such physician, at the time such prescription was given, made a personal examination of such person, and that such person is known to such physician to be of temperate habits and not addicted to the use of any narcotic drug, and only one sale shall be made upon such prescription, and such prescription shall be at all times kept on file by such druggist and open to the inspection of all state, county and municipal officers. It shall be the duty of such druggist to register in a book kept for that purpose all prescriptions from physicians mentioned in this section, stating the name of the party for whom prescribed, the date of the prescription, the name of the physician by whom the prescription is issued, the quantity of such alcohol and the use for which prescribed, and such record shall at all times be open to the same inspection as such prescriptions.

It shall be lawful for a druggist to sell grain alcohol for pharmaceutical, scientific and mechanical purposes, or wine for sacramental purposes by religious bodies, only to any person, not a minor, and who is not of intemperate habits, or addicted to the use of narcotic drugs, who shall, at the time and place of such sale, make an affidavit in writing signed by himself before such druggist, or a registered pharmacist at the time and place in the employ of such druggist, stating the quantity and the time and place and fully for what purpose and by whom such alcohol or wine is to be used; that affiant is not of intemperate habits or addicted to the use of any narcotic drug; and that such alcohol or wine is not to be used as a beverage, or for any purpose other than that stated in such affidavit. Such affidavit shall be filed and preserved by such druggist and be subject to inspection at all times by any state, county or municipal officer, and a record thereof made by such druggist in the record book mentioned in this section, showing the date of the affidavit, by whom made, the quantity of such alcohol or wine, and when, where, for what purpose and by whom to be used. Only one sale shall be made upon such affidavit, and only in the county where the same is made, and no greater quantity than is therein specified. For the purpose of this act, any druggist or registered pharmacist making such sale shall have authority to administer such oath.

If any druggist, owner of a drug store, registered pharmacist, clerk or employe shall upon such prescription or affidavit, or otherwise, knowingly sell or give any such alcohol or wine to any person who is of intemperate habits or addicted to the use of any narcotic drug, or knowingly sell or give the same to any one to be used for any purpose other than that named in said affidavit or prescription, or who shall sell or give away any liquors without such affidavit or prescription, he shall be deemed guilty of a misdemeanor and punished by fine of not less than one hundred nor more than five hundred dollars and confined in the county jail not less than thirty days nor more than six months. In any prose-

cution against a druggist, owner of a drug store, registered pharmacist, clerk or employe, for selling or giving liquor contrary to law, if a sale or gift be proven, it shall be presumed that the same was unlawful in the absence of satisfactory proof to the contrary and the presentation of such prescription or affidavit by the defendant at the time of the trial for such sale or gift, shall be sufficient to rebut the presumption arising from the proof of such sale or gift. Provided, the jury shall believe, from all the evidence in the case, that such sale or gift was made in good faith under the belief that such prescription or affidavit and statements therein were true; and, provided, however, that such druggist, owner of a drug store, registered pharmacist, clerk or employe shall have complied with all other provisions of this act relating to the sale or gift.

An indictment against any druggist, registered pharmacist, clerk or employe, for any offense committed under the provisions of this section, shall be sufficient, if in the form and effect following:

State of West Virginia,

County of....., to-wit:

In the Circuit Court of said County:

The grand jurors in and for the body of said county of.....
, upon their oaths do present that A. B., within one year next
 prior to the finding of this indictment, in the said county of.....
 did unlawfully sell, give, offer, expose, keep and store for sale and gift, liquors,
 against the peace and dignity of the State.

Section 5. If any person who is of intemperate habits or addicted to the use of any narcotic drug shall make the affidavit mentioned in the preceding section, or if any person making such affidavit shall use as a beverage, or for any purpose, or at any place other than that stated in such affidavit, or shall knowingly permit another to do so, said alcohol or wine, or any part thereof, or shall knowingly make any false statement in such affidavit, he shall be guilty of a misdemeanor and upon conviction be punished by a fine of not less than one hundred nor more than five hundred dollars, and be confined in the county jail not less than two nor more than six months for the first offense hereunder; and for the second offense he shall be deemed guilty of a felony and punished by confinement in the penitentiary not less than one nor more than five years.

And if any physician who is not in good standing in his profession, or who is of intemperate habits, or who is addicted to the use of any narcotic drug, shall issue any such prescription as is mentioned in the last preceding section; or if any physician shall issue such prescription without, at the time, making a personal examination of the person for whom the liquor is prescribed, or shall prescribe for any person who is in the habit of drinking to intoxication and whom he knows, or has reason to believe is in the habit of drinking to intoxication, or shall give such prescription and make the statements therein required, or any part thereof, falsely he shall be deemed guilty of a misdemeanor and upon conviction thereof shall be fined not less than one hundred nor more than five hundred dollars and imprisoned in the county jail not less than thirty days nor more than six months, and in addition thereto, for the first offense under this statute, the court may, in its discretion, suspend the license of such physician for a period of six

months and for each offense thereafter the court shall suspend such license for a period of six months.

THE CIGARETTE LAW OF PENNSYLVANIA.

Section 1. Be it enacted, etc., That any person who shall furnish to any minor, by gift, sale or otherwise, any cigarette or cigarette paper, shall be guilty of a misdemeanor, and upon conviction thereof shall be sentenced to pay a fine of not less than \$100.00, nor more than \$300.00.

Section 2. Any minor, being in possession of a cigarette or of cigarette paper and being by any police officer, constable, juvenile court officer, truant officer or teacher in any school, asked where and from whom such cigarette or cigarette paper was obtained, who shall refuse to furnish such information, shall be guilty of a misdemeanor; and upon conviction thereof, before any alderman, magistrate or justice of the peace, such minor, being of the age of sixteen years or upwards, shall be sentenced to pay a fine not exceeding \$5.00 or to undergo an imprisonment in the jail of the proper county not exceeding five days or both. If such minor shall be under the age of sixteen years, he or she shall be certified by such alderman, magistrate or justice to the juvenile court of the county, for such action as to said court shall seem proper.

Section 3. The act approved May 7, 1889, entitled, "An Act to prohibit the sale of cigarettes to persons under the age of sixteen years and prescribing the punishment for the same" and the act approved April 4, 1903, entitled, "An Act for the protection of the health of persons addicted to the smoking of cigarettes, and imposing a fine for the violation of its provisions" and the Act approved the 16th day of March, 1905, entitled, "An Act for the protection of the health of persons addicted to the smoking of cigarettes and imposing a fine for the violation of its provisions, approved April 4, 1903" and all other acts and parts of acts inconsistent with the provisions of this act, are hereby repealed.

Approved the Ninth day of May, A. D. 1913.

John K. Tener.

The foregoing is true and correct copy of the Act of the General Assembly, No. 137.

Robert McAfee,
Sec. of the Commonwealth.

THE NEW HONEST ADVERTISING LAW AS PROPOSED AND ENACTED IN MANY STATES.

Be it enacted, etc.:

Any person, firm, corporation or association who, with intent to sell or in any wise dispose of merchandise, securities, service, or anything offered by such person, firm, corporation, or association, directly or indirectly to the public for sale or distribution, or with intent to increase the consumption thereof, or to induce the public in any manner to enter into any obligation relating thereto, or to acquire title thereto, or an interest therein, makes, publishes, disseminates, circulates, or places before the public, or causes, directly or indirectly, to be made, published, disseminated, circulated, or placed before the public, in this state, in a newspaper

or other publication, or in the form of a book, notice, hand-bill, poster, bill, circular, pamphlet, or letter, or in any other way, an advertisement of any sort regarding merchandise, securities, service, or anything so offered to the public, which advertisement contains any assertion, representation or statement of fact which is untrue, deceptive or misleading, shall be guilty of a misdemeanor.

MODERN SHOE POLISHES AND DRESSINGS.

By far the most important and widely used dressing is "*Ladies' dressing*," so called for its use on women's and children's footwear of kid and goat leathers. It is essentially a colored solution of shellac; borax, or an alkali, being the solvent and nigrosin the color. A little glycerin is usually added to prevent cracking and to preserve the softness of the leather. It is applied with a sponge and leaves, when dry, a soft, pleasing gloss. If soap solution is added to "*Ladies' dressing*" it becomes "*Gun-metal dressing*." This does not dry bright, but leaves a dull, gun-metal finish. *Patent leather dressing*.—This is usually simply olive or cottonseed oil, or vaseline, or white wax and turpentine. To hide cracks in patent leather, a solution of gun-cotton in amyl acetate, colored with a black spirit-soluble dye. *Nappy dressing*, for ooze, suede, castor, and nappy leathers is wood alcohol tinted with a color insoluble in water. The alcohol cleans the nap, and leaves the color, which, being insoluble in water, does not soil damp garments. *White leather dressings* may be the old-fashioned pipe-clay, or pipe-clay mixed with light magnesium carbonate. The latter gives a better white than pipe-clay alone. Another white dressing is zinc oxide suspended in water with a small quantity of an adhesive. This is applied with a sponge. These white dressings may obviously be tinted with umber, ochre, or other pigments, for canvas shoes of various shades. *Polishes*.—Carnauba wax is the basis of the best modern friction polishes. Candelilla wax may be substituted for the cheaper qualities of polishes. The wax is boiled until emulsified with a solution of borax. The product is known as "white stock." If a paste is required, this "white stock" is mixed with a sufficiency of hot, strong solution of common yellow soap and tinted with nigrosin. A soft paste is thus obtained. If a liquid is required, the best Castile soap is used, as this does not gelatinize on cooling. With moderate friction, the hard waxes held on the leather by the soap give a fine polish. Another method is to melt carnauba or candelilla wax, or a mixture of these, with paraffin wax or beeswax in hot turpentine, and mix with very finely powdered animal black. A firm paste is thus obtained, which easily spreads. When this is poured into boxes, it must be quickly cooled, or separation of the waxes may occur. Beeswax gives a toughness and lack of shortness to the paste, with a smooth finish, which cannot be obtained without it. For *tan leather polish* the basis is the same, but brown or yellow dyes are used instead of nigrosin. *Liquid shoe cleaner* is merely mucilage of tragacanth containing a little oxalic acid in solution.—J. T. Donald, (*J. S. C. I.*, 1913, 32, 459, through *Pharmaceutical Journal*.)

Section on Practical Pharmacy and Dispensing

Papers Presented at the Sixty-First Annual Convention

THE MOST DIFFICULT THINGS TO LEARN IN DISPENSING.

HENRY P. HYNSON, PHAR. D., BALTIMORE.

The acts, the manipulations and the solving of the dispensing problems to which I refer, may be considered difficult to learn, because, comparatively, few learn to do them easily and well, and because actual experience in teaching, plainly and forcefully impresses the fact upon every careful observer. It must not be understood that I have in mind complex problems in higher physics, complicated chemical combinations, the differentiation of allied botanical species or the identification of peculiar plant cells. No, none of these are near so difficult to become familiar with and master as are the every day doings of the modern drug store; such things as the ultra scientific look upon as far beneath their notice.

It may be questioned whether or not all these very ordinary things are difficult to learn or are difficult to teach and there may be other questionings regarding them, for instance, whether their accomplishment is dependent upon natural fitness, adaptability or application; certain it is, that, no matter how secured, one must possess, at least, a moderate amount of *ability to justly estimate the relative value of pharmaceutical doings* before he can learn to meet the requirements just now under consideration; this is intended to mean that unless he regards these common place acts as essential to true success, he will not acquire sufficient knowledge regarding them to meet the actual demands of his vocation.

Touching the subject of special talents or particular fitness, much of interest may be gained from the experiences of teachers of pharmacy. From my own very limited opportunities, I unhesitatingly conclude that so called special talents or natural inclinations are no more or less than results of accidental environment and accidental training. Sensitiveness or, perhaps, vanity has lead me to closely observe students in this regard, and it is a most peculiar fact or, better, a most gratifying fact, that it is invariably the case that students do work in dispensing that is exactly consistent with the work they do in other laboratories and, further, their examinations in the theories of dispensing are almost without exception of the same value as their examinations in the theories of other branches of pharmacy. This is very interestingly shown, in that class of students with which every teacher is familiar: those who impress their instructors favorably and as making excellent progress, but who painfully disappoint when put to a real test. It is believed that these positive observations should finally become helpful, when we decide that a more intelligent segregation of students of all kinds will be the real beginning of better educational methods.

I admit that it may be well to let this discussion pass, for it matters not to us or to many more whether these dispensing accomplishments are difficult to learn or difficult to teach, the fact remains that many of them must be acquired without teaching; also, that few there are in pharmacy today, who have acquired that dexterity and facility in manipulation that to some of us seems an actual essential to worthy success.

It may also be wondered or questioned whether the want or appreciation of the difference, the very great difference between the doing and the *well* doing of things is an infirmity or something that follows a lack of standards. This applies more particularly and with remarkable directness to nearly all very common-place doings; for instance, to walking and talking. Why do so many of us talk badly or, why do we not walk better? These surely are usual and very generally performed acts. Probably, some of us have forgotten, because much of it happened very early in our lives, what great difficulty we experienced and how much pain we suffered in learning to balance ourselves that we might stand upright and move about. Word sounding and word arrangement was not easily acquired and has not yet been fully accomplished. Some of us have never stopped, probably, to ascertain whether our manner of speech is creditable, or not, and there are others who suppose that, to "get along," is all that is required of the walker. Undoubtedly, it is *very, very* difficult either to walk or talk and that is why so comparatively few are highly accomplished in these most becoming essentials. It is quite likely, however, that many are unfortunately unattractive walkers and talkers because there are no sufficiently well-fixed and generally published standards for walking and talking. There are, though, examples of excellence in these with which we may compare our own similar actions and there may be found examples worthy of close study and possible imitation. It is of the "walking" and "talking" in dispensing that I am writing; therefore, all this applies with direct and particular force, to the subject under consideration.

All the difficulties to which I have referred and shall refer, may be easily divided into two classes: those which require mental effort alone, and those which require carefully controlled physical force of greater or less amount, but always properly directed by a mind which has been trained to direct it.

I am uncertain as to the proper sequence of my classes of difficulties. If I knew which was first created, my mind or my body I could better arrange them; after all, these troubles of the dispenser are a confusion of mind and matter and the supremacy is yet, I believe, undetermined. In 1907, I must have thought the body "had the call" for I then presented a paper, at the New York meeting, under the caption, "The Hands and Eyes in Dispensing," (Proceedings, Volume 55, page 124), which is closely related to this discussion and I will be happy if any of my hearers or readers are sufficiently interested to read or re-read that effort, in connection with this later one.

It is decidedly "bromidic" as society folk say, to refer to the general difficulty of applying knowledge, but no matter how common-place this difficulty, it pertains, especially to dispensers, it is fundamental and remarkably prevalent. May not the teachers of the abstract sciences, attached to pharmacy, or the text books be somewhat to blame. The difficulty is not so great in connection with very special subjects, but it is pronounced when general or fundamental teachings are

involved. It may be that we give our dispensing students too much education and not enough training; actual dispensing exercises.

To apply and helpfully use knowledge, then, is difficult to learn. One may have run through the reaction of iron, repeatedly; may have made the solution of its chloride from the metal, oxidized it, diluted the solution with alcohol to make the tincture and then forget that it contains iron, that the iron is in the ferric state, that a chloride is present, that it is strongly alcoholic and decidedly acid. This is not the case with students, only, nor with the graduates of a particular school. Neither does it apply to any one or another class of knowledge, chemistry, physics, drug history, galenical pharmacy, all are very nearly alike in the neglect they suffer. There is a difference, however, in favor of physics and physical characteristics—the more commonplace are, oddly enough, most frequently overlooked. It is very hard for the average dispenser to learn to take advantage of the peculiar physical characteristics of medicinal substances. Many can glibly recite these characteristics, but few can evaluate their helpfulness, or the contrary. Often it is the very slight difference that must be remembered and utilized. The *physical* difference, for instance, between an alkaloid and the salt of an alkaloid; chemical differences, are, always, much more apparent. The physical differences of the three great classes of oils,—formidable stumbling block to the thoughtless, but a world of helpfulness to the thinker.

But these more subtle physical differences are not the only ones that are undervalued; the difference in dispensing between a lighter or a heavier substance, between a gummy and a friable drug, between a smooth, caking powder and one that rapidly separates into individual particles, between hard-grinding chemicals and those that are slippery and soft. So many, young and old, with whom I come in contact, still strive and struggle, yet fail to learn, when to properly use light magnesium oxide and when the heavy. Others will never really learn to know why milk sugar is better than powdered talcum for making a dilution of an active alkaloid, or why licorice root is a better absorbent than starch.

You and I may know the solubilities of many drugs, their specific gravity and their volatile or non-volatile tendencies, but how many of us have learned and know the *mechanical* possibilities of different drugs. I would be surprised if some are not quietly asking, "What does he mean by mechanical possibilities, in this connection?" I can assure you if the meaning is not quite clear, then you have not yet learned to advantageously use those possibilities. The dispenser must learn to use medicinal substances, some of them, as veritable tools, with which to do things, with other substances; they are just as much tools as are mill stones, files, planes and scissors; some of them are used for precisely the same purposes, in principle. A fair appreciation of the mechanical abilities of drugs, together with experience, good judgment, and even, a moderate sense of proportion and its value make almost the "IT" of dispensing.

Proportion in dispensing, I fear, is a term almost as new as "mechanical possibilities." It is, of course, a very general term, but want of consideration for it, is the cause of many, very many dispensing shortcomings. Nothing in dispensing technique seems more difficult to acquire than a sense of proportion. To so many, a particular manipulation is always the same, both in extent and force; it is made to fit all quantities and all characters of substances; it is subject to no

modification. Proportion applies to the quantities or to the measurements of things as they exist or as they may be made to exist. Whether a plan, a process, a force or a substance is used, in proper proportion or not, in dispensing, makes a world of difference. It is a law that controls many important dispensing manipulations and should be carefully studied, however much time it may require to master; it is knowledge that is not acquired so well by practice as by sound reasoning. Sense of proportion is entirely wanting when a dispenser throws a grain of strychnine sulphate in a mortar already containing a dram of quinine sulphate and proceeds to mix them. It is also lacking when he proceeds to make an ordinary solution of potassium bromide in the same manner he would make the usual solution of potassium chlorate. No matter what the relative bulk of the several ingredients may be, if they weigh the same, they are "coons" and all look alike to him. The preparation of an ounce of ointment to contain two percent of yellow mercuric oxide, would be prepared with the same regard for proportion, that he would prepare an equal quantity of an ointment to contain twenty percent of zinc oxide; morphine sulphate is dissolved in much the same manner as Epsom salt.

This law of proportion applies with particular force to the size and uniformity, essential and attractive uniformity, of pills, lozenges, tablets, suppositories and so forth; to the size of powder papers and their relation to powder boxes, and especially to containers. Oh! what dispensing sins are committed by using containers out of proportion to their specific purposes. In labelling, proportion must be very difficult to follow because it is so seldom shown; in the one item of spacing the writing on labels, its absence is more pronounced than any where else. I would feel that I had, by no means, lived in vain, if I could be assured that I had communicated to coming generations of pharmacists, to even a small degree, a better and more helpful appreciation of proportion in its relations to containers, labels and label writing. I am confident I would have added years to my life and much to my fortune, could I have always secured regard for proportion, in my employees.

True esthetics in pharmacy is a thing I have been harping upon for many years, not from a sentimental standpoint, but because I early learned that pharmacy and pharmacists were very "short" on the esthetic and because I had observed that those in other vocations who were "long" on it, were almost invariably successful and, if a personal reference can be excused, I will most positively affirm, with more than forty years of business life behind me, that this fortunate early realization has been my most profitable asset. But it is very difficult to acquire these true esthetic abilities and quite as difficult to apply them to all phases of dispensing. I confess to have made small progress, but the few forward steps I have taken have brought me to interest, to comfort, and I believe and hope, to the holding of much of the public's respect. This is written as the shadows lengthen and not with the slightest tincture of vanity, but simply as encouragement to those who may follow. Others may enjoy a contemplation of the truly beautiful much more intensely than do I, and I am heartily glad if they do, for I am sure they possess a thrilling pleasure that is beyond expression.

The *cause and effect* in dispensing is very difficult to learn. This will bring a smile, I am confident, to the lips of many very learned, so called pharmacists, who are not dispensers and who have had no actual experience with dispensers in

business. It is a person who has seen would-be dispensers, time after time and generation after generation, miscut pills, who realizes that the irregularity follows a want of appreciation of so general a principle as cause and effect. There are thousands and thousands of pharmacists today, with a normal temperature of 98.2° F., who cannot make a presentable cacao-butter suppository by hand, and there are just as many other pharmacists who are living with their blood at exactly the same temperature, who can and do make such suppositories very quickly and successfully. One class cannot be made to understand that the effect of holding the solidified fat between their fingers is to fuse it. Has any one, here, ever closely watched thirty-five or forty different persons fill gelatin capsules with sodium salicylate; the capsules out of the one original container, with identically the same salt, at the same time, in the same atmosphere, at an equal temperature, and notice the results? These results are always exactly consistent with the operator's appreciation of cause and effect.

A dispenser will scarcely presume to call himself accomplished who cannot fold any number of powders of exactly the same size and of a size that will properly fit a box with no other appliance than a spatula and without the aid of the box. Did you ever notice how many give their powders a "twist"; that is fold the ends on different planes? You may tell such dispensers over and over again how this effect is produced, but they will never correct the defect, until they learn themselves to connect the cause with the effect.

This more fundamental consideration of the difficulties of dispensing is nowhere so fruitful in results as in the generally thought, very simple matter of wrapping packages. The bad effects here, from certain very definite causes, are most pronounced. If there is one thing in the art of dispensing that can be reduced to an exact science, it is the wrapping of packages, with results that are not only esthetic, but such as make the very best advertisement. The proof that package wrapping is difficult to learn is strongly presented in the packages that go out of our stores. The cause of bad wrapping is generally too much paper and the absence of a few essential movements of the fingers; the effect is a waste of material and an unattractive, confidence-destroying package.

I trust this broader treatment of the subject, broader than I first intended, has added interest to quite prosaic matters. If to any one, it is not yet quite apparent, what, in my opinion, are some of the most difficult things to learn in dispensing, then to them, I would say: to make "round" pills round and "white" pills white, and the pills of the same lot of exactly equal size; to wrap powders tight, uniform and alike, to mold suppositories easily, without the possibility of mishap or to form them quickly by hand in cold weather or hot; to fill capsules *full*, dry or mass, with the medicament on the inside, only, and the outside clean and bright; to select appropriate containers and label them sensibly, fulfilling the real object of labeling, yet, withal, attractively and finally, to send out packages that look like they came from the hands of a pharmacist, who had been properly trained and not from a hardware store or grocery.

After all, I suppose, the most difficult thing to learn in dispensing is to learn, to really learn, how to dispense.

PRACTICAL PHARMACY AND SYSTEM IN THE PRESCRIPTION
DEPARTMENT.

H. G. POSEY, NEW ORLEANS, LA.

Your chairman has with mistaken zeal insisted upon my writing for you a paper on Practical Pharmacy and Dispensing, to be read before the next meeting of that section. I am fully aware of my limitations, but nevertheless there are a few ideas and wrinkles which occur to us all at times and which would be of appreciable benefit were they called to the attention of probable users, and I shall jot them down here.

The writer was actively engaged in prescription and laboratory work for some years, and although now one of that great army of travelling representatives who call upon the drug trade, still maintains a very lively interest in the back portion of the drug store, the place where the mortars and graduates and the pots and pans are used. Practical pharmacy in its truest sense, comprises both preparing and dispensing the various galenicals and other complex substances which enter into the dispensing or prescription work of the drug store. Such being the case, the writer has been shocked to see the tendency of the pharmacist to *buy everything*, and to be content to pour out of the manufacturer's bottle or package into his own, write out the physician's directions, slap on the label, and let it go at that. Practical pharmacy, I take it, necessitates a clean and orderly prescription counter, and scales. Shades of our ancestors! when I think of the condition of some of the prescription scales I have seen I throw up my hands in horror! Dirt incrustated scale pans, small amounts of powdered and crystalline chemicals which have spilled onto the glass portion of a torsion or a Troemner balance and left to remain there until by its hygroscopic nature it had corroded the metal parts and incrustated both the metal and the glass, rendering the balances sensitive to anywhere from one to five grains instead of one-sixty-fourth or one one-hundredth of a grain as they properly should be. Coupled with that, a dirty disorderly arrangements of the stock bottles and a heterogenous collection of graduates, etc., seems to be the condition existing in too many of our stores. How delightful on the other hand to go behind the prescription counter of a store where all is order and system, and where cleanliness is paramount. That fellow is usually the one who is able to compound that batch of difficult pills or suppositories and do it right. In the routine of the busy prescription store a full line of working solutions of the various salts, acids, etc., is always a great help, and such solutions as potassium iodide, potassium bromide, sodium bromide, sodium salicylate of definite strength, boric acid, citric acid, tartaric acid, and others of their class, also a solution of strychnine sulphate, 1 in 60, all of which remain stable for a time if a small quantity of alcohol be added thereto when making up to the required volume. Such solutions can be measured with greater ease and more expeditiously than the corresponding substance can be weighed, made into solution in the vehicle and strained through cotton or filtered; and let me say right here that

had I a man in my employ who sent out a murky liquid when it should have been clear, I would fire him at once.

Practical pharmacy goes still further than the prescription department. How many so called practical pharmacists have we who would make a botch of Fowler's Solution by putting the arsenic trioxide and potassium bicarbonate in a porcelain evaporating dish, adding the water, and then applying heat. What is the result? In the ebullition caused by the heat the bubbles are forced to the surface and bursting there carry a part of the arsenic with them to the rim and over the rim of the dish. If you doubt, it, get your old tripod, scrape some of the incrustation from its rings and apply any arsenic test; or better still, when you have finished your lot of Fowler's Solution assay it for its arsenical content. I am satisfied that you will in the future use a Florence flask. How many of you in making a U. S. P. tincture of an alkaloidal drug, mydriatic or otherwise, know that the drug is thoroughly exhausted before percolation is finished. Do you just rely upon the absence of chlorophyll, or coloring matter in the last few cubic centimeters of the percolate, or do you subject it to the action of say Mayers reagent?

In handling a prescription containing a large quantity of a glycerophosphate, for instance, which was intended to be in solution, have you ever tried the efficacy of a small quantity of lactic acid?

In making solution of lead subacetate U. S. P. have those of you who have an open steam pipe handy, ever tried coupling a hose on that steam pipe putting the lead oxide, lead acetate and water all together in a stone crock, sticking that hose down into it, turning on the steam and letting the good work go on by itself?

Have any of you ever had to make large quantities of a phosphorous rat and roach paste? No? Well if you ever do, try it this way: Get an ice cream freezer, place the phosphorous in the freezer can, with water enough to cover it. Put it on a water bath until the phosphorous melts, then put in the dasher, pour in fifty percent of the total volume of glucose (syrupy) turn the crank until it is thoroughly mixed, after which add enough previously made flour paste to make up the required volume, then add oil of anise or any other odor desired. That is practical pharmacy from the manufacturing standpoint and just as much practical pharmacy is needed there as behind the prescription counter.

In making large quantities of Aromatic Elixir, U. S. P. have you had trouble in filtering the finished product? Of course you have. Try dissolving the oils or aromatic spirit in part of the alcohol triturating that with talcum in a large mortar, or other vessel, then adding the balance of the alcohol and water, filtering, and adding the syrup last. Have you ever made Compound Resorcin Ointment? Certainly you have, but did you ever try using anhydrous wool fat, dissolving the resorcin in the necessary quantity of water and doing your own hydrating, instead of having the manufacturer to do it for you, and at the same time getting in the resorcin? Try it once. All these things are practical pharmacy and go a very long way toward determining whether or not a man has the ability to make a success in pharmacy.

Papers Presented at the Sixty-First Annual Convention

A BRIEF HISTORY OF THE MAINE PHARMACEUTICAL ASSOCIATION.

A. G. SCHLOTTERBECK.

The formation of the Maine Pharmaceutical Association was the result of a friendly call from H. T. Cummings at the store of the writer during the month of June, 1867.

The conversation naturally drifted to Pharmacy, its various aspects and conditions, in the State of Maine, and how to elevate it. Various plans to improve the status were considered, culminating in the opinion that a school or college of pharmacy ought to be established to teach the several branches of Chemistry, Materia Medica, Botany and Pharmacy, providing sufficient support could be obtained to make it a success.

With this end in view a circular letter was issued inviting the apothecaries of Maine to attend a convention to be held in Portland, July 23, 1867, to deliberate upon the subject, to which the following responded by their presence:

John G. Cook of Lewiston.
Samuel Anderson of Bath.
Charles K. Partridge of Augusta.
Alden F. Keene of Gorham.
Emmons Chapman of Portland.
Harry T. Cummings, of Portland.

Charles H. Marks of Portland.
H. H. Hay of Portland.
J. H. J. Thayer of Portland.
M. S. Whittier of Portland.
William E. Short of Portland.
A. G. Schlotterbeck of Portland.

All of whom have passed away except the writer.

The assembly was called to order by H. T. Cummings, who stated the subject matter for consideration; a temporary organization was formed with Mr. Cummings as Chairman and Mr. Partridge, Secretary. Upon motion it was voted to form a State Pharmaceutical Association. After discussion of various questions adjournment was made to 2:30. The convention having reassembled, the temporary organization, so far as made, was declared to be the permanent organization to be known by the title of the Maine Pharmaceutical Association.

The following were chosen to complete the list of officers: for

Vice-President—J. G. Cook.

Treasurer—M. S. Whittier.

Corresponding Secretary—A. G. Schlotterbeck.

Executive Committee—H. T. Cummings, H. H. Hay, J. H. J. Thayer, all of whom were elected.

Cummings and Schlotterbeck were appointed to draft and report a constitution and by-laws at the adjourned meeting to be held August 20, 1867.

Thus was formed the *first State Pharmaceutical Association* in the United States.

On August 20, the Committee on Constitution, etc., reported as follows:

Preamble: Whereas, the advancement of Pharmaceutical knowledge and the elevation of the professional character of apothecaries and druggists throughout the State of Maine are dear to us in common with all well-disposed pharmacists

And whereas, a large portion of those in whose hands the practice of pharmacy now exists are not properly qualified for the responsible office it involves, chiefly by the many difficulties that impede the acquirement of a correct knowledge of their business

Therefore, We, the members of a convention now assembled at Portland, Me., July 23, 1867, composed of apothecaries and druggists from different sections of the State of Maine with the object of deliberating on the condition of our profession, do hereby resolve and constitute ourselves into a permanent association to meet annually at such time and places as may hereafter be determined, for more effectually accomplishing the objects for which we are now assembled, and do now adopt the following

CONSTITUTION AND BY-LAWS.

This Association shall be called the Maine Pharmaceutical Association. Its aim shall be to unite the educated and reputable Pharmacists and Druggists of Maine in the following objects (the most salient points being):

To improve and regulate the Drug Market of this State.

To prevent the importation of inferior, deteriorated and adulterated drugs and detecting and exposing home adulteration.

To improve the science and art of Pharmacy.

To regulate the system of apprenticeship.

To suppress Empiricism and as much as possible to restrict the sale of medicines to regularly educated druggists and apothecaries.

The report was accepted and adopted for the government of the Association. The third Tuesday of July of each year was chosen for the annual meeting.

On July 21, 1868, the President reported the act of incorporation as follows:

CHAPTER 513.

An act to Incorporate the Maine Pharmaceutical Association.

CHARTER.

Be it enacted by the Senate and House of Representatives in Legislature Assembled, as follows:

Sect. 1. Henry T. Cummings, John G. Cook, Charles K. Partridge, Moses S. Whittier, Augustus G. Schlotterbeck, Samuel Anderson, Jr., Henry H. Hay and J. H. J. Thayer, and all such persons as are now members of an association known as the Maine Pharmaceutical Association, or shall hereafter become members of the same, are hereby constituted a body politic in law and in fact, to have continuance for twenty-five years, by the name of the Maine Pharmaceutical Association, for the purpose of cultivating, improving, and making known the principles of pharmacy, its collateral branches of science, and the best modes of preparing medicines and their compounds, and of giving instruction in the same, by public lectures or otherwise, as circumstances shall render advisable; and may hold real and personal estate to an amount not exceeding twenty thousand dollars.

Sect. 2. The said association may establish by-laws and rules for its government and regulation, and for the preservation and application of the funds thereof, not repugnant to the constitution and laws of the United States, or of the State of Maine; and shall have power to do all and singular acts as may be proper and necessary for the establishment of said association, and for the promotion and fulfilment of its objects.

Sect. 3. The officers of the association shall be a president, vice-president, recording secretary, corresponding secretary, treasurer and auditor, whose respective duties may be assigned by the by-laws, and who shall be elected by printed or written ballots at the stated

annual meeting on the third Tuesday of July of each year, and any vacancy may be filled by a special election by the members of said association. There shall also be elected at said annual meeting an executive committee of six members, who, with the other officers of the association above enumerated, shall constitute a board of trustees, and whose duties shall be defined by the by-laws, and who shall serve one year or until others are chosen to fill their place. Said board, of which not less than five shall constitute a quorum, shall conduct the ordinary affairs of the association. They may make such rules and regulations, and do such other things for the support and government of the Pharmaceutical Association as they may deem fit and proper, and perform such duties as are or may be from time to time committed to them by said association; their acts, however, to be submitted to the association for revision at each stated meeting of the association.

Sect. 4. The board of trustees shall have power to issue certificates of membership, to adopt rules and regulations in the examination of candidates, and the granting of diplomas to those who shall have attended two full courses of lectures, given under the authority of this association, whenever such shall have been established, or shall have passed a satisfactory examination in a course of study prescribed by the board of trustees, and shall have studied not less than four years, with one or more reputable druggist or apothecary, in the theory and practice of the science and art of pharmacy.

Sect. 5. The association may have the right to issue scrip stock, execute bonds, mortgages, conveyances, and to sell its property, whether in real estate, books, productions of nature or art, under the common seal of the association, and acknowledged by its president, or in any way so dispose of its possessions as to promote pharmaceutical education, and the mutual advancement of its members, and the elevation of the art and business of the pharmacist in the community.

Sect. 6. If the annual election for officers of the association and members of the board of trustees for any cause shall not be held on the day before mentioned, the said corporation shall not be thereby dissolved, but the officers and trustees shall continue in office until a new election.

Sect. 7. The corporation hereby created shall be subject to the provisions and possess the general powers specified in reference to kindred and educational societies in the revised statutes of the state of Maine; and the legislature may at any time modify, alter or repeal this act.

Approved February 17, 1868.

It was also voted to hold a semi-annual meeting on the third Tuesday of January each year.

January 19, 1869, the Legislative Committee reported that the petition to the Legislature for apothecaries to be authorized to dispense liquors on physicians' prescription was killed by politicians, leaving matters in the same humiliating and derogatory condition—the apothecary being stigmatized as a rumseller (which in many cases, the writer confesses was true). The public, however, demanded and expected that the apothecary should supply the “ardent” if wanted, notwithstanding that by doing so he was obliged to violate the law and subject himself to the penalties thereof.

The annual meeting of 1869 adjourned without any special business. The Association did not meet again until 1870, when a committee was appointed to consult with the professors of the Boston College of Pharmacy in regard to making arrangements for their delivering a course of lectures in Portland.

On July 16, 1872, the old officers, who had served from the beginning, were again elected and adjournment was made to the third Tuesday of October, which was also selected for the future annuals. A vote to again petition the Legislature to enact the Pharmacy Law, which was indefinitely postponed in 1871; was passed.

OFFICERS OF THE MAINE PHARMACEUTICAL ASSOCIATION FROM 1867 TO 1913.

October 20, 1872. Meeting held in Augusta—Officers re-elected—Committee appointed to confer with a similar committee from the Maine Medical Association to have a law enacted requiring physicians and apothecaries to pass an examination before entering upon either profession.

October 17, 1876. The Committee on Legislation was instructed to procure an amendment to the pharmacy bill pending so its provisions for registration and examination shall be mandatory only in their application to towns and cities of not less than two thousand (2,000) population.

A midsummer session for business and social purposes was suggested and adopted.

The Legislature during the winter enacted the first pharmacy law which was as follows:

Chapter 204.

An act to prevent incompetent persons from conducting the business of Apothecaries.

PHARMACY LAW,

Be it enacted by the Senate and House of Representatives in legislature assembled, as follows:

Sect. 1. The governor, with the advice of the council, shall appoint three suitable persons to be commissioners of pharmacy, one of whom shall hold his office for three years, and each until his successor shall be appointed and qualified; and each year thereafter another commissioner shall be so appointed and qualified. If a vacancy occurs in said commission, another shall be appointed, as aforesaid, to fill the unexpired term thereof. Before entering upon the duties of their office, the commissioners shall be sworn to faithfully and impartially discharge the same, and a record thereof shall be made on their commissions.

Sect. 2. Said commissioners shall examine any person who hereafter desires to engage in the business of an apothecary, and if found skilled in pharmacy, shall give him a certificate of that fact, and that he is authorized to engage in the business of an apothecary, and such certificate must be signed by at least two commissioners. They shall register in a suitable book, to be kept in the secretary of state's office, the names and places of residence of all persons to whom they issue certificates, and the dates thereof, and for each certificate of registration given under the provisions of this act, said commissioners shall be entitled to receive from the applicant five dollars, which shall be in full for all services and expenses.

Sect. 3. Every person hereafter entering upon the business of an apothecary shall first be examined by said commissioners, and present to them satisfactory evidence that he has been an apprentice or employed in an apothecary store where physicians' prescriptions are compounded, at least three years, or has graduated from some regularly established medical school, or college of pharmacy, and is competent for the business, and the commissioners may then grant him a certificate and registry as hereinbefore provided.

Sect. 4. Any person engaged in the business of apothecary at the passage of this act may receive a certificate and be registered as aforesaid, on application to said commissioners, and presenting to them satisfactory evidence of his competency therefor.

Sect. 5. Apothecaries registered as herein provided, shall have the right to keep, under such restrictions as the legislature may impose, all medicines and poisons authorized by the United States dispensatory and pharmacopœia as of recognized medicinal utility; *provided*, that nothing herein contained shall be so construed as to authorize the sale of intoxicating liquors.

Sect. 6. If any person shall hereafter engage in the business of an apothecary, who is not now in said business, contrary to the provisions of this act, he shall be subject to a penalty of fifty dollars for each week he shall so continue in such business, to be recovered by an action of debt for the use of any person suing therefor, or by indictment for the use of the county.

Sect. 7. This act shall not apply to physicians putting up their own prescriptions, or to the sale of proprietary medicines.

Approved February 9, 1877.

The provision in regard to registration being misconstrued by some created an active acrimonious opposition against those who had strenuously exerted themselves to obtain the law, nearly disrupting the State Association.

July 16, 1877. The announcement that the business session would be followed next day by a sail down the bay and a clam bake added fifty-four new members.

October 16, 1877. Annual Meeting. Thirty-one were added to roll of membership and though the old officers were re-elected, the control of the Association was to pass into new hands—at the next annual meeting.

July 24, 1878. An entirely new list of officers was elected. The year proved uneventful. The records do not show that the Association was ever presided over by the President-elect.

September 18, 1879. Mr. Dana was elected President. His administration proved unfortunate as the Association passed into a dormant state remaining in same eleven years, during which time no meetings were held, until its revival July 17, 1890, by the re-election of Chas. K. Partridge as President, with a full line of officers. By 1895, the Association seems to have begun to realize and fulfill its mission. The standard of examination had been raised by the Pharmacy Commission. Four papers were contributed and read in the annual meeting, competing for the prize; this was won by W. A. Robinson, subject, "The Apothecary of 1860 versus 1895." All reference to the prohibitory law was ignored.

July, 1896. Dr. M. L. Porter, of Danforth, was elected Secretary, proving such a host in himself that he has been retained in that position ever since. To him is due the greater part of the success achieved by the Association of late.

The Commissioners of Pharmacy were appointed a Sub-Committee on Legislation and obtained the enactment of the Pharmacy Law of 1897.

1898. A new constitution and by-laws were adopted.

1899. The Pharmacy Department of the Maine State University was highly commended by the President in his annual address and has since been endorsed by the Association.

1900. Resolutions were adopted as to the status of the pharmacist in the Army and Navy with petition forwarded for his betterment to the President and Secretary of Army and Navy.

Since the passage of the Pharmacy Law of Maine to the present time, 1913, the following gentlemen have served as Commissioners of Pharmacy for varied periods:

N. S. Harlow
Chas. K. Partridge
H. T. Cummings
J. H. Plaisted
A. G. Schlotterbeck
John H. Hammond
W. H. Jordan
Seth D. Wakefield
Herschel Boynton
J. Q. A. Hawes
Frank R. Partridge

Edward H. Thompson
Noble C. Earle
Percy L. Lord
D. W. Heseltine
Jos. F. Young
Fred H. Wilson
Chas. H. Davis
Frank W. Bucknam
Frank F. Cram
Jas. A. Broe
Ernest L. Cowan

The new Constitution and By-Laws adopted in 1898 are as follows:

THE CONSTITUTION.

Article I.

This Association shall be called the Maine Pharmaceutical Association.

Article II.

The object of this Association shall be to promote the interest of pharmacy by urging the enactment of such laws as will be of mutual advantage to pharmacists and the public, restricting to competent persons the dispensing and sale of medicines, to encourage a more thorough training of assistants, and to bring the pharmacists of this State into more intimate social relations.

Article III.

Section 1. This Association shall consist of active, associate and honorary members.

Section 2. Active members shall consist of legally registered apothecaries of the State, of good moral character and professional standing, whether in business for himself, retired from business or employed by another in a store where drugs and medicines are legally dispensed.

Section 3. Associate members shall consist of persons of good moral character and professional standing who are in business for themselves or employed by another in a store where drugs and medicines are legally dispensed. Commercial travelers who are employed by wholesale druggists, manufacturing chemists, and druggists' sundry houses, actively engaged in soliciting business from the drug trade in the State, are eligible as associate members.

Section 4. Pharmacists, chemists and other scientific men who may be thought worthy the distinction, may be elected honorary members. They will not, however, be expected to pay any dues. Active members only shall be eligible to vote for candidate for Commission of Pharmacy.

Article IV.

The officers shall consist of a president, three vice-presidents, a secretary, an assistant or local secretary (to be elected from the place of the next meeting) and a treasurer, all of whom shall be elected annually, and shall hold office until the election of their successors.

The executive committee shall consist of the president, vice-presidents, secretary and two members to be appointed by the president.

The auditing committee shall consist of the three vice-presidents, who shall examine the accounts of the secretary and treasurer and report at the annual meeting.

Article V.

Section 1. The president, or in his absence or inability to serve, the vice-presidents in their order, shall preside at all meetings of the Association, and administer the rules of order usual in deliberative assemblies, shall call special meetings at the written request of fifteen members, shall present at each annual meeting a report of the affairs of the Association for the past year, together with such suggestions for its future management as may seem to him proper. He shall sign all certificates of membership, and countersign all orders on the treasurer.

He shall approve the bonds of the secretary and treasurer, and keep the same in his custody.

Section 2. The secretary shall collect all moneys due the Association from dues and other sources, paying the same to the treasurer once at least every three months and with the aid of the local secretary keep a faithful record of the proceedings of the Association, and carefully preserve on file all reports, essays and papers of every description received by the Association. He shall keep a roll of the names of the members and their residences, conduct all correspondence of the Association, notify all members four weeks in advance of each annual meeting, notify all members of committees of their appointment and election, and furnish each member of the committee with the names of their associates, and in con-

junction with the executive committee, superintend such publications as the Association may direct, and at each annual meeting render a report of the duties performed by him since the last annual meeting with a report of his accounts, and the names of such members as have not paid their dues for three successive years. He shall receive a salary of one hundred dollars per year.

He shall file a bond in the sum of one thousand dollars, the expense of which shall be paid by the Association. He shall sign all certificates of membership, and draw all orders on the treasurer to be countersigned by the president.

Section 3. The treasurer shall receive all moneys from the Secretary and faithfully care for the same. He shall pay all bills for the Association only upon orders drawn by the secretary and countersigned by the president.

He shall present a report of his accounts at each annual meeting.

He shall receive as salary the sum of fifteen dollars per year. He shall give a bond in the sum of one thousand dollars, the expense of which shall be paid by the Association.

Section 4. The executive committee shall have full power to act for and have general charge of the affairs of the Association, providing that the action of such committee shall not contravene instructions of the Association.

Section 5. This Association may establish for its future government and regulation, such by-laws not in conflict with this constitution as may be deemed proper and advisable.

Section 6. The annual meeting of this Association shall be held at such date and place as the Association shall direct.

Section 7. Every proposition to alter or amend this constitution shall be submitted in writing and received at an annual meeting and may be voted for at the next annual meeting, when, upon receiving the votes of three-fourths of the members present and entitled to vote, it shall become a part of this constitution.

BY-LAWS.

Article I.

Fifteen members shall constitute a quorum for the transaction of business at all meetings.

Article II.

The names of persons applying for membership, with their residences, shall be presented in writing, recommended by two members in good standing and referred to the executive committee, and if reported favorable, the candidates may be balloted for, and if they receive two-thirds of the votes cast, shall be declared elected.

Article III.

The membership fee shall be two dollars, which shall include the dues for the current year, which amount shall accompany the application and be paid to the secretary.

Article IV.

Every member shall pay annually in advance into the hands of the Secretary the sum of two dollars. Any member in arrears at the annual meeting shall not be entitled to vote, and if three years in arrears shall lose his membership.

Article V.

Section 1. The President shall, before the close of each annual meeting, appoint the following committees (of which he shall be a member ex-officio), each to consist of three members, viz.: Committee on the drug market and trade interests; committee on pharmacy; committee on legislation and committee on papers.

Section 2. The committee on the drug market and trade interests shall report at each annual meeting such observations and information on these subjects as may seem to them of interest to the Association.

Section 3. The committee on pharmacy shall report annually respecting the scientific progress, discoveries and investigation during the year.

Section 4. The committee on legislation shall compile for reference the laws of the dif-

ferent states regulating the practice of pharmacy and the sale of medicines, and report at each annual meeting what important changes, if any, have occurred during the year, and what additional legislation shall be desirable in this State.

Section 5. The committee on papers shall invite members and others, as they deem proper to prepare and present papers on subjects of interest to the profession, and shall have general management of any prize offered by the Association.

Section 6. Special committees may be appointed as occasion requires, but such committees shall be limited to the scope of the resolution under which they act.

Article VI.

This Association shall annually elect five delegates to the American Pharmaceutical Association, and they shall present their report at the next annual meeting of this Association. Delegates to other Pharmaceutical Associations shall be appointed by the President.

Article VII.

Any amendment to these by-laws must be made in writing, read before the Association at one sitting and laid over to a subsequent sitting, when upon receiving the votes of two-thirds of the members present, it shall become a part of these by-laws.

FEE-SPLITTING.

This is a practice which leads to several indictments. It induces family physicians to betray the sacred confidences of their trusting patients and refer them not to those men who are most competent and who offer the greatest possibility of the saving of life and the preservation of health, but to men who pay for the victim. It lowers the dignity and value of the services of the family physician, who is presumably rendering valued services for nothing, and gives a magnified value to surgery, which is presumably receiving all. How much more exalted would be the standing of the general practitioner if people were taught to value his services in diagnosis and his responsibility in counseling surgery and recommending a surgeon and that they should pay for this service as they would for any other. It should be the privilege of the surgeon to aid the physician openly to secure this just compensation. As a rule the patient is robbed, paying two fees instead of one, as he supposes. Fee-splitting is the stepping-stone by which incompetent men secure business. It penalizes honesty in the young surgeon who is capable but must sit idly by and starve while his less competent competitor buys the business. It leads to many unnecessary operations with their attendant risk and expense performed merely because the patient can be induced to submit and has the price. It is a betrayal of trust, encourages dishonesty, breeds incompetency and should in short, be held a crime. Dr. Jabez N. Jackson, Kansas City, Mo., before the Western Surgical Association, St. Louis, Dec. 19, 1913.—*Journ. Am. Med. Assn.*

UNITED STATES PHARMACOPŒIA.

NINTH REVISION.

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS.

Copyright, 1914, by the Board of Trustees of the United States Pharmacopœial Convention.*
All Rights Reserved

PART II—FIRST PROOF.

A second installment of the abstract of proposed new descriptions and standards, and of changes in descriptions and standards is herewith submitted.

This abstract embraces most of the drugs of vegetable and animal origin. Many descriptions have been amplified or added and it has been found necessary to present these in full.

Where no reference is made to definitions and descriptions it is understood that the material facts remain the same as in the United States Pharmacopœia, Eighth Revision.

Other abstracts will be submitted later. Comments should be sent to the Chairman of the Revision Committee, Joseph P. Remington, 1832 Pine street, Philadelphia, before May 1, 1914.

Acacia.—The air-dried gummy exudation of *Acacia Senegal Willdenow*, and other African species of *Acacia*. In ovoid, more or less spheroidal tears or in broken, angular fragments from 2 to 30 mm. in diameter, varying from whitish, yellowish-white to light amber-colored. Slowly and almost completely soluble in twice its weight of water, the solution having a slight, characteristic odor. The requirement that it should not reduce alkaline cupric tartrate V. S. is omitted. Powder: Not more than 1 percent. should be insoluble in water (limit of plant tissues, sand, and dirt). The powder should contain not more than 15 percent. of moisture.

Aconitum.—Not more than 5 percent. of stem-bases or other foreign matter should be present. More or less conical or fusiform, from 4 to 10 cm. in length, from 1 to 2 cm. in diameter at the crown; externally dark brown or grayish-brown, smooth or longitudinally wrinkled, the upper end with a bud, remains of bud-scales or stem-scars, the other portions with numerous root-scars or short rootlets; fracture short, horny or somewhat mealy; internally, bark light or dark brown, 1 to 2 mm. in thickness, cambium zone usually 5- to 8-angled, with a small fibro-vascular bundle in each angle, pith whitish or light brown, 2 to 7 mm. in diameter; odor very slight; taste sweetish, soon becoming acrid and developing

*Permission to reprint for purposes of comment can be had on application to the Chairman of the Board of Trustees, J. H. Beal, Scio, Ohio.

a tingling sensation, followed by numbness. Under the microscope transverse sections made near the middle of the tuberous root of Aconite show an epidermis replaced by a layer consisting of one or more rows of cells with blackish-brown walls; a primary cortex of 8 to 15 rows of parenchyma and characteristic stone cells, occurring either singly or in small groups; a more or less modified endodermis; a secondary cortex, consisting chiefly of starch-bearing parenchyma and interspersed with a few small fibro-vascular bundles; a more or less star-shaped and characteristic cambium with from 5 to 12 collateral fibro-vascular bundles; and a pith composed of large parenchyma cells filled with starch. Powder: Grayish-brown; starch grains numerous, spherical, somewhat plano-convex, single or 2- to 5-compound, the individual grains from 0.003 to 0.015 mm. in diameter and frequently with a central cleft; tracheæ mostly with slit-like, simple pores, sometimes with spiral or reticulate thickenings or with bordered pores; stone cells single, tabular, irregular in shape or elongated to fibers from 0.100 to 0.400 mm. in length, walls from 0.008 to 0.025 mm. in thickness, strongly lignified and having large simple pores; fragments of cork few, yellowish-brown; fragments of parenchyma numerous, the cells being filled with starch grains; bast-fibers from stems few, very long, with lignified walls about 0.005 mm. thick, and marked by transverse or oblique, slit-like pores. Ash not exceeding 6 percent.

Agar-Agar.—The dried mucilaginous substance extracted from *Gracilaria* (*Sphaerococcus*) *lichenoides* Greville and other marine algæ growing along the eastern coast of Asia, particularly several species of *Gelidium* or *Gloiopeltis* (Class Rhodophyceæ. Mostly in bundles from 4 to 6 dm. in length, consisting of thin, translucent, membranous, agglutinated pieces from 4 to 8 mm. in width; externally yellowish-white or brownish-white, shiny; tough when damp, brittle when dry; odor slight; taste mucilaginous. A fragment mounted in water and examined under the microscope gradually becomes more transparent, showing a granular structure and a few diatoms, notably the frustules of *Arachnoidiscus Ehrenbergii* Baillon, which are disk-shaped, from 0.100 to 0.200 mm. in diameter, and also fragments of the spiculæ of sponges; upon the addition of iodine some of the granules or hyphal-like portions are colored bluish-black. Insoluble in cold water, slowly soluble in hot water. A solution made by boiling 0.100 Gm. of Agar-agar in 100 Cc. of water, upon cooling, should yield no precipitate upon the addition of tannic acid T. S. (gelatin) and should not produce a blue color upon the addition of iodine T. S. (starch). One part of Agar-agar boiled for about ten minutes with 100 parts of water, and replacing the water lost by evaporation, should yield a stiff jelly upon cooling. Powder: Pale buff; when mounted in water and examined under the microscope it shows transparent, more or less granular, striated angular fragments. In some mounts occasional frustules of diatoms are present; with iodine T. S., fragments for the most part are colored bright red, certain more or less definite areas being stained bluish-black. Ash not exceeding 5 percent.

Aloe.—Definition: The inspissated juice of the leaves of *Aloe Perryi* Baker, yielding Socotrine Aloes; or *Aloe vera* (Linné) Webb, yielding Curaçao Aloes; or of *Aloe ferox* Miller, yielding Cape Aloes (Fam. Liliaceæ). Socotrine Aloes: In yellowish-brown to blackish-brown, opaque, or smooth and glassy masses; fractured surface somewhat conchoidal; sometimes soft or semi-liquid;

odor aromatic or saffron-like, never fetid or putrid; taste nauseous, bitter. Not less than 50 percent. of Socotrine Aloes should be soluble in cold water, the solution being of a yellowish color. Powder: Very dark brown; when mounted in one of the fixed oils and examined under the microscope it shows yellowish or reddish-brown, irregular, or angular fragments. Upon the addition of nitric acid, it yields a yellowish or reddish-brown solution. Curaçao Aloes: In orange to blackish-brown, opaque masses; fractured surface uneven, waxy, somewhat resinous; odor characteristic but not aromatic as in Socotrine Aloes. Not less than 60 percent. of Curaçao Aloes should be soluble in cold water, the solution being of a purplish-red color. Powder: Deep reddish-brown; when mounted in one of the fixed oils, and examined under the microscope it shows numerous blackish-brown or reddish-brown, irregular angular, more or less opaque fragments. Upon the addition of nitric acid it yields immediately a deep red solution. Cape Aloes: In reddish-brown or olive-black masses, usually covered with a yellowish powder; in thin, transparent fragments, of a reddish-brown color; fracture smooth and glassy; odor characteristic. Not less than 60 percent. of Cape Aloes is soluble in cold water, the solution being of a pale yellow color. Powder: Greenish-yellow changing to light brown on aging; when mounted in one of the fixed oils and examined under the microscope it shows numerous, distinctly angular, bright yellow fragments. Upon the addition of nitric acid it yields a solution that is colored reddish-brown, changing to purplish-brown and finally greenish. The tests which follow apply to Socotrine, Curaçao and Cape Aloes: Aloes should contain not more than 10 percent. of moisture. If to 1 Gm. of Aloes 50 Cc. of alcohol be added, the mixture first gently heated and then cooled, a nearly clear solution should be obtained (gum and inorganic impurities). Intimately mix 1 Gm. of Aloes with 10 Cc. of hot water and dilute 1 Cc. of this mixture with 100 Cc. of water; a green fluorescence should be produced upon the addition of a 5 percent. solution of sodium borate. Dilute 1 Cc. of the original aqueous mixture of Aloes with 100 Cc. of water, shake it with 10 Cc. of benzene; upon separating the benzene solution and adding to it 5 Cc. of ammonia water, a deep rose color, which is permanent, should be produced in the lower layer. Ash not exceeding 4 percent.

Althæa.—The root of *Althæa officinalis* Linné (Fam. Malvaceæ) deprived of the brown, corky layer and small roots, and carefully dried. Root: Usually cut into small pieces about 5 mm. in diameter, of a uniform grayish-white color and otherwise having the characters of entire roots; occasionally entire, slenderly tapering, attaining a length of 30 cm. and a thickness of 2 cm.; externally whitish, longitudinally furrowed, frequently spirally twisted and covered with the somewhat loosened bast-fibers; fracture of bark fibrous, of wood short and granular; internally yellowish-white, bark from 1 to 2 mm. thick, porous, due to mucilage cells, and separated from the slightly radiating wood by a distinct, grayish, cambium zone; odor slight; taste sweetish, mucilaginous. Powder: Whitish; starch grains, numerous, from 0.005 to 0.020 mm. in diameter, usually with a long cleft at the point of origin of growth; sclerenchymatous fibers in groups, the walls being quite thick and more or less lignified; tracheæ with scalariform thickenings or with bordered pores; calcium oxalate crystals few, in rosette aggregates, 0.020 mm. to 0.030 mm. in diameter. Add 1 Gm. of *Althæa*

Root to 10 Cc. of cold water, allow it to stand with occasional stirring, and filter it through cotton; a pale yellow colored mucilage should be obtained, which should be neutral to litmus, and colored a deep yellow on the addition of a few drops of potassium hydroxide T. S. The mucilage should not have a sour or ammoniacal odor. Ash not exceeding 8 percent.

Amygdala Dulcis.—Powder: Creamy-white, exhibiting numerous very small oil globules, 0.001 mm. or less in diameter, larger oil globules and crystalloids, the latter sometimes with adhering globoids; fragments of parenchyma of endosperm, containing oil globules and aleurone grains; also occasional fragments of seed-coat with characteristic, more or less scattered, large elliptical, thin-walled, strongly lignified epidermal cells and narrow, closely spiral tracheæ. Starch grains are absent. Ash not exceeding 4 percent.

Amylum.—Taste slight, characteristic. Residue on incineration changed from "not more than 1 percent." to "not more than 0.5 percent."

Anisum.—Definition requires the dried ripe fruit with not more than 3 percent. of foreign seeds and other vegetable matter. Fruit: The cremocarp broadly ovoid or pyriform, laterally compressed, 3 to 6 mm. in length, 2 to 3 mm. in breadth; mericarps usually cohering and attached to a slender pedicel 2 to 12 mm. in length, summit with a ring-like disk and 2 projecting, diverging styles; externally grayish or greenish-gray, seldom grayish-brown, slightly pubescent; each with five light brown, filiform ridges and in cross-section with from 15 to 45 vittæ or oil tubes; odor and taste agreeable and aromatic. Under the microscope transverse sections of Anise show an epidermal layer with numerous papillæ and short, one-celled, non-glandular hairs having very thick, papillose walls; primary ribs each with a small, fibro-vascular bundle, surrounded by a few sclerenchymatous fibers; vittæ or oil tubes, 13 to 56 in number, extending as a more or less interrupted circle in the tissues of the mesocarp on the dorsal side of each mericarp; 2 large vittæ on the commissural surface, each separated from the other tissues of the mericarp by a large cavity due to shrinkage of the seed-coat; inner epidermis of pericarp consisting of a layer of narrow tangentially elongated cells closely united with the seed-coat, the inner walls of which are yellowish-brown and considerably thickened; endosperm of polygonal, thick-walled cells, filled with spherical or ellipsoidal aleurone grains, each containing a small rosette aggregate of calcium oxalate; the aleurone grains surrounded with an oily protoplasm, the oil of which is liberated upon mounting sections in hydrated chloral T. S., and appearing in the form of small globules; epidermal layer near the middle of the commissural surface composed of 2 or 3 rows of cells with thick, porous walls, and beneath which occur small groups of thick-walled cells resembling stone cells. Powder: Yellowish-brown, consisting of numerous irregular fragments of pericarp showing portions of the yellowish vittæ, fragments with tracheæ and sclerenchymatous fibers of carpophore; cells of endosperm filled with aleurone grains, 0.006 mm. in diameter, each usually enclosing a rosette aggregate crystal of calcium oxalate 0.002 mm. in diameter; non-glandular hairs 1-celled, from 0.025 to 0.200 mm. in length, either straight or curved and with numerous, slight, centrifugal projections on the outer surface. Ash not exceeding 10 percent.

Apocynum.—The dried rhizome and roots of *Apocynum cannabinum* Linné

(Fam. Apocynaceæ), with not more than 5 percent. of stems and other foreign matter. Cylindrical, somewhat branched, of varying length, from 3 to 10 mm. in thickness; externally reddish-brown to grayish-brown, longitudinally wrinkled and occasionally with transverse fissures, having vertical sides, extending through the bark; fracture short; internally, bark light brown, 1.5 to 3 mm. in thickness, wood faintly radiate and with large tracheæ, a small pith occurring in pieces of the rhizome; almost inodorous, taste starchy, afterwards becoming bitter and somewhat acrid. Under the microscope sections of *Apocynum* show numerous laticiferous vessels in both the bark and pith. Stems of *Apocynum* have a comparatively thin fibrous bark, a light brown porous wood and a large, hollow pith. Powder: Light brown, starch grains numerous, from 0.003 to 0.015 mm. in diameter, spherical, ellipsoidal, ovate, pyriform or more or less irregular, sometimes more or less altered, swollen, and with a hyaline central cleft; numerous fragments of strongly lignified wood-fibers, associated with tracheæ mostly having bordered pores, occasionally with spiral thickenings; fragments of cork layer few, the walls being of a reddish-brown color; an occasional fragment with laticiferous tissues; stone cells few or absent. (*Apocynum androsæmifolium* Linné.)

Arnica.—Florets: Consisting chiefly of the tubular and ligulate flowers, occasionally with the involucre and receptacle present; involucre bracts narrowly lanceolate, about 1 cm. in length, dark green and pubescent; receptacle slightly convex, deeply pitted and densely short-hairy; ray flowers bright yellow, the ligulate portion, 2 cm. in length, more or less folded lengthwise, 3-toothed, 7- to 12-veined, pistillate; tubular flowers perfect, reddish-yellow, stamens without a tail-like appendage (distinguished from anthers in flowers of *Inula* *Helenium* Linné, which have two bristles or long tails at the base); the achenes spindle-shaped, 5 to 7 mm. in length, dark brown, finely striate, glandular-pubescent and surmounted by a pappus a little longer than the achene and composed of a single circle of nearly white barbellate bristles; odor characteristic and agreeable; taste bitter and acrid. Powder: Yellowish-brown, pollen grains numerous, from 0.025 to 0.035 mm. in diameter, spherical, triangular in section and spinose; non-glandular hairs of three kinds, either unicellular, 4- to 6-celled, or consisting of a pair of united unicellular hairs with numerous pores in the dividing wall; glandular hairs of three kinds, either with a large unicellular stalk and a unicellular, glandular head or with a 4-celled stalk and a unicellular glandular head, or a stalk of a double row of 5 cells and a 2-celled glandular head; pappus consisting of a multicellular axis with unicellular branches. Ash not exceeding 9 percent.

Asafætida.—The gum-resin, obtained by incising the rhizomes and roots of *Ferula Asafætida* Linné and *Ferula foetida* Regel and of other species of *Ferula* (Fam. Umbelliferae) indigenous to Persia and adjacent countries, yielding not less than 60 percent. of alcohol-soluble constituents. A soft, putty-like mass, sometimes almost semi-liquid, or in irregular, more or less pliable hard masses composed of agglutinated tears of variable size embedded in a yellowish-brown or dark brown matrix, or in loose, ovoid tears, from 1 to 4 cm. in diameter, the surface being sometimes streaked a violet, yellowish-red or brownish-red and with a few vegetable fragments; when fresh the mass is either soft or tough, becoming hard and occasionally even brittle on drying; the surface of the freshly fractured tears is milky-white and opaque, changing gradually to a

pinkish or reddish-purple or even reddish-brown on exposure; on moistening with water, the tears become milky-white; odor persistent, alliaceous; taste bitter, alliaceous and acid. Triturate one part of Asafetida with three parts of water; it should form a milk-white emulsion which should become yellowish on the addition of alkalis. Heat a fragment of one of the tears of Asafetida with sulphuric acid; a reddish-brown solution should be formed; greatly dilute the latter with water, filter, and add an excess of any of the alkalis, the solution should acquire a blue fluorescence, becoming more pronounced upon the addition of a slight excess of ammonia water. An alcoholic solution of the tears, on the addition of a few drops of phloroglucinol T. S. and a few drops of hydrochloric acid should become of a cherry-red color. Add a few drops of ferric chloride T. S. to a portion of the alcoholic solution of Asafetida, obtained in the assay process given below; an olive-green color should be produced (most foreign resins). Add hydrochloric acid to another portion of the same alcoholic solution until a faint turbidity results; a bluish-green color should be developed, which fades on standing (galbanum). Evaporate enough of the same alcoholic solution, representing 5 Gm. of Asafetida, to 25 Cc., mix it with 25 Cc. of purified petroleum benzin in a separatory funnel and afterwards add twice its volume of water; the mixture and the petroleum benzin layer, after washing with water and subsequent separation, should exhibit no green color when shaken with 30 Cc. of a freshly made aqueous solution of copper acetate (1 in 20) (rosin). Mix 2 Cc. of emulsion of Asafetida with 5 Cc. of water and add 5 Cc. of sodium hypobromite T. S., so as to form a separate layer; a red color should not be produced (ammoniac). Ash of the gum-resin not exceeding 15 percent.. Powder: Powdered Asafetida may be prepared by drying the gum-resin over freshly burnt lime or by exposing it to currents of warm air until it ceases to lose weight, and then reducing it to a powder at a low temperature. Diluents of starch or magnesium carbonate may be added in order to maintain the powdered form. The color of powdered Asafetida is light brown. Not less than 50 percent. should be soluble in alcohol. Ash of the powder not exceeding 30 percent. Assay: Place about 10 Gm. of Asafetida in a tared, 250 Cc. Erlenmeyer flask, determine the exact weight of the drug, add 100 Cc. of alcohol, and, having connected the flask with an upright condenser, boil the mixture in the flask during one hour or until the drug is disintegrated completely. Then transfer the contents of the flask to two counterpoised, plainly folded filters, one within the other, so that the triple fold of the inner filter is laid against the single side of the outer, and wash the flask and filter with consecutive, small portions of boiling alcohol until the washings no longer produce a cloudiness when dropped into water. Collect and reserve the mixed alcoholic solutions and dry the filters and flask to a constant weight at a temperature of about 115° C. Now determine the weight of the residue on the filter and in the flask and calculate its percentage from the amount of Asafetida originally taken. This percentage of alcohol-insoluble material, when subtracted from 100, will give the percentage of alcohol-soluble constituents contained in the Asafetida.

Aspidium.—The “uncomminted rhizome and stipes” should be collected in the autumn, freed from the roots and dead portions of rhizome and stipes and dried at a temperature not exceeding 70° C. Usually with the blackish-brown

outer layers removed; rhizome 1 to 3 cm. in thickness, cylindraceous and nearly straight, or curved and tapering toward one end, usually split longitudinally, roughly scarred with remains of the stipe-bases, or bearing several coarse longitudinal ridges and grooves, stipes cylindrical, 3 to 5 cm. in length, about 6 mm. in thickness, nearly straight, or somewhat curved, tapering toward one end, and with occasional elongated patches of the still-adhering, blackish-brown out-layers; fracture short, pale green in the inner half, the texture rather spongy, and exhibiting in an interrupted circle from 6 to 12 vascular bundles, each surrounded with an endodermis; odor slight; taste sweetish, astringent, bitter and acrid. Ash not exceeding 3 percent.

Aurantii Amari Cortex.—Rind from “unripe” fruit of *Citrus Aurantium amara* Linné. In narrow, thin bands (ribbons), or more often elliptical, flattened, more or less curved pieces (quarters), varying from 3 to 6 cm. in length; outer surface convex; varying from reddish-brown (ribbons) to greenish-brown (quarters), coarsely reticulate and with the edges recurved; inner surface concave, whitish, with numerous conical projections and yellowish-white, linear, more or less anastomosing, fibro-vascular bundles; fracture hard; cross section light brown, somewhat spongy, outer layer with 1 or 2 rows of oil reservoirs; odor fragrant; taste aromatic and bitter. Powder: Yellowish-white or light brown; fragments of parenchyma cells numerous, the walls from 0.004 to 0.012 mm. in thickness; few fragments of tracheæ with close spiral markings or simple pores; occasional membrane crystals of calcium oxalate in monoclinic prisms, from 0.020 to 0.035 mm. in diameter. Powdered Bitter Orange Peel should be colored yellowish upon the addition of potassium hydroxide T. S. Ash not exceeding 7 percent.

Aurantii Dulcis Cortex.—The outer rind of the fresh, ripe fruit of *Citrus Aurantium sinensis* Gallesio (Fam. Rutaceæ). The outer, orange-yellow layer recently separated by grating or paring and consisting of epidermal cells, parenchyma cells of the sarcocarp, with chromoplastids, oil reservoirs and globules of volatile oil; odor highly fragrant; taste pungently aromatic.

Belladonna Folia.—The dried leaves and tops with not more than 10 percent. of stems; usually much twisted and matted together; leaves much crumpled, when soaked in water and spread out, from 6 to 20 cm. in length, 4 to 12 cm. in breadth, broadly ovate, summits acute, margins entire, narrowed into the long petioles; upper surfaces brownish-green; lower surfaces grayish-green, epidermis more or less papillose and slightly hairy; flowers with yellowish-purple, campanulate corollas; fruits globular; fruits dark green or greenish-brown, subtended by a dark green calyx, and with numerous small seeds; odor distinct, heavy, especially on moistening; taste somewhat bitter and acrid. Stems of variable length, not exceeding 7 mm. in diameter, longitudinally wrinkled, older parts smooth and usually hollow, younger parts flattened and finely hairy. Powder: Dark green, consisting of irregular fragments of leaf tissues and woody elements, calcium oxalate in sphenoidal micro-crystals; hairs few, the non-glandular being simple 2- to 5-celled, and the glandular with stalks of 1 to 3 cells; tracheæ with annular, spiral, scalariform or reticulate thickenings and with bordered pores; starch grains and pollen grains few; occasional fragments of the stems of *Belladonna* with long, thin-walled and slightly lignified bast-fibers.

Raphides should not be present (leaves and stems of *Phytolacca decandra* Linné). Ash not exceeding 20 percent.

Belladonna Radix.—The dried root with not more than 10 percent. of its stem-bases; cylindrical or somewhat tapering, usually split into longitudinal pieces, of 0.5 to 2.5 cm. in thickness; externally pale brownish-gray, longitudinally wrinkled, outer layers of the periderm rather soft, frequently abraded, and thus showing lighter patches; fracture nearly smooth, mealy, and emitting a characteristic puff of dust consisting chiefly of starch grains; internally whitish, with a distinct cambium zone and yellowish wood wedges; nearly inodorous; taste sweetish, afterwards bitterish and strongly acrid. Transverse sections of *Belladonna Root*, when moistened with iodine T. S., should be colored bluish-black and by transmitted light should show an imperfectly radiate structure within and near a conspicuous cambium line. Under the microscope sections exhibit a bark and wood composed mainly of parenchyma, the cells being filled with starch grains, single and 2- to 6- or more compound, the individual grains being somewhat spherical and from 0.003 to 0.030 mm. in diameter. A section cleared with hydrated chloral T. S. should show occasional cells of parenchyma filled with sphenoidal micro-crystals of calcium oxalate in both bark and wood; bark free from bast-fibers; wood containing scattered groups of large tracheæ with simple and bordered pores or reticulated thickenings, and associated in older roots with wood-fibers. Stem fragments of *Atropa Belladonna* occur either separate or attached to the roots, light brown or greenish-brown, finely, longitudinally wrinkled, with transverse leaf-scars, pith frequently hollow. Under the microscope sections of *Belladonna stem* show an outer epidermis with slightly cuticularized walls; a primary cortex of parenchyma, the cells being separated by large, intercellular spaces; an endodermis, beneath which occur in an interrupted circle bast-fibers either singly or in small groups, the walls of which are relatively thin and slightly lignified; a few layers of sieve; a central cylinder of a few tracheæ with numerous wood-fibers; an internal phloem with isolated, small groups of bast-fibers similar to those found in the inner bark; pith, if present, with large irregular parenchyma cells. Powder: Light-brown; starch grains numerous, from 0.003 to 0.030 mm. in diameter, spherical, plano-convex, polygonal, and 2- to 6- or more compound; sphenoidal micro-crystals numerous, from 0.003 to 0.010 mm. in length; fragments of cork cells and tracheæ with wood-fibers few. Occasional fragments of stems of *Belladonna* showing long thin-walled and slightly lignified bast-fibers. Ash not exceeding 7 percent.

Benzoinum.—A balsamic resin obtained from *Styrax Benzoin Dryander*, and other species of *Stryax* (Fam. *Styracæ*) growing in the East Indies, and known in commerce as *Sumatra Benzoin* and *Siam Benzoin*. *Sumatra Benzoin*: In blocks or lumps of varying size, made up of tears, compacted together with a reddish-brown, reddish-gray, or grayish-brown resinous mass; tears externally yellowish or rusty-brown, milky-white on fresh fracture; very hard, becoming soft on warming; odor aromatic, upon digesting with boiling water, suggesting the odor of cinnamic acid or storax; taste aromatic and slightly acrid, the resin gritty on chewing. Heat a few fragments of *Sumatra Benzoin* in a test-tube; a sublimate should be formed consisting of plates and small, rod-like crystals that strongly polarize light. Add carefully an ethereal solution of *Sumatra Benzoin*

to a small quantity of sulphuric acid contained in a porcelain dish; the solution should be colored a brownish-red. Not less than 75 percent. of Sumatra Benzoin should dissolve in alcohol; the alcoholic solution, upon the addition of water, should become milky and give an acid reaction to litmus. Ash not exceeding 2.5 percent. Siam Benzoin: In pebble-like tears of variable size, compressed, yellowish-brown to rusty-brown externally, milky-white on fracture, separate or very slightly agglutinated; fracture short; odor agreeable, balsamic, vanilla-like; taste slightly acid, the resin becoming plastic on chewing. Heat a few fragments of Siam Benzoin in a test-tube; a sublimate should be formed directly above the melted mass consisting of numerous, long, rod-shaped crystals, which do not strongly polarize light. Add carefully an ethereal solution of Siam Benzoin to a small quantity of sulphuric acid contained in a porcelain dish; the solution should be colored purplish-red. Not less than 90 percent. of Siam Benzoin should dissolve in alcohol; the alcoholic solution upon the addition of water should become milky and give an acid reaction to litmus. Ash not exceeding 2 percent. The tests which follow apply to both Sumatra and Siam Benzoin: Heat gently 1 to 2 Gm. of either Sumatra or Siam Benzoin with 15 Cc. of petroleum benzin, and after cooling transfer the supernatant liquid to a separator. Wash with 10 Cc. of a saturated aqueous solution of sodium bicarbonate, draw off and discard the aqueous layer and then wash the mixture in the separator with water until it is free from bicarbonate. On adding 20 Cc. of an aqueous solution of copper acetate (1 in 200) and vigorously shaking the mixture, no green color should be observed in the petroleum benzin layer (rosin and foreign resins). Treat 1 Gm. of powdered Benzoin with 15 Cc. of warm carbon disulphide, filter the solution, wash the filter with an additional 5 Cc. of carbon disulphide and allow the mixed liquids to evaporate spontaneously. A residue, weighing not less than 0.125 Gm. and corresponding to the identification tests under *Acidum Benzoicum*, should remain.

Buchu.—The dried leaves of *Barosma betulina* (Thunberg) Bartling and Wendland, known in commerce as Short Buchu; or of *Barosma serratifolia* (Curtis) Willdenow, known in commerce as Long Buchu (Fam. Rutaceæ), with not more than 10 percent. of stems and other foreign matter. Short Buchu: Rhomboidally oval or obovate; from 9 to 25 mm. in length and 4 to 13 mm. in breadth; summit obtuse, and recurved; margin somewhat serrate or finely dentate with an oil gland at the base of each tooth; the base more or less wedge-shaped; yellowish-green, some being light brown; glandular punctate; both surfaces papillose, under surface longitudinally striate; petiole 1 mm. in length; texture coriaceous; odor and taste characteristic, aromatic and mint-like. Long Buchu: Linear-lanceolate, 2.5 to 4 cm. in length, 4 to 6 mm. in breadth, summit somewhat rounded or truncate with an oil gland at the apex; margin sharply serrate and glandular, otherwise resembling Short Buchu. Stems in both Short and Long Buchu about 1 mm. in diameter, yellowish-green or brownish-red, cylindrical, longitudinally furrowed, with prominent leaf-scars nearly opposite to each other and giving the stems a jointed character. Ash not exceeding 4 percent.

Calumba.—In circular or oval disks attaining a diameter of 9 cm. and seldom exceeding 22 mm. in thickness, or in longitudinal or oblique slices attaining a length of 30 cm., a breadth of 35 mm. and a thickness of 16 mm.; externally brown and roughly wrinkled; cut surface varying from yellowish-brown to gray-

ish-yellow, with a few interrupted circles of fibro-vascular bundles, the transverse slices distinctly radiate in the outer portion and with a dark cambium, central portion often depressed; fracture short, mealy; odor slight; taste slightly aromatic, very bitter. Powder: Greenish-brown to grayish-yellow; starch grains numerous, mostly single, occasionally 2- to 3-compound, the individual grains from 0.003 to 0.085 mm. in the long diameter, ovoid, ellipsoidal, frequently very irregular, slightly lamellated, with an excentral, linear, x-shaped or branching cleft; stone cells few with irregularly thickened, strongly lignified, coarsely porous walls and containing one or more prisms of calcium oxalate 0.010 to 0.030 mm. in length or numerous sphenoidal micro-crystals; fragments with tracheæ few, the latter with reticulate thickenings, or bordered pores, and associated with wood-fibers having long, oblique, slit-like pores. Ash not exceeding 8 percent.

Cambogia.—When rubbed with water it should yield a yellow emulsion becoming darker and almost transparent upon the addition of ammonia water. The emulsion should not turn green upon the addition of iodine T. S. (starch). Powder: Bright yellow, containing few or no starch grains. When mounted in hydrated chloral T. S. and examined under the microscope, the particles, for the most part, should slowly dissolve, leaving scattered fragments of vegetable tissues. Not less than 65 percent. soluble in alcohol. Ash not exceeding 2 percent.

Cannabis.—The dried flowering tops of the pistillate plants of *Cannabis sativa* Linné, or of the variety *indica* Lamarck, (Fam. Moraceæ), freed from the thicker stems and large foliage leaves and with not more than 10 percent. of mature fruits (seeds). In dark green, more or less brownish, compressed, and more or less agglutinated, resinous fragments, consisting of the short stems with their leaf-like bracts and pistillate flowers, a few of the latter being sometimes replaced with more or less developed fruits; stems cylindrical, of varying length, not more than 3 mm. in diameter; longitudinally furrowed, light green to light brown, strigose-pubescent; leaves digitately compound; leaflets, when soaked in water and spread out, linear-lanceolate, nearly sessile, margin deeply serrate; bracts ovate, pubescent, each enclosing 1 or 2 pistillate flowers, or more or less developed fruits; calyx dark green, pubescent and somewhat folded around the ovary or fruit; styles 2, filiform and pubescent; ovary with a single campylotropous ovule; fruit light green to light brown, broadly ellipsoidal, about 3.5 mm. in length; finely wrinkled and slightly reticulated; odor agreeably aromatic; taste characteristic. Powder: Dark green, giving a strong effervescence on the addition of dilute hydrochloric acid; numerous sharp-pointed fragments of upper portion of non-glandular hairs; fragments of bracts and leaves showing yellowish-brown laticiferous vessels, rosette aggregates of calcium oxalate and bases of non-glandular hairs; rosette aggregates of calcium oxalate from 0.005 to 0.025 mm. in diameter; non-glandular hairs, unicellular with a very slender pointed apex and a considerably enlarged base containing, usually in the lumen, some calcium carbonate; glandular hairs of two kinds, one with a short one-celled stalk and the other with a multicellular, long, tongue-shaped stalk, the glandular portion being globular and consisting of from 8 to 16 cells; fragments of fruits with palisade-like, non-lignified sclerenchymatous cells, walls yellowish-brown, finely porous and lumina usually containing air; tissues of embryo and endosperm with numer-

ous oil globules and aleurone grains, the latter from 0.005 to 0.010 mm. in diameter and consisting of large crystalloids and globoids. Alcoholic extractive not less than 8 percent.; alcoholic solution bright green in color. Ash not exceeding 15 percent.

Cantharis.—From 15 to 25 mm. in length, 5 to 8 mm. in breadth, oblong, somewhat compressed above; of a brilliant green or bluish-green, metallic luster, changing in different parts, especially beneath, to a golden-green; head triangular, separated into two lateral lobes by a faint median line; mandibles stout and partly concealed; antennæ filiform, of 11 conical joints, the upper ones being black; eyes comparatively small; prothorax angulate; legs with five tarsal joints; wings membranous and brownish; elytra or wing sheaths each with 2 parallel lines and finely wrinkled; odor strong, disagreeable; taste slight, afterwards acid. Powder: Grayish-brown, with shining green particles and a number of long, pointed, 1-celled hairs about 0.5 mm. in length and 0.002 mm. in width. Moisture not more than 10 percent. Ash not exceeding 9 percent.

Capsicum.—The fruit may include not more than 2 percent. of stems, calyxes and other foreign matter. Oblong-conical, from 8 to 20 mm. in length and from 2 to 15 mm. in diameter; pericarp brownish-red or orange, shining, membranous and translucent; 2- or 3-locular, united below, and containing 6 to 17 flat, reniform, yellowish seeds attached to the placenta or frequently separated from it; calyx light greenish-brown, inferior, inconspicuous, 5-toothed, usually attached to a long, straight peduncle; odor characteristic; sternutatory; taste intensely pungent. Powder: Yellowish-brown; mounts made with hydrated chloral T. S. and examined under the microscope show yellowish-red oil globules; stone cells of two kinds, those of endocarp being more or less elongated, walls yellowish, uniformly and moderately thickened, wavy in outline, porous and slightly lignified, those of the seed coat being yellowish, irregularly and strongly thickened, wavy in outline and strongly lignified. Non-volatile ether-extract not less than 15 percent. Total ash not exceeding 7 percent. Ash insoluble in hydrochloric acid, not exceeding 1 percent.

Cardamomi Semen.—The dried seeds of *Elettaria Cardamomum* White et Maton (Fam. Zingiberaceæ), which should be kept in the capsules until wanted for use. Mostly agglutinated in groups of from 2 to 7, the individual seeds, oblong-ovoid in outline, 3- or irregularly 4-sided, convex on the dorsal surface, strongly longitudinally grooved on one side, from 3 to 4 mm. in length; externally reddish-gray-brown, coarsely tubercled, and with more or less adhering portions of the membranous aril, moderately hard but easily crushed; in section showing a thin reddish-brown seed coat, a large white perisperm and a central greenish endosperm enclosing a small straight embryo; odor aromatic; taste aromatic, pungent. Capsules broadly or narrowly ellipsoidal, occasionally ovoid, more or less triangular in transverse section, from 10 to 20 mm. in length; externally usually of a pale buff color or whitish or greenish-brown; longitudinally striate; 3-locular; pericarp thin; leathery, and nearly tasteless, enclosing from 10 to 20 seeds. Powder: Greenish-brown; consisting chiefly of coarse, angular fragments of cells of the reserve layers and seed-coat; cells of endosperm and perisperm filled with compound starch grains, the individual grains from 0.001 to 0.004 mm. in diameter; fragments of seed-coat with dark brown stone cells, which are

polygonal in surface view and about 0.020 mm. in diameter; in mounts made with hydrated chloral T. S. single prisms or crystals in rosette aggregates may separate in the cells of the endosperm and perisperm; fragments of spiral tracheæ with accompanying slightly lignified bast-fibers, relatively few. Ash not exceeding 8 percent.

Carum.—Mericarps usually separated, crescent-shaped, from 3 to 7 mm. in length, about 1.5 mm. in diameter; externally dark brown with 5 yellowish filiform ribs; in transverse section nearly equilaterally pentagonal, the commissural surface with two vittæ, the dorsal surface with a vitta between each of the primary ribs; oily endosperm large, enclosing a small embryo; odor and taste agreeably aromatic. Under the microscope transverse sections show an epidermal layer of slightly tangentially elongated cells with thick outer walls; a layer of several rows of tangentially elongated parenchyma cells, frequently more or less collapsed; a single, large, elliptical, brown, vitta or oil-tube between each of the ribs and surrounded by small epithelial or secretion cells; in each of the ribs a single fibro-vascular bundle surrounded by a layer of thick-walled sclerenchymatous fibers; inner epidermis of broadly elongated cells with very thin side-walls being very frequently broken and closely coherent with the more or less brownish, collapsed cells of the seed-coat; commissural surface with 2 large vittæ and at the middle portion 2 large transverse hollow spaces formed by the separation of the tissues of the seed-coat on one side and the pericarp on the other, otherwise the cells resemble those on the dorsal surface; endosperm large, cells polygonal with thick walls and containing a fixed oil and aleurone grains, the latter not infrequently containing a small rosette aggregate or prism of calcium oxalate. Powder: Yellowish-brown, mostly of irregular, angular fragments; cells of endosperm with aleurone grains each usually containing a rosette aggregate of calcium oxalate about 0.001 mm. in diameter; fragments with light yellow vittæ, together with nearly isodiametric or polygonal, yellowish-brown, inner epidermal cells of pericarp; fragments with tracheæ and sclerenchymatous fibers, the latter about 0.010 mm. in width, slightly lignified and with numerous oblique pores. Ash not exceeding 8 percent.

Caryophyllus.—The dried flower-bud of *Eugenia aromatica* (Linné) O. Kuntze, (*Jambosa Caryophyllus*) (Sprengel) Niedenzu, (Fam. Myrtaceæ), with not more than 5 percent. of the peduncles, stems and other foreign matter. From 10 to 17.5 mm. in length, of a dark brown or brownish-black color, consisting of a stem-like, solid, inferior ovary, obscurely four-angled or somewhat compressed, terminated by four calyx teeth, and surmounted by a nearly globular head, consisting of four petals, which enclose numerous curved stamens and one style; odor strongly aromatic; taste pungent and aromatic, followed by slight numbness. On pressure Clove emits a volatile oil. Stems either separate or attached to the flower-buds; sub-cylindrical or four-angled, attaining a length of 25 mm., a diameter of 4 mm.; either simple or branching, distinctly jointed and less aromatic than the flower-buds. Powder: Varying from dark brown to reddish-brown; consisting chiefly of cellular fragments showing the large oil reservoirs, spiral tracheæ and a few, somewhat thick-walled, slightly lignified, spindle-shaped bast-fibers; calcium oxalate in rosette aggregates, from 0.010 to 0.015 mm. in diameter; pollen grains numerous, tetrahedral, somewhat ellipsoidal, from 0.015

to 0.020 mm. in diameter. The presence of stems in the powder is shown by stone cells of irregular, polygonal shape, about 0.070 mm. in diameter, with thick porous walls and large lumina, the latter frequently filled with a yellowish-brown amorphous substance. Volatile ether-extract not less than 10 percent. Total ash not exceeding 8 percent. Ash insoluble in hydrochloric acid not exceeding 0.5 percent.

Chondrus.—The dried plant of *Chondrus crispus* (Linné) Stackhouse and *Gigartina mamillosa* (Goodenough et Woodward) J. Agardh (Fam: Gigartineæ). Entire plants more or less matted together, consisting of a slender stalk from which arises a series of dichotomously branching, more or less flattened segments, emarginate or deeply cleft at the tips; 5 to 15 cm. in length, segments 1 to 10 mm. in width; yellowish-white, translucent, frequently coated with a calareous organic deposit which effervesces with hydrochloric acid; sometimes with fruit bodies or sporangia embedded near the apex of the segments in *C. crispus* or with sporangia borne on short, tuberculated projections or stalks, more or less scattered over the upper portion of the segments in *G. mamillosa*, somewhat cartilaginous; odor slight; taste mucilaginous, saline. Boil one part of *Chondrus* for about ten minutes with 30 parts of water and replace the water lost by evaporation; the solutions should form a thick jelly upon cooling. When softened in cold water *Chondrus* should become gelatinous, and transparent, the thallus remaining nearly smooth and uniform and not swollen except slightly at the tips; a solution made by boiling 0.300 Gm. in 100 Cc. of water and filtering gives no precipitate on the addition of tannic acid T. S. (gelatin), and does not give a blue color when cold, upon the addition of iodine T. S. (starch).

Cimicifuga.—The drug may include not more than 2 percent. of stems and foreign matter. Rhizome horizontal, more or less branching, from 2 to 12 cm. in length, from 1 to 2.5 cm. in thickness; externally dark brown, slightly annulate from circular scars of bud-scale leaves, the upper surface with numerous stout, erect or somewhat curved branches terminated by deep cup-shaped scars each of which usually shows a distinct radiate structure; interior and lateral portions with numerous root-scars and a few short roots; fracture horny; internally whitish and mealy or dark brown and waxy, bark thin, wood distinctly radiate and of about the same thickness as the pith; odor slight; taste bitter and acid. Roots somewhat cylindrical or obtusely quadrangular, 1 to 3 mm. in thickness, externally dark brown, longitudinally wrinkled, fracture short; internally, bark dark brown, wood yellowish, 4- to 6-rayed. Under the microscope sections of the rhizome show a yellowish-brown suberized epidermis, a cortex made up of about 30 layers of starch-bearing parenchyma cells; fibro-vascular bundles, collateral, the xylem consisting of tracheæ, with bordered pores, and resembling tracheids in that the ends are rather acute; wood-fibers numerous, thin-walled, strongly lignified and with simple, oblique pores; the bundles separated by starch-bearing parenchyma strands from 5 to 30 cells wide; pith cells numerous, resembling those of the cortex. Under the microscope sections of the roots show a hairy epidermis, which becomes suberized in older roots; the cortex shows about 12 rows of starch-bearing parenchyma cells; endodermis distinct; fibro-vascular bundles 4 to 6, showing in older roots as separate collateral bundles. Powder: Light to dark brown; starch grains numerous, single or compound, the individual grains spherical or more or less polygonal, each with a somewhat central cleft, from

0.003 to 0.015 mm. in diameter; fragments showing tracheæ with bordered pores and lignified wood-fibers; irregular, yellowish-brown fragments of suberized epidermis made up of more or less tabular cells, sometimes elongated and considerably thickened. Ash not exceeding 10 percent.

Cinchona.—Added to the former description: Externally the bark usually shows patches of foliaceous lichens with their small, brownish-black apothecia. Powder: Reddish-brown; bast-fibers spindle-shaped, yellowish, 0.300 to 1.350 mm. in length, with thick, strongly lignified, lamellated walls having slit-like, oblique pores; starch grains single, 2- to 5-compound, the individual grains spherical or plano-convex and from 0.003 to 0.015 mm. in diameter; sphenoidal micro-crystals of calcium oxalate numerous. Heat 1 Gm. of powdered *Cinchona* in a dry test-tube; a tarry distillate should form, having a purplish-red color and a somewhat granular appearance.

Cinchona Rubra.—In quills or curved pieces of variable length, bark from 2 to 4 mm. in thickness; or in small broken fragments or in transversely curved pieces from 3 to 7 mm. in thickness; externally gray or grayish-brown, more or less rough from corky protuberances, sometimes with transverse fissures, rarely numerous or much intersected, and having their sides sloping and with occasional patches of foliaceous lichens; inner surface reddish- or orange-brown, distinctly striate; fracture short and granular in the outer bark, shortly and rather coarsely splintery in the inner bark; slightly odorous; taste very bitter and astringent. Powder: Light brown; bast-fibers and sphenoidal micro-crystals of calcium oxalate resembling those in *Cinchona*; starch grains resembling those of *Cinchona*, relatively few, from 0.003 to 0.010 mm. in diameter. Heat 1 Gm. of powdered Red *Cinchona* in a dry test-tube; a tarry distillate should form, having a bright red color.

Cinnamomum Saigonicum.—In quills attaining a length of 30 cm. and from 3 to 30 mm. in diameter; the bark from 0.5 to 3 mm. in thickness; outer surface light brown to dark purplish-brown with grayish patches of foliaceous lichens, numerous bud-scars, finely wrinkled, especially the bark of younger twigs, otherwise more or less rough from corky patches surrounding the lenticels; inner surface reddish-brown to dark brown, granular, and slightly striate; fracture short; inner bark porous, owing to the presence of large oil cells; and separated by a continuous layer of stone cells from the outer bark. Odor aromatic; taste sweetish, aromatic and pungent. Under the microscope sections of the older bark show a thin layer of more or less lignified cork cells; a narrow layer of starch-bearing parenchyma with scattered stone cells; a nearly continuous zone, several layers wide, of stone cells, among which should be small groups of bast-fibers with thickened and slightly lignified walls; a wide inner bark with medullary rays 1 to 3 cells in width, isolated bast-fibers, mucilage cells, oil cells and parenchyma, the cells of the latter either filled with starch grains or containing very small raphides of calcium oxalate; the lumina of parenchyma cells, stone cells and bast-fibers frequently filled with an amorphous, reddish-brown substance, which should be for the most part insoluble in the ordinary reagents. In the bark of young twigs there should be an epidermal layer with a thick, yellowish cuticle, fewer stone cells in the zone associated with bast-fibers, and the inner bark should be narrower and with fewer secretion cells than in the older bark. Powder: Yellow-

ish- or reddish-brown; starch grains numerous, single or compound, the individual grains being somewhat ellipsoidal or polygonal and from 0.003 to 0.020 mm. in diameter; fragments, with colorless stone cells rather prominent, the cells being very irregular in shape and the lumina containing either air or a reddish-brown amorphous substance; bast-fibers from 0.300 to 1.500 mm. in length and usually in groups of from 2 to 20, with very thick and scarcely lignified walls; numerous cellular, reddish-brown fragments in which the oil cells are not readily distinguishable. Volatile ether-extract not less than 2 percent. Total ash not exceeding 6 percent. Ash insoluble in diluted hydrochloric acid not exceeding 2 percent.

Cinnamomum Zeylanicum.—The dried bark of cultivated trees of *Cinnamomum zeylanicum* Breyne (Fam. Lauracæ) with not more than 3 percent. of the outer bark. In closely rolled double quills, composed of from 7 to 12 thin layers of separate pieces of bark, from 30 to 50 cm. in length and from 8 to 13 mm. in diameter; the bark attaining a thickness of 1 mm.; outer surface pale yellowish-brown, smooth, longitudinally striate with narrow yellowish groups of bast-fibers, and showing circular or irregular brownish patches, occasionally with perforations marking the nodes; inner surface light brown, with faint, longitudinal striations; fracture short with projecting bast-fibers; odor agreeably aromatic; taste sweetish and warmly aromatic. Under the microscope sections usually show no cork but an almost continuous outer layer of stone cells, among which are small groups of bast-fibers resembling those found in Saigon Cinnamon; in the inner bark occur numerous bast-fibers singly or in small groups, medullary rays 1 to 2 cells in width, usually with raphides of calcium oxalate; parenchyma with either reddish-brown contents or more or less filled with starch grains; scattered throughout the parenchyma occur oil-secretion cells and mucilage cells. Powder: Light brown or yellowish-brown; starch grains numerous, varying from spherical to polygonal, from 0.003 to 0.020 mm. in diameter, frequently in small aggregates; bast-fibers from 0.300 to 0.800 mm. in length, usually single, spindle-shaped with attenuated ends, the walls being very thick and but slightly lignified; colorless stone cells resembling those of Saigon Cinnamon; numerous cellular fragments with yellowish-brown walls or contents; cork cells few or none; calcium oxalate in raphides from 0.005 to 0.008 mm. in length. Volatile ether-extract not less than 0.5 percent. Total ash not exceeding 6 percent. Ash insoluble in diluted hydrochloric acid, not exceeding 2 percent.

Coccus.—The dried female insect enclosing her young larvæ, *Coccus Cacti* Linné (Fam. Coccidæ). Somewhat ovate in outline, convex above, concave beneath, from 3.5 to 5 mm. in length, consisting of from 9 to 12 segments; externally grayish-purple, or grayish; in the shell-like, somewhat horny abdomen lie numerous larvæ less than 1 mm. in size; the mature larvæ with antennæ consisting of eight parts, 3 pairs of legs, the lower being with 6 to 8 segments, and a characteristic beak or rostrum composed of 4 thread-like parts which pair off into two coils. Cochineal is easily pulverizable and yields a dark red powder; with a characteristic odor and slightly bitter taste. When masticated it colors the saliva red, due to the coloring principle, carminic acid, which is soluble in water, alcohol, or alkalies, and slightly soluble in ether, but insoluble in fixed and volatile oils. Alkalies should change the color of solutions of Cochineal to purple, while acids

should change the color to reddish-yellow. When macerated in water no insoluble powder should separate. Ash not exceeding 6 percent.

Colchici Cormus.—Usually in reniform transverse, or in ovate longitudinal slices; from 2 to 5 mm. in thickness; flat surfaces whitish, slightly roughened, and of a crystalline appearance under the hand lens; epidermal surface thin, light brown and finely wrinkled; fracture short and mealy, odor slight; taste bitter and acrid. Powder: Light brown or grayish-brown; starch grains numerous, single or 2- to 6- compound, the individual grains varying from spherical or ovoid to polygonal, and marked with a triangular or star-shaped, central cleft from 0.003 to 0.030 mm. in diameter, tracheæ few and with spiral or scalariform thickenings; occasional fragments of epidermal cells with thin, reddish-brown walls.

Colchici Semen.—The seeds should be dried; ovoid or irregularly globular, more or less pointed at the hilum, from 2 to 3 mm. in diameter; when fresh, several seeds cohering; externally dark brown, finely pitted; tough and of almost bony hardness; internally whitish or light brown; nearly inodorous; taste slightly bitter and somewhat acrid. Under the microscope transverse sections show a seed-coat of a few, more or less collapsed cells with thin reddish-brown walls; the endosperm, making up most of the seed, should consist of cells with rather thick, porous walls; and the lumina containing oil globules and aleurone grains, the latter being from 0.003 to 0.015 mm. in diameter; the embryo is small, the beaked portion, or caruncle, containing numerous, somewhat ovoid, ellipsoidal or polygonal starch grains, from 0.005 to 0.016 mm. in diameter. Ash not exceeding 8 percent.

Colocynthis.—The dried pulp of the fruit of *Citrullus Colocynthis* Schrader (Fam. Cucurbitaceæ), with not more than 5 percent. of seeds, nor more than 2 percent. of epicarp. Nearly globular, whole fruits from 4 to 7 cm. in diameter, usually more or less crushed and in broken pieces, with occasional patches of the nearly smooth epicarp; yellowish-white or brownish; light, spongy; separable longitudinally when entire into three carpels, each containing near the outer surface, the ovoid, compressed, yellowish seeds; odor slight; taste intensely bitter. Powder: In the preparation of the powder the fruit should be deprived of its seeds so that the finished product should contain not more than 5 percent. of seeds; yellowish-white or buff, consisting chiefly of fragments of parenchyma cells and an occasional fragment with tracheæ; very few lignified tissues of the seed-coat, showing the characteristic stone cells which are nearly isodiametric, irregular, with either straight or undulate walls that are strongly lignified and possess simple pores; globules of fixed oil and aleurone grains very few. The petroleum benzin extract from powdered *Colocynthis* should yield not more than 2 percent. of fixed oil. Ash not exceeding 15 percent.

Condurango.—The dried bark of *Marsdenia Condurango* Reichenbach filius, (Fam. Asclepiadaceæ). In single quills or transversely curved pieces, usually from 4 to 13.5 cm. in length, bark from 1 to 6 mm. in thickness; outer surface light grayish-brown to dark brown, nearly smooth and with numerous lenticels, or more or less scaly and considerably roughened, the scales soft, occasionally with brownish-black apothecia of a fungus; inner surface grayish-white or light brown, longitudinally striate; fracture short and granular or short-fibrous; odor slightly aromatic, especially marked in the fresh drug; taste bitter and aromatic. Under

the microscope sections show a corky layer consisting of several rows of thin-walled cells, frequently with yellowish-brown contents; a layer of phelloderm of 8 to 10 rows of cells, containing either starch grains or membrane crystals of calcium oxalate, the latter in prisms from 0.010 to 0.035 mm. in length; a primary cortex of collenchyma containing chloroplasts, starch grains, or rosette aggregates of calcium oxalate from 0.015 to 0.040 mm. in diameter; a pericycle or pericambium of tangentially elongated parenchyma cells, with groups of bast-fibers and laticiferous vessels in an interrupted circle; middle bark with large groups of stone cells, varying from nearly isodiametric to elongated, sometimes very irregular in form; inner bark with medullary rays 1 to 2 cells wide, numerous laticiferous cells accompanied by small groups of sieve cells, parenchyma containing either starch grains or rosette aggregates of calcium oxalate, and an occasional isolated bast-fiber or small groups of stone cells. Powder: Light yellowish-brown; consisting chiefly of fragments of stone cells and parenchyma containing calcium oxalate crystals and starch grains; stone cells chiefly in large groups, the individual cells being more or less irregular in shape with very thick, porous walls, the lumina being usually filled with air; calcium oxalate chiefly in rosette aggregates, occasionally in single prisms, mostly from 0.015 to 0.020 mm. in diameter; starch grains mostly single, frequently 2- to 4-compound, the individual grains being from 0.003 to 0.015 mm. in diameter; bast-fibers non-lignified, very long and from 0.010 to 0.035 mm. in width; fragments of thin-walled latex tubes from 0.015 to 0.025 mm. in diameter and filled with a granular substance; fragments of cork grayish- or light yellowish-brown. Macerate 1 Gm. of the powdered bark in 5 Cc. of cold water, filter and heat the filtrate in a test-tube; it should become very cloudy but on cooling assumes its original transparency. Ash not exceeding 12 percent.

Convallaria.—Rhizome horizontal, elongated, usually branched, cylindrical, variable in length, from 1 to 3 mm. in diameter; externally yellowish-white or pale-brown, with a few circular stem-scars; from the under and side portions at the nodes usually arise from 3 to 5 thin, tortuous, dark brown, branching roots; fracture short or fibrous; internally whitish; odor faint; taste sweetish, becoming bitter and acrid. Under the microscope sections of the rhizome show an epidermal layer with a thick outer layer of cutin; a hypodermal layer of a single row of collenchyma; a cortex made up of about 20 rows of parenchyma cells, some of which contain starch and raphides of calcium oxalate; a prominent endodermis, the radial and inner walls of which are strongly thickened and lignified; inside the endodermis is an interrupted circle of collateral fibro-vascular bundles, the woody portion of which should be in cross section the shape of the letter "V"; inside this circle of bundles is another interrupted circle of fibro-vascular bundles of the concentric type, the sieve tissue being surrounded by the xylem; the parenchyma cells of the pith are separated by large intercellular spaces. Under the microscope transverse sections of the root show a hairy epidermal layer, a hypodermis of a single row of cells; a cortex of about 6 rows of cells, some of which should contain starch, raphides and oil; the cells of the endodermal layer resemble those of the rhizome; fibro-vascular bundles mostly 5. Powder: Dark brown, tending to cake on standing, consisting chiefly of cellular fragments and a few starch grains and raphides of calcium oxalate; cells of endodermis quite long

with slightly oblique ends; the walls being considerably thickened, lignified and porous; fragments of tracheæ with spiral and scalariform thickenings or with porous walls; starch grains single or compound, mostly nearly spherical, and from 0.003 to 0.012 mm. in diameter; raphides of calcium oxalate few, from 0.020 to 0.045 mm. in length.

Coriandrum.—The fruit should contain not more than 5 percent. of other fruits, seeds and other foreign matter. Mericarps usually coherent; cremocarp nearly globular, from 3 to 5 mm. in diameter; externally light brown or rose colored; summit with 5 calyx teeth and a short stylopodium, each mericarp with 5 prominent, straight, longitudinal primary ribs and 4 indistinct, undulate, secondary ribs; mericarps easily separated, deeply concave on the inner or commissural surface and showing in transverse section 2 vittæ (oil-tubes) on the inner surface of each. Under the microscope sections show an epidermis of small cells with thick walls; a layer of several rows of thin-walled, more or less collapsed, parenchyma separated from a broad zone of strongly lignified sclerenchymatous fibers which extend as a continuous ring in the mesocarp of each of the mericarps; 2 or 3 layers of large, tangentially elongated, thin-walled, parenchyma cells, frequently with numerous, large, lysigenous, intercellular spaces; inner epidermis of large, tabular cells, the inner, yellowish walls being considerably thickened and closely coherent to the brownish cells of the seed-coat; commissural surface with 2 large elliptical vittæ, the cells of the pericarp separated from the seed-coat and forming a large elliptical cavity; endosperm distinctly reniform in outline and consisting of tabular or polygonal, thick-walled cells, containing numerous large aleurone grains each with a rosette aggregate or prism of calcium oxalate. Powder: Light brown, consisting chiefly of fragments of endosperm and lignified tissues of the pericarp; calcium oxalate crystals numerous, from 0.003 to 0.010 mm. in diameter, mostly in rosette aggregates, either isolated or in aleurone grains; sclerenchymatous fibers irregularly curved, having thick, yellowish, lignified walls and numerous simple pores; globules of fixed oil numerous; fragments of light-yellow vittæ few, associated with elongated, polygonal, epidermal cells. Volatile ether-extract not less than 0.5 percent. Ash not exceeding 7.5 percent.

Cubeba.—The dried, full grown, unripe fruits of *Piper Cubeba* Linné filius (Fam. Piperacæ), with not more than 5 percent. of stems and other foreign matter. Upper portion globular, 3 to 6 mm. in diameter, with a straight, slender, stem-like portion from 5 to 7 mm. in length; pericarp externally grayish, brownish or bluish-black; coarsely reticulate; about 0.3 mm. in thickness, easily cut, 1-locular, 1-seeded; the immature seed attached at the base of the pericarp; odor aromatic, distinct; taste strongly aromatic and pungent. Under the microscope sections show an epidermal layer of tabular cells with thickened, undulate outer walls, the contents being olive-green; 1 or 2 rows of parenchyma cells, the contents resembling those of the epidermal cells; a continuous layer of radiately elongated, thick-walled stone cells, having numerous pores; a few layers of collapsed cells near which may occur an occasional small group of bast-fibers; a middle layer of 10 rows of cells composed chiefly of parenchyma, scattered among which are numerous secretion cells containing a volatile oil and occasionally crystals in the form of short rods, the contents of the secretion cells being colored a deep crimson upon the addition of sulphuric acid; an endocarp of small, somewhat isodia-

metric or polygonal stone cells with very thick, porous walls; seed-coat of several rows of reddish-brown, tangentially elongated, more or less collapsed cells; perisperm of numerous, thin-walled parenchyma, the cells being more or less polygonal in shape and containing either small, compound starch grains, or globules of a fixed oil or occasionally a crystal of calcium oxalate. Powder: Light brown to blackish-brown, consisting of a more or less even distribution of starch-bearing cells of the perisperm, and fragments of the pericarp with stone cells; starch grains numerous, single or compound, from 0.002 to 0.012 mm. in diameter; stone cells numerous, in palisade-like groups, in surface view rounded or polygonal with rather prominent dark lumina and yellowish porous walls; secretion cells with a yellowish, oily content becoming reddish on the addition of sulphuric acid; fragments of stalk few, with spiral tracheæ and groups of sclerenchymatic fibers from 0.050 to 1.000 mm. in length with blunt, rounded, or very much attenuated ends, the walls strongly lignified and with numerous oblique pores. Volatile ether-extract not less than 10 percent. Total ash not exceeding 8 percent.

Digitalis.—The dried leaves of *Digitalis purpurea* Linné (Fam. Scrophulariaceæ) with not more than 2 percent. of stems, flowers, and other foreign matter; leaves when entire attaining a length of 30 cm. and a breadth of 15 cm., ovate to oval, abruptly contracted into winged petioles, the latter from 5 to 10 cm. in length, or, in the smaller leaves, nearly absent; margin crenate, irregular; the commercial article usually more or less crumpled and broken, thin, dull, pale green or gray and densely pubescent on the lower surfaces; upper surfaces wrinkled, sparsely hairy; the venation conspicuously reticulated; the mid-ribs and principal veins broad and flat, often purplish, the lower veins continued into the wings of the petioles; odor slight, characteristic; taste strongly bitter. Powder: Dark green, with numerous fragments of non-glandular hairs consisting of from 2 to 8 cells (usually 2 to 5 cells), varying in length from 0.145 to 0.435 mm., some of the cells being frequently collapsed; glandular hairs few, small, with a 1- or 2-celled stalk and a 1- or 2-celled glandular head; numerous irregular fragments of lumina showing stomata and occasional water-pores and elongated fragments of veins and petioles showing fibro-vascular tissues. Ash not exceeding 10 percent.

Ergota.—The carefully dried sclerotium of *Claviceps purpurea* (Fries) Tulasne (Fam. Hypocreaceæ), replacing the grain of rye, *Secale cereale* Linné (Fam. Gramineæ), with not more than 5 percent. of harmless seeds, fruits and other foreign matter. Cylindrical, obscurely three-angled, tapering towards both ends, obtuse, somewhat curved, from 1 to 4.5 cm. in length and 3 to 5 mm. in thickness; externally purplish-black, or brownish-black, longitudinally furrowed; fracture short, pinkish or reddish-white, sometimes whitish; odor peculiar, disagreeable; taste disagreeable, bitter. Pour hot water on bruised Ergot; no ammoniacal or rancid odor should be developed. Powder: Grayish-brown, consisting chiefly of whitish fragments composed of false parenchyma of compacted hyphæ and a few purplish colored fragments of the outer layer of the sclerotium; mounts made in hydrated chloral T. S. or in sulphuric acid show the separation of numerous globules of a fixed oil and many of the fragments should be colored yellowish, reddish or rose-purple. Ash not exceeding 5 percent.

Ergot should be dried at a temperature not exceeding 70° C. The drug deteriorates with age if improperly stored. It should be kept in tightly closed containers protected from the light and to which a few drops of chloroform should be added from time to time to prevent attack by insects. The powdered drug should not be kept longer than one year.

Eriodictyon.—The leaves may include not more than 5 percent. of stems or other foreign matter. Usually in fragments; when entire, laminae lanceolate, 5 to 15 cm. in length, 1 to 3 cm. in breadth; summits acute; bases slightly tapering into a short petiole; margins irregularly serrate or crenate-dentate; upper surfaces yellowish-brown, covered with a more or less shiny resin; under surfaces grayish or yellowish-white, conspicuously reticulate with greenish-yellow veins; minutely tomentose between the reticulations; coriaceous, brittle; odor aromatic; taste balsamic, bitter, becoming sweetish. Under the microscope transverse sections of the laminae of *Eriodictyon* show upon the upper surface large epidermal cells, the outer walls being very uneven owing to indentations which appear as striations in surface view; glandular hairs numerous, with short 1-celled stalks and 6- to 8-celled glandular heads; palisade cells very narrow, from 2 to 6 rows deep containing numerous chloroplastids; cells of dorsal-pneumatic tissue (loose mesophyll) very few; fibro-vascular tissues not strongly developed except in the mid-rib and more prominent veins; numerous, 1-celled, much twisted, thick-walled, non-glandular hairs on the lower surface between the veins. Under the microscope sections of the stems show the epidermis usually replaced by strongly lignified cork; cortex of from 10 to 20 rows of more or less rounded cells; bast-fibers deep-seated and with thick, more or less strongly lignified walls, occurring in small groups forming a more or less interrupted circle; sieve tissues in a narrow zone; wood wedges consisting of tracheae with spiral thickenings, simple or bordered pores and numerous, strongly lignified wood-fibers, separated by medullary rays 1-cell in width; pith very large, the walls of the cells being strongly lignified and with numerous simple pores.

Eucalyptus.—The leaves may include not more than 3 percent. of the stems, fruits, and other foreign matter. Laminae lanceolately scythe-shaped, from 8 to 30 cm. in length, from 2 to 7.5 cm. in breadth; summits when present acute or acuminate; bases unequal, obtuse or more or less rounded and connected with twisted petioles from 5 to 35 mm. in length; margins slightly uneven, revolute; coriaceous; both surfaces varying from pale yellowish-green to grayish-green and more or less glaucous, glabrous, glandular-punctate and with numerous, small circular, brown dots of cork; veins of the first order anastomosing with each other and forming a line nearly parallel with the margin; odor slightly aromatic; taste aromatic, bitter, and cooling. Under the microscope sections show the upper and lower surfaces with nearly similar cells, the outer walls being strongly cuticularized; stomata occur on both surfaces; a region of palisade cells made up of from 3 to 4 rows of cells occurring beneath each surface; among the palisade cells occur large oil-secretion reservoirs, with a yellowish or orange colored oily content; calcium oxalate crystals in cells of the loose mesophyll in the form of rosette aggregates or monoclinic prisms varying from 0.015 to 0.025 mm. in diameter. At the periphery of the fibro-vascular

bundles of the mid-rib and petiole occurs a more or less interrupted circle of small groups of slightly lignified bast-fibers.

Euonymus.—The bark may include not more than 3 percent. of wood and other foreign matter. Usually in transversely curved pieces, occasionally in single quills 2 to 7 cm. in length; bark 1 to 2.5 mm. in thickness; very light in weight; outer surface grayish or light brown, somewhat wrinkled, occasionally transversely fissured from the lenticels and with scale-patches of soft cork; inner surface grayish-white, longitudinally striate and somewhat porous; fracture short with silky, projecting, bast-fibers; odor distinct; taste bitter and acrid. Powder: Light brown; starch grains numerous, nearly spherical, 0.003 to 0.012 mm. in diameter; fragments of cork with nearly colorless thin walls; secretion cells with yellowish or brownish amorphous contents; bast-fibers very long, with thin, non-lignified walls possessing numerous small, more or less oblique pores; numerous fragments of starch-bearing parenchyma; calcium oxalate in rosette aggregates from 0.015 to 0.035 mm. in diameter, the amount in different specimens showing some variation.

Feniculum.—The dried ripe fruits of cultivated varieties of *Feniculum vulgare* Miller (Fam. Umbelliferae), with not more than 2 percent. of harmless foreign matter. Mericarps usually separate, each being broadly elliptical, more or less curved, from 4 to 10 mm. in length, from 1 to 3.5 mm. in breadth, some having a slender stalk from 2 to 10 mm. in length; dorsal surface convex, yellowish-green to grayish-brown, with three prominent, longitudinal primary ribs and at the summit a short, conical stylopodium; commissural surface with three narrow, light brown, longitudinal areas separated by two dark brown or brownish-black areas containing the vittæ or oil-tubes; odor and taste aromatic and distinct. Under the microscope transverse sections of Fennel show a pentagonal mericarp, 4 of the edges being nearly equal and slightly concaved, the other or commissural surface being much longer and more or less undulate; cells of the seed-coat closely united with those of the pericarp, giving the section two very distinct areas, the inner and larger portion more or less rounded-pentagonal and somewhat reniform, composed of polygonal cells, filled with aleurone grains containing rosette aggregates of calcium oxalate, and a thin protoplasmic layer enclosing a fixed oil; the outer or pericarp layer distinguished by large elliptical vittæ with thick, brown walls, occurring singly and alternating with the primary ribs, and two vittæ on the dorsal surface, making usually six vittæ in all, there sometimes being, however, one or two vittæ additional; in the central portion of each of the ribs occurs a nearly circular, fibro-vascular bundle with a few tracheæ and numerous, thin-walled, strongly lignified, sclerenchymatous fibers. Powder: Yellowish-brown consisting of irregular, angular fragments; tissues of endosperm, colorless, the cells filled with aleurone grains each containing a rosette aggregate of calcium oxalate, about 0.002 mm. in diameter; fragments containing yellowish-brown vittæ, from 0.100 to 0.200 mm. in width; sclerenchymatous fibers few, strongly lignified and with numerous, oblique, simple pores; parenchyma cells with more or less thick walls and simple pores and occasionally reticulately thickened; tracheæ few and either spiral or annular; in mounts made with hydrated chloral T. S. numerous globules of a fixed oil separate. Ash not exceeding 10 percent.

Frangula.—The dried bark of *Rhamnus Frangula* Linné (Fam. Rhamnaceæ). In quills varying in length, frequently flattened or crushed; from 0.5 to 1 mm. in thickness; outer surface grayish-brown or purplish-black, with numerous, prominent, lighter colored, transverse lenticels and occasional patches of foliaceous lichens bearing small, blackish apothecia; inner surface smooth, dark brown with occasional purplish blotches, longitudinally striate, becoming red when moistened with solutions of the alkalis; fracture short, slightly fibrous in the inner layer; odor distinct; taste slightly bitter. Under the microscope transverse sections show a distinctly undulate, corky layer, composed of about 12 rows of reddish-brown cells; parenchyma cells of the primary cortex with numerous rosette aggregates of calcium oxalate from 0.010 to 0.025 mm. in diameter; inner bark with bast-fibers in narrow, interrupted rows, the groups of fibers being separated radially by the medullary rays; bast-fibers with thick, strongly lignified, yellowish walls and narrow lumina and each group surrounded by a layer of crystal-fibers, the prismatic crystals of calcium oxalate, varying from 0.007 to 0.015 mm. in diameter; medullary rays 1 to 2 cells in width, occasionally 3; cells of the parenchyma and medullary rays with numerous starch grains about 0.003 mm. in diameter. Powder: Yellowish-brown; stone cells absent (distinguishing it from powder of *Rhamnus Purshiana*). Add 0.100 Gm. of powdered *Frangula* to 10 Cc. of hot water, shake the mixture occasionally until cold and filter it. On the addition of a few drops of ammonia water, the filtrate should be colored a deep red. Macerate 0.100 Gm. of powdered *Frangula* with 10 drops of alcohol; add 10 Cc. of water, boil the mixture and filter it when cold. Shake the filtrate with 10 Cc. of ether, separate the yellow, ethereal solution, and shake 3 Cc. of this ethereal liquid with 3 Cc. of ammonia water; the separated ammoniacal solution, on diluting with 20 Cc. of water, should still possess a distinct cherry-red color. Ash not exceeding 6 percent.

Galla.—An excrescence on the young twigs of *Quercus infectoria* Olivier and other allied species of *Quercus* (Fam. Fagaceæ), induced by the punctures on the leaf-buds and by the deposited ova of *Cynips tinctoria* Hartig (Fam. Hymenoptera). Nearly globular, from 0.8 to 2.2 cm. in diameter; externally blackish-olive-green or blackish-gray, more or less tuberculated on the upper portion, the basal portion being nearly smooth and contracted into a short stalk, heavy, sinking in water excepting the smaller galls which should not be present to a greater extent than 5 percent.; fracture short-horny, internally grayish or dark brown, consisting of a central portion slightly radiating and resinous, occasionally hollow and traversed by a narrow radial canal extending to the exterior as shown by the perforation in the whole gall; odor slight; taste strongly astringent. Powder: Numerous fragments of thick-walled, starch-bearing parenchyma; starch grains numerous, more or less free in the powder and varying in shape from spherical or ellipsoidal to polygonal, and from 0.005 to 0.030 mm. in diameter; stone cells few, resembling those found in fruits and seeds, varying considerably in shape and size, from 0.025 to 0.300 mm. in length; occasional fragments with spiral or reticulate tracheæ; fragments mounted in very dilute ferric chloride T. S. should become of a deep blue or greenish-blue color. Macerate 0.5 Gm. of powdered Nutgall with 2 Cc. of alcohol for a few minutes, add 500 Cc. of water, stir the mixture well for five minutes and filter. On adding a drop of ferric chloride

T. S. to 1 Cc. of this filtrate, diluted with 10 Cc. of distilled water, a distinct blue or violet-blue color should develop.

Gambir.—A dried extract prepared from decoctions of the leaves and twigs of *Ouroparia Gambir* (Hunter) Baillon (Fam. Rubiaceæ). Usually in cubical or rectangular pieces; from 20 to 30 mm. in diameter; externally pale grayish-brown to reddish-brown, more or less dull and porous; friable, internally of a light brown or dull earthy color; inodorous; taste bitterish and very astringent. Upon scraping a piece of Gambir and mounting the separated fragments in hydrated chloral T. S. and examining them under the microscope, numerous acicular crystals, from 0.010 to 0.030 mm. in length, should separate at the edges of the fragments which gradually dissolve leaving a few thick-walled, non-glandular hairs which, when entire, may be 0.350 mm. in length; a few fragments of leaves may also be present showing either epidermal cells or small narrow tracheæ with spiral or annular markings; a few starch grains either single or compound, of variable shape and from 0.005 to 0.015 mm. in diameter; a number of bacteria may also be present. Macerate 1 Gm. of Gambir with 50 Cc. of water and filter. Separate portions of this filtrate should give an intense, green color with dilute ferric chloride T. S. and no precipitate with copper sulphate T. S. Not less than 65 percent. of Gambir should be soluble in water and not less than 60 percent. should be soluble in alcohol. Ash changed from "not more than 5 percent." to "not exceeding 9 percent."

Gelsemium.—Rhizome, cylindrical, usually in pieces from 3 to 20 cm. in length, and from 3 to 30 mm. in diameter; externally light yellowish-brown, longitudinally wrinkled, with purplish-brown, longitudinal lines and transverse fissures; the upper surface with a few stem-scars, the under and side portions with numerous roots and root-scars; fracture tough, splintery; internally light brown or pale yellow, bark thin, wood distinctly radiate, excentral, pith disintegrated; odor slight; taste bitter. Roots, light brown; fracture one-half transverse, the other oblique or splintery. Under the microscope sections of the rhizome show a strong development of cork, the walls being grayish or yellowish-brown and more or less lignified; a cortex made up chiefly of parenchyma containing starch and having in the outer portion small scattered groups of stone cells or sclerenchymatous fibers, and in the inner portion, in the region of the medullary ray cells, prisms of calcium oxalate; woody portion made up of broad wedges consisting of large tracheæ and wood-fibers separated by starch-bearing medullary rays, the innermost cells, or those nearer the pith, being strongly lignified, while the outermost layers, or those nearer the cortex, are non-lignified and may contain prisms of calcium oxalate; an internal phloem or sieve, the cells forming distinct, more or less rounded groups, the latter being partly surrounded by a thin-walled, starch-bearing pith. Powder: Dark yellow, tracheæ with bordered pores, numerous and conspicuous, spiral tracheæ few; bast-fibers and tracheids long and narrow, strongly lignified; starch grains spherical, from 0.004 to 0.008 mm. in diameter; calcium oxalate in monoclinic prisms from 0.015 to 0.030 mm. in length; occasional groups of stone cells or sclerenchymatous fibers, the walls being very thick, porous and strongly lignified.

Gentiana.—In nearly cylindrical, sometimes branching pieces, of variable length, from 5 to 35 mm. in thickness; externally yellowish-brown, the rhizome

portion annulate, the roots longitudinally wrinkled; fracture short and uneven when dry, but tough and flexible when damp; internally yellowish-brown, the bark from 0.5 to 2 mm. in thickness, separated from the somewhat spongy, woody portion by a dark brown cambium zone; odor strong, characteristic; taste slightly sweetish, then strongly and persistently bitter. Powder: Light brown or yellowish-brown, consisting chiefly of parenchymatous cells with fragments of scalariform or reticulate tracheæ; starch grains few or none. Stone cells and sclerenchymatous fibers are absent (absence of endocarp of *Olea Europea* Linné). Ash not exceeding 6 percent.

Glycyrrhiza.—Botanical sources now given as *Glycyrrhiza glabra* Linné var. *typica* Regel et Herder, or *Glycyrrhiza glabra* Linné var. *glandulifera* Regel et Herder. Spanish Licorice: (also known as Italian, Levant, Turkish or Arabian Licorice). Nearly cylindrical, upper portion more or less knotty, usually in pieces from 14 to 20 cm. or more in length, and from 5 to 20 mm. in thickness; externally yellowish-brown or dark brown, longitudinally wrinkled, the thinner rhizomes being often with prominent alternate buds, the thicker rhizomes with distinct corky patches; fracture coarsely fibrous; internally lemon-yellow, radiate, bark 1 to 3 mm. in thickness; wood porous, in narrow wedges, rhizome with small pith; odor distinct; taste sweetish and slightly acrid. Under the microscope transverse sections of pieces of the older rhizome of Spanish Licorice show a periderm of numerous layers of yellowish-brown cork cells; a phellogen and one or more rows of cells of the phelloderm, the cells showing a tendency to collenchymatic thickenings and with occasional monoclinic prisms of calcium oxalate; a middle bark of starch-bearing parenchyma, and whitish groups of bast-fibers surrounded with crystal-fibers; inner bark with a very characteristic radial arrangement of phloem and medullary rays, the phloem consisting of wedges of small groups of bast-fibers and parenchyma, separated by an almost continuous, obliterated sieve tissue, the cells of the latter being very irregular in outline and with thick, highly refracting walls, medullary rays 1 to 8 cells wide; wood characterized by broad wedges consisting of large tracheæ with yellowish walls, small compact groups of wood-fibers and starch-bearing parenchyma alternating with the broad medullary rays; pith composed of parenchyma, the cells being large, more or less polygonal in outline and containing numerous starch grains, or prisms of calcium oxalate. In sections of roots the pith is wanting. Russian Licorice: Nearly cylindrical, somewhat tapering, sometimes split longitudinally, from 15 to 30 cm. in length, and from 1 to 5 cm. in diameter, when deprived of the outer corky layer it is externally pale lemon-yellow; fracture coarsely fibrous, internally lemon-yellow; wood radially cleft; odor distinct; taste sweetish. Under the microscope transverse sections of the rhizome and roots of Russian Licorice somewhat resemble those of Spanish Licorice but the cork cells are wanting. Powder: Pale brownish-yellow (Spanish Licorice) or pale yellow (Russian Licorice), starch grains numerous mostly single and elliptical or oval, and from 0.002 to 0.020 mm. in diameter; tracheæ mostly with bordered pores; wood- and bast-fibers numerous, strongly lignified, very long, very attenuated at the ends, and about 0.010 mm. in width; crystal-fibers with monoclinic prisms of calcium oxalate, the latter from 0.010 to 0.020 mm. in diameter; occasional fragments of reddish-brown cork cells occur in Spanish Licorice, but are practically want-

ing in the Russian Licorice. Add 10 Gm. of powdered Glycyrrhiza to 100 Cc. of distilled water, allow the mixture to macerate for 15 minutes with occasional stirring and then heat it for one-half hour on a water-bath and filter the mixture and add enough water to make the filtrate measure 100 Cc.; 10 Cc. of this filtrate when evaporated and dried at 100° C. should leave a residue of not less than 0.200 Gm. Ash not exceeding 7 percent.

Granatum.—The dried bark of the stem and root of *Punica Granatum* Linné (Fam. Punicacæ) with not more than 2 percent. of wood and other foreign matter. Stem Bark: Mostly in somewhat flattened or transversely curved pieces, to some extent in quills, 2 to 8 cm. in length; bark 0.5 to 3.5 mm. in thickness; outer surface yellowish to grayish-brown, with grayish patches of foliaceous lichens with their brownish-black apothecia, longitudinally wrinkled, also marked with small broadly elliptical lenticels and with more or less abraded patches of cork; inner surface light yellow or yellowish-brown, finely striate; fracture short, smooth, inner bark yellowish-green; odor slight; taste astringent, somewhat bitter and nauseous. Root Bark: In transversely curved pieces; externally brownish-yellow to dark brown and with irregular patches of cork; internally dark yellow, the medullary rays extending nearly to the outer surface. Powder: Yellowish-brown to dark brown; calcium oxalate crystals in rosette aggregates, monoclinic prisms or crystal-fibers, the individual crystals 0.010 to 0.018 mm. in diameter; starch grains numerous, spherical, ellipsoidal bi-convex, polygonal or irregular, and single or compound, from 0.002 to 0.010 mm. in diameter; fragments of whitish cork with strongly lignified walls; stone cells mostly single, occasionally in small groups, the individual cells 0.050 to 0.180 mm. in length, the walls being very thick and strongly lamellated; occasional fragments of wood with long wood-fibers from 0.015 to 0.020 mm. in width, the walls being slightly lignified and from 0.003 to 0.008 mm. in thickness, and associated with tracheæ possessing simple and bordered pores. Mix 1 Gm. of powdered *Granatum* with 100 Cc. of distilled water, macerate it with occasional agitation for about one hour and filter; a light yellow filtrate should be obtained. Upon the addition of a drop of ferric chloride T. S. to 10 Cc. of this filtrate a bluish-black precipitate should be produced. Upon the addition of from 40 to 50 Cc. of lime water to another portion of 10 Cc. of the filtrate, an orange-brown flocculent precipitate should be produced. Ash not exceeding 16 percent. *Granatum* should not be kept longer than one year.

Grindelia.—The dried leaves and flowering tops of *Grindelia camporum*, Greene, or *Grindelia cuneifolia* Nuttall, or *Grindelia squarrosa* (Pursh) Dunal (Fam. Compositæ), with not more than 10 percent. of stems and other foreign matter. Stems with attached branches and terminated with resinous flower-heads; stems cylindrical, not exceeding 2 mm. in diameter, light yellow or rose colored, with alternate leaf-scars, occasionally with basal portions of leaves, occasionally more or less irregularly flexuous and coated with resin especially at the nodes; leaves usually separate and more or less broken and varying in shape when entire from oblong and lanceolate to oblanceolate-spatulate and cuneate-spatulate, 1 to 7 cm. in length, mostly sessile or amplexicaule and more or less sharply serrate or even spinosely toothed, pale

yellow to yellowish-green, very resinous, somewhat coriaceous and brittle; bracts of flowering branches almost entire and usually more or less spreading; heads more or less resinous, viscid, many-flowered, either conical-urceolate or depressed-urceolate, involucre 5 to 20 mm. in breadth, composed of numerous imbricated bracts with more or less recurved tips; ray florets yellow, ligulate and pistillate; disk florets yellow, tubular and perfect; pappus of 2 or 3 mostly unequal, linear awns about the length of the disk florets; disk achenes more or less ovoid or oblong, more or less compressed or triquetrous, and either bi-auriculate or broadly unidentate or with a broad truncate, corky-thickened summit; odor balsamic; taste aromatic and bitter, resinous. Powder: Yellowish-brown; consisting of numerous fibrous fragments made up of tissues of the stem, the most prominent being the tracheæ with annular and spiral thickenings or marked with simple or bordered pores, associated with numerous narrow, strongly lignified wood-fibers; pith cells more or less tabular and containing a layer of protoplasm in which are embedded numerous spheroidal granules; fragments of epidermis of leaves very characteristic and showing more or less polygonal areas containing large chloroplastids, and the large colorless, basal cells of the multicellular, glandular hairs; pollen grains spherical 0.035 mm. in diameter, spinose, and in section showing three pores.

Guaiacum.—In irregular, or in large, nearly homogeneous masses, occasionally in more or less rounded or ovoid tears, enclosing fragments of vegetable tissues; externally greenish-gray-brown, the fractured surface having a glassy lustre, the thin pieces being translucent and varying in color from yellowish to reddish-brown; odor balsamic; taste slightly acrid. Guaiac should melt at from 80° to 90° C. It is readily soluble in alcohol, ether, chloroform, creosote, and in solutions of the alkalis or of hydrated chloral T. S. It is sparingly soluble in carbon disulphide or benzene.

Guarana.—Powder: Light pinkish-brown; consisting mostly of irregular masses of parenchyma containing more or less altered starch grains; unaltered starch grains occasional, varying from spherical and polygonal to ellipsoidal and broadly ovoid, from 0.010 to 0.025 mm. in diameter; occasional fragments with narrow elongated sclerenchymatous cells, the walls being thick, yellowish and non-lignified. Add 0.001 Gm. of powdered Guarana to a slide, upon which a drop of hydrochloric acid has previously been placed, add a drop of gold chloride T. S. and allow the mixture to stand for a few minutes. Beginning at the edge of the mount, crystals of caffeine gold chloride should be separate in the form of orthorhombic plates and needles, the latter usually occurring in spheroidal aggregates and finally forming branching groups.

Humulus.—Hops may include not more than 2 percent. of stems, leaves and other foreign matter. Scales "imbricated". Color described as strong and characteristic, becoming disagreeable and valerian-like on aging. Ash not exceeding 8 percent. Hops should be dried at a temperature not exceeding 70° C. and should be kept in air-tight containers protected from the light.

Hydrastis.—The drug may include not more than 2 percent. of stems, leaves and other foreign matter. Rhizome horizontal or oblique, sub-cylindrical

and usually more or less flexuous, 1 to 5 cm. in length and 2 to 7 mm. in diameter, occasionally with stem-bases; externally yellowish or grayish-brown, marked by numerous stem scars and more or less annulate from scars of bud-scales, otherwise deeply longitudinally wrinkled, and on the under and lateral portions arise numerous long, filiform roots which are easily detached; fracture short, waxy; internally of a deep yellow color and consisting mostly of parenchyma enclosing an interrupted circle of small fibro-vascular bundles; odor distinct; taste bitter. Powder: Brownish-yellow; starch grains numerous, from 0.002 to 0.015 mm. in diameter, being mostly single, nearly spherical, and either free or in the parenchyma cells; fragments with the tissues of the fibro-vascular bundles mostly associated with starch-bearing parenchyma; tracheæ, with simple and bordered pores and occasionally spiral thickenings, and associated with short sclerenchymatous fibers possessing thin walls with simple pores; occasional fragments of tabular cork cells with reddish-brown walls.

Hyoscyamus.—The dried leaves and flowering or fruiting tops of *Hyoscyamus niger* Linné (Fam. Solanaceæ). Usually much wrinkled, with numerous stems and with the flowering or fruiting tops intermixed; leaves when entire attaining a length of 25 cm. and a breadth of 10 cm., ovate or ovate-oblong, very inequilateral, the lower with short petioles, the upper sessile, summits acute, margins coarsely and angularly 1- to 4-toothed or lobed, grayish-green, glandular-hairy, particularly on the lower surfaces; flowers nearly sessile with an urn-shaped unequally 5-toothed calyx and a campanulate corolla which in the fresh state is of a yellowish color; fruit a 2-locular pyxis, and enclosed in a large urn-shaped calyx with 5 acute teeth; odor heavy, distinct; taste somewhat bitter and acrid. Stems from 3 to 7 cm. in length and from 2 to 5 mm. in thickness, nearly cylindrical or somewhat compressed, longitudinally wrinkled and hairy. Powder: Grayish-green; calcium oxalate crystals usually in the form of 4- to 6-sided, isolated prisms, sometimes in twins, from 0.015 to 0.025 mm. in length, also occurring in spherical aggregates either isolated or attached to the prismatic crystals, sometimes in rosette aggregates, 0.020 mm. in diameter, and occasionally in sphenoidal micro-crystals; hairs numerous, of two kinds; the non-glandular 2 to 10 cells in length, the glandular with a 1- to many-celled head and a 1- to 4-celled stalk; fragments of epidermis with broadly elliptical stomata, 0.030 to 0.035 mm. in length and with 3 to 4 neighboring cells; fragments of tracheæ with simple or bordered pores and spiral or reticulate thickenings, also associated with libriform sclerenchymatous fibers having thin, porous walls and showing little or no lignification. The presence of the leaves of *Hyoscyamus muticus* Linné in either the crude or powdered drug of *Hyoscyamus* may be determined by the characteristic branching non-glandular hairs occurring on both the stems and leaves of *H. muticus*. Ash not exceeding 30 percent.

Ipecacuanha.—Ipecac may contain not more than 10 percent. of stems. Rio Ipecac: In cylindrical pieces, curved and sharply flexuous, occasionally branched, from 3 to 15 cm. in length, and from 2.4 to 4 mm. in thickness; externally dark brown, closely annulated with thickened, incomplete rings, and usually exhibiting transverse fissures with vertical sides; fracture of bark short,

of wood tough, bark very thick, light brown, easily separable from the yellowish-white wood; odor very slight, peculiar, the dust sternutatory; taste bitter and nauseous, somewhat acid. Stems cylindrical, attaining a length of 10 cm. and a thickness of 2 mm., dark brown, finely longitudinally wrinkled and with a few elliptical scars. *Carthagenia Ipecac*: Cylindrical or slenderly fusiform, more or less tortuous, from 3 to 12 cm. in length, and from 4 to 6.5 mm. in thickness; externally grayish-brown, the annulations usually not so numerous as in *Rio Ipecac*, occasionally transversely fissured and with circular scars of roots; bark 2 mm. in thickness, dark brown, smooth, somewhat horny, and easily separable from the light brown wood. Stems attaining a length of 10 cm. and a thickness of from 2 to 3 mm., cylindrical, somewhat zigzag, due to the prominent nodes with their elliptical stem-scars, grayish or dark brown and longitudinally wrinkled; bark thin. Powder: Light brown; starch grains numerous, 1- to 4- or more compound, the individual grains spherical or polygonal, from 0.003 to 0.017 mm. in diameter; calcium oxalate in raphides from 0.015 to 0.040 mm. in length, few; tracheids with bordered pores and oblique slit-like pores. The stem bark shows a few, slightly elongated stone cells, from 0.030 to 0.045 mm. in length, with thick lignified walls and simple, branching pores. Ash not less than 1.8 percent. nor more than 4.5 percent.

Jalapa.—Fusiform, irregularly ovoid or pyriform, upper end more or less rounded, lower end slightly tapering, the large roots often incised or cut into pieces; from 4 to 15 cm. in length, from 12 to 60 mm. in diameter; externally dark brown, longitudinally wrinkled or furrowed and with numerous lenticels; hard, compact, not fibrous; when broken internally, dark brown, mealy or waxy, bark 1 to 2 mm. in thickness, outer bundles separated from outer cortical layer by a distinct brown cambium zone; odor slight but peculiar, smoky and sweetish; taste sweetish and acid. Powder: Light brown; starch grains numerous, single or 2- to 3-compound and more or less swollen, ellipsoidal or ovoid with concentric or excentral lamellæ and radiating clefts or fissures from 0.003 to 0.035 mm. in diameter, calcium oxalate in rosette aggregates from 0.010 to 0.035 mm. in diameter; tracheæ short, wide, with simple or bordered pores; laticiferous vessels with yellowish-brown, resinous masses. Ash not exceeding 6.5 percent.

Kino.—The spontaneously dried juice. In small, angular fragments, usually considerably less than 15 mm. in diameter, varying in color from a dark reddish-brown to reddish-black, brittle; when crushed upon a slide and examined under the microscope, the angular fragments are more or less translucent with a glass-like, conchoidal surface, the thinner pieces having a yellowish-red or deep brownish-red color, the pieces often being marked by nearly parallel, curved or straight lines; inodorous; taste very astringent, when masticated it colors the saliva pinkish. Powder: Of a dark brick-red or ochre color, upon the addition of water the sharp angular fragments should assume a deep, rich red color and become more or less rounded and separate into innumerable, small, granular particles among which are included a large number of rod-shaped bacteria. Upon mounting powdered *Kino* in alcohol, the fragments at first assume a deep red color, then mostly dissolve, leaving a number of small, colorless granules and indistinguishable, cellular fragments.

Kino is only partly soluble in cold water, and not less than 40 percent. should be soluble in boiling water, the latter upon cooling and filtering should show a faintly acid reaction, give a dark green precipitate with ferric chloride T. S., and a reddish-violet color with alkalis. Alcoholic extractive not less than 45 percent. Moisture content not more than 12 percent. Ash not exceeding 3 percent.

Krameria.—The drug may include not more than 5 percent. of stems. The family name changed from "Krameriaceæ" to Leguminosæ. Peruvian Rhatany: It consists of a knotty, several- to many-headed crown with numerous branching roots; the latter rarely attaining a length of 50 cm. and usually less than 1 cm. in thickness, cylindrical, somewhat tapering, flexuous or wavy and very flexible, externally light reddish-brown or brownish-red, more or less marked with dark, scaly cork, especially in the upper portion, otherwise nearly smooth, somewhat longitudinally wrinkled and devoid of transverse fissures; fracture of bark slightly fibrous, of wood tough and splintery, the pinkish-brown bark less than one-third of the radius, the wood yellowish or pinkish-white and finely radiate; inodorous; wood nearly tasteless, bark astringent. Savanilla Rhatany and Para Rhatany: Roots usually separate, less flexuous and tapering than those of Peruvian Rhatany, and usually not exceeding 12 mm. in thickness; externally purplish-brown or chocolate brown and marked with numerous fissures, fracture less tough than that of Peruvian Rhatany, internally the bark and wood darker, the bark about two-fifths or more of the radius and more astringent than that of Peruvian Rhatany. Powder: Reddish-brown; starch grains, single or 2- to 4-compound, the individual grains spherical, ellipsoidal, or plano-convex and sometimes with a central, radial or star-like cleft, from 0.003 to 0.035 mm. in diameter, bast-fibers more or less wavy in outline with very much attenuated ends and with non-lignified walls; tracheæ with simple or bordered pores associated with numerous wood-fibers which are narrow spindle-shaped and with thick, porous, slightly lignified walls; numerous cellular fragments with yellowish or reddish-brown walls; calcium oxalate in monoclinic prisms, 0.010 to 0.100 mm. in length, few, or frequently absent. Macerate 2 Gm. of powdered Rhatany with 10 Cc. of alcohol, with occasional stirring for one hour and filter it. The deep reddish colored filtrate obtained should yield a dark brownish-red precipitate and a deep orange-red filtrate upon the addition of an excess of alcoholic lead acetate T. S., this latter filtrate should yield no precipitate upon the further addition of a drop or two of alcoholic lead acetate T. S., and should give an olive-brown solution having a purplish fluorescence upon the addition of a drop or two of ferric chloride T. S. Aqueous extractive not less than 9 percent. Ash not exceeding 5 percent.

Lactucarium.—Treat Lactucarium with boiling water and filter; the filtrate should be clear while hot, but on cooling it should become turbid; the filtrate should not be colored blue by iodine T. S. (absence of starch) and should also become clear upon the addition of ammonia water or alcohol. An alcoholic solution of Lactucarium should give not more than a faint green color upon the addition of a drop of ferric chloride T. S. (absence of tannin). Powder: Grayish-brown to dark brown, consisting almost entirely of irregular fragments without any cellular structure; when mounted in hydrated chloral T. S.,

the fragments should become clear, showing a granular ground mass, and from this should separate numerous rod-shaped crystals and broad, monoclinic prisms as well as coarse, rosette-shaped, crystal-like masses, that polarize light. Dry the drug at a temperature not exceeding 70° C. for powdering. Ash not exceeding 10 percent.

Leptandra.—*Leptandra* may include not more than 5 percent. of stems and other foreign matter. Rhizome usually of horizontal growth nearly cylindrical, somewhat branched, from 4 to 10 cm. in length and from 4 to 13 mm. in diameter; externally grayish-brown to dark reddish-brown, annulate from circular scars of bud-scales, upper surface with short stem remnants; occasionally with buds, and numerous circular stem-scars, from the under and lateral portions arise numerous coarse roots; fracture very tough and woody, branches readily separable from the main rhizome; internally bark rather thin, dark brown and resinous, wood about the same thickness as the bark, light brown and porous, pith large, more or less hollow, the color being similar to that of the bark; nearly odorless, taste very bitter and acid. Roots from 1 to 10 cm. in length and from 1 to 2 mm. in diameter; externally dark brown to purplish-brown, smooth and faintly longitudinally wrinkled: fracture short; internally with a thick brownish-black bark and small light brown central cylinder. Powder: Dark brown and yellowish white; odor strong, penetrating; containing numerous irregular fragments of vegetable tissue, many of them being colored pink or violet upon the addition of hydrated chloral T. S., starch grains numerous, to some extent isolated but mostly in the parenchymatous cells, the individual grains being nearly spherical or more or less polygonal and from 0.002 to 0.008 mm. in diameter; fragments of woody tissues with tracheæ and wood-fibers, tracheæ with spiral thickenings, or with simple or bordered pores, wood-fibers with thick lignified walls, with simple pores or with bordered pores, resembling tracheids; fragments of parenchyma containing a light brown or brownish-black resin, the latter frequently closely coherent with the starch grains in the cells thus preventing the separation of the individual starch grains; in hydrated chloral T. S. mounts, occasional elongated cells with a lemon-yellow oily substance may sometimes be seen.

Limonis Cortex.—The outer rind of the fresh ripe fruit of *Citrus medica* Limonum (Risso) Hooker filius (Fam. Rutaceæ). The outer, lemon-yellow or dark yellow layer recently separated by grating or paring and consisting of an epidermal layer, numerous parenchyma cells containing yellow chromoplastids and large oil-reservoirs with globules of the volatile oil; odor highly fragrant, distinct; taste pungently aromatic. Under the microscope sections of the fresh fruit when mounted in fixed oils, show an epidermal layer composed of small tabular cells, a hypodermal layer containing numerous plastids, a mesocarp with colorless, thin-walled parenchyma and large, elliptical oil reservoirs; parenchyma cells containing a layer of granular protoplasm adhering to the walls and occasionally membrane crystals of calcium oxalate, which are irregularly polygonal in shape, polarize light strongly and from 0.015 to 0.025 mm. in diameter.

Linum.—Flaxseed may include not more than 3 percent. of other harmless fruits, seeds and foreign matter. Ovate, or oblong-lanceolate, flattened,

obliquely pointed at one end, 3 to 5 mm. in length; externally chestnut-brown, very smooth and shiny, the raphe extending as a distinct, light yellow ridge along one edge; easily cut with the finger-nail, internally olive-green, oily; odor slight; taste mucilaginous and oily. Under the microscope transverse sections when mounted in hydrated chloral T. S. show an epidermis with a mucilaginous layer from 0.010 to 0.015 mm. in thickness, covered by a very thin layer of cutin which is often more or less broken; two layers of parenchyma which overlie a continuous ring of stone-cells having yellowish, porous walls and rather large lumina; a pigment layer, the cells having a reddish-brown content; an endosperm consisting of from 6 to 10 rows of cells, surrounding the two large plano-convex cotyledons; the cells of both the endosperm and the cotyledons contain a fixed oil and aleurone grains, the latter being from 0.003 to 0.020 mm. in diameter. Powder: Lemon-yellow and light brown, consisting chiefly of large, oily globules and irregular fragments of endosperm and seed-coat; the seed-coat is characterized by the tabular pigment cells filled with a reddish-brown, insoluble content and by the somewhat elongated stone cells with yellowish walls; mounts made from material from which the fixed oil has been removed, show aleurone grains from 0.003 to 0.020 mm. in diameter, both free and in the cells of the endosperm and embryo. Linseed or Flaxseed Meal: Light olive-brown with reddish-brown fragments; fragments very coarse and the cellular tissues are the same as those of the powder. Powdered Linseed or Flaxseed and Linseed Meal or Flaxseed Meal should be recently prepared and free from unpleasant or rancid odor, and should be kept in tightly closed containers, to which a few drops of carbon tetrachloride or chloroform should be added from time to time to prevent the attack by insects. Boil 1 Gm. of the fat-free Linseed or Flaxseed Powder or Meal, with 50 Cc. of water, cool and filter; the filtrate should show, on the addition of iodine T. S., not more than a faint blue color. The ground or powdered drug upon extraction with petroleum benzin should yield not less than 30 percent. of a fixed oil, 98 percent. of which should be saponifiable. Ash not exceeding 6 percent.

Lobelia.—Family name changed from "Campanulaceæ" to "Lobeliaceæ." Stems cylindrical, coarsely and irregularly furrowed, yellowish-green, occasionally purplish and with numerous spreading hairs; leaves alternate, usually more or less broken, when entire, laminae ovate or oblong, 2 to 9 cm. in length, obtusely toothed or irregularly serrate-denticulate, the teeth with a yellowish-brown gland-like apex, pale green and with scattered, bristly hairs; petiole either wanting or 1 mm. in length; flowers in long racemes with short pedicels, calyx tube ovoid, 5-toothed, corolla tubular, 3 to 4 mm. in length, 5-parted, the upper 2-lobed portion cleft nearly to the base; stamens with anthers united above into a curved tube enclosing the bifid stigmas; capsules ovoid or ellipsoidal, 5 to 8 mm. in length, light brown, wholly inferior and enclosing numerous brownish, oblong and coarsely reticulate seeds; odor slight; taste strongly acrid. Powder: Dark green, odor irritating; fragments of seed-coat composed of more or less polygonal cells with thick, yellowish walls; isolated, non-glandular hairs elongated-conical, 0.300 to 0.600 mm. in length; fragments of stem with tracheæ showing annular or spiral thickenings or simple pores associated with narrow wood-fibers, the walls of the latter being rather thin, more or less lignified

and porous; fragments of epidermis of leaf with elliptical stomata, 0.025 mm. in length, and usually with 3 or 4 neighboring cells; pollen grains nearly spherical, 0.015 to 0.030 mm. in diameter. Ash not exceeding 8 percent.

Lupinum.—A granular powder, bright yellowish-brown, having the characteristic odor and taste of hops; becoming darker in color, disagreeable and valerian-like in odor on aging, when it is unfit to use. Under the microscope the glandular trichomes are somewhat globular or ellipsoidal, 0.150 to 0.200 mm. in diameter, consisting of a single layer of secreting cells assuming the form of a shallow cup, from the inner surface of which the cuticle has been separated by the secreted yellowish-brown oleoresin. Ash changed from "not more than 10 percent." to "not exceeding 16 percent."

Lycopodium.—The spores of *Lycopodium clavatum* Linné (Fam. Lycopodiaceæ), with not more than 2 percent. of impurities. Under the microscope the spores are spherical tetrahedrons, 0.025 to 0.040 mm. in diameter; in section they vary from plano-convex to triangular, the outer wall or exosporium being extended in the form of slight, irregular projections, giving the edge a ciliate appearance, and the surface of the spore a reticulate appearance, the reticulations being polygonal and formed of straight sides; when viewed so that the rounded surface of the spore is on the under side, the upper surface is characterized by a distinct, triangular marking, being the edges of the three straight surfaces, extending from the center of the spore to near the outer edge. *Lycopodium* should show very few, if any, pollen grains of species of Pine, the latter being 0.040 to 0.070 mm. in diameter, and consisting of three parts, a central, convex, generative cell separating the two spherical cells or wings which are blackish, due to the inclusion of air. Ash changed from "not exceeding 5 percent." to "not exceeding 3 percent."

Matricaria.—The dried flower-heads of *Matricaria Chamomilla* Linné (Fam. Compositæ), with not more than 5 percent. of stems and foreign matter. Flower-heads composed of a few white ray florets and numerous yellow disk florets on a conical, more or less hollow receptacle, the latter being 3 to 10 mm. in breadth; disk flowers tubular, perfect, and without a pappus; ray flowers 10 to 20, pistillate, corolla white, 3-toothed, and 4-veined, usually reflexed, involucre hemispherical, composed of 20 to 30 imbricated, oblanceolate, and pubescent scales; peduncles light green to brownish-green, longitudinally furrowed, more or less twisted and attaining a length of 2.5 cm.; achenes somewhat obovoid and faintly 3- to 5-ribbed, pappus none or only a slight membranous crown; odor pleasant, aromatic; taste aromatic and bitter. Ash not exceeding 13 percent.

Mentha Piperita.—Leaves more or less crumpled and frequently detached from the stems; stems quadrangular, 1 to 2 mm. in diameter, nearly glabrous except for a few scattered deflexed hairs; leaves when entire ovate-oblong to oblong-lanceolate, petioles 4 to 15 mm. in length, slightly pubescent, laminæ 1 to 9 cm. in length, acute and sharply serrate, light green to purplish-brown, upper surfaces nearly glabrous, lower surfaces glandular-hairy especially on the veins; flower-whorls in oblong or oval spikes which are usually compact, or somewhat interrupted at the base, 1 to 1.5 cm. in breadth, rounded at the summit, and in fruit attaining a length of 3 to 7 cm.; bracts oblong-lanceolate, very acuminate,

7 mm. in length; calyx tubular, equally 5-toothed, pubescent and glandular-punctate, often dark purplish in color; corolla tubular-campanulate, 4-cleft, 3 mm. in length and often light purple; stamens 4, short and equal; nutlets ellipsoidal, 0.5 mm. in diameter, blackish-brown; odor pungent, characteristic; taste aromatic, pungent, followed by a cooling sensation.

Mentha Viridis.—Leaves more or less crumpled and mixed with a large proportion of the light brown or purplish-colored stems occasionally with their characteristic opposite branches; stems distinctly quadrangular 1 to 3 mm. in width, nearly glabrous; leaves when entire oblong- or ovate-lanceolate, unequally serrate, nearly sessile or with a petiole less than 5 mm. in length, of a bright green color and somewhat glandular-hairy on the under surfaces; flowers in clusters arranged oppositely and in more or less interrupted or crowded, lanceolate, acute or acutish spikes; bracts subtending the flower clusters linear-lanceolate, subulate, 7 to 10 mm. in length; calyx tubular, 5-toothed, glandular-punctate and somewhat pubescent near the teeth; corolla whitish or light brown; stamens extending beyond the corolla tube; odor slightly pungent, characteristic; taste aromatic, characteristic but not followed by a cooling sensation.

Moschus.—Known in commerce as Tonquin or Tibetan Musk. Usually in small irregular granules, not more than 2 mm. in thickness, blackish, with a few light brown fragments and becoming somewhat grayish on aging; shiny and somewhat oily; odor peculiar, penetrating, powerful and persistent; taste aromatic and bitterish. Add a few granules of Musk to 2 Cc. of water in a watch crystal and stir with a glass rod, a light brown solution should be obtained. The undissolved portion should consist of irregular fragments containing a finely granular substance, numerous rod-like bacteria and occasionally the hyphæ of a fungus. Add a drop of iodine T. S. to a slide containing a few granules of Musk and examine under the microscope; none of the particles should be colored blue or bluish-black (absence of starch). Add a few granules of Musk to 2 Cc. of alcohol contained in a watch crystal; the grains should sink to the bottom, and upon stirring with a glass rod, a pale brown, slightly cloudy solution should be obtained, leaving a somewhat oily stain upon the upper portion of the watch crystal as the alcohol evaporates; the undissolved portion or residue should resemble that obtained with the aqueous mixture, except in that the particles should be less disintegrated. Add a few granules of Musk to 2 Cc. of chloroform in a watch crystal; the grains should float on the surface and upon stirring with a glass rod, the solution should remain nearly colorless, and as it evaporates there should separate around the particles a small quantity of a whitish oily or fatty substance. Not less than 50 percent. of Musk should be soluble in water, the solution being of a dark brown color with a strong, aromatic odor and a slightly acid reaction. Not less than 10 percent. of Musk should be soluble in alcohol, the solution being of a light yellowish-brown color becoming slightly turbid upon the addition of water. Musk, when dried to constant weight in a desiccator over sulphuric acid, should not lose more than 15 percent. of moisture.

Myristica.—Ovoid or ellipsoidal, 20 to 30 mm. in length and about 20 mm. in thickness; externally light brown to dark brown, consisting of the reticulately furrowed perisperm; the broad end with a large, circular, upraised scar from

which arises a furrow extending to the chalaza; easily cut, the surface having a waxy lustre and mottled by reason of the light brown perisperm penetrating into the yellowish-brown endosperm; a longitudinal section through the middle of the large scar shows a small irregular cavity with the more or less shrunk remains of the embryo, and usually containing a growth of mold; odor slightly aromatic, taste agreeably aromatic. Powder: Dark reddish-brown; consisting of irregular, yellowish-brown or brownish-black fragments; fragments of perisperm yellowish-brown with large, circular or elliptical oil reservoirs containing a volatile oil, small, thin-walled parenchyma cells and occasional spiral tracheæ; parenchyma cells of the endosperm more or less polygonal and filled with starch grains and aleurone grains; starch grains single or compound, the individual grains being spherical, plano-convex or polygonal, from 0.003 to 0.020 mm. in diameter and colored blue with iodine T. S. (distinction from starch grains in mace, which are colored yellowish-red; mounts in hydrated chloral T. S. show numerous globules of a fixed oil which later may separate in the form of rod-like crystals; mounts in any of the fixed oils show the separation of spheroidal aggregates of crystals of the fixed oil which polarize light strongly. The powder made from "lined" Nutmeg shows, under the microscope, upon the addition of water containing 25 percent. of sulphuric acid, the immediate separation of crystals of calcium sulphate in the form of small needles or short rods which do not polarize light. Ash not exceeding 5 percent. Broken and wormy kernels should be rejected.

Myrrha.—A gum-resin obtained from one or more species of *Commiphora* (Fam. Burseraceæ). Powder: Yellowish-brown; 0.001 Gm. of the powder, when added to a slide containing a drop of one of the fixed oils and examined under the microscope, shows numerous angular fragments varying in color from pale yellow to yellowish-brown; hydrated chloral T. S. produces an intensification in the color of the yellowish fragments; the addition of iodine T. S. to the powder previously mounted in hydrated chloral T. S. may show the presence of a few starch grains varying in shape from spherical, polygonal, and narrowly ellipsoidal to somewhat pear-shaped, from 0.010 to 0.035 mm. in diameter; when mounted in phloroglucinol T. S. and hydrochloric acid the powder may show a few fragments of lignified tissues consisting of either sclerenchymatous fibers, or of small groups of stone cells, the individual cells of the latter with very thick, porous walls and from 0.015 to 0.050 mm. in length. Statements about emulsion with water, its insolubility and non-swelling in water, and the nitric acid test on an alcoholic solution omitted. Not less than 35 percent. of Myrrh should be soluble in alcohol. Ash not exceeding 8.5 percent.

* *Nux Vomica*.—Orbicular, nearly flat, occasionally irregularly bent, 10 to 30 mm. in diameter, 4 to 5 mm. in thickness; externally grayish or greenish-gray, covered with appressed hairs giving it a silky lustre, hilum indicated by a circular scar at the center of one of the flattened sides, and connected with the micropyle by a ridge; the micropyle very hard when dry; internally showing a thin and hairy seed-coat and a large grayish-white endosperm at one end of which is embedded a small embryo, with 2 broadly ovate 5- to 7-nerved cotyledons; inodorous; taste persistently bitter. Powder: Light gray; consisting chiefly of thick-walled, endosperm cells containing globules of a fixed oil and

a few small aleurone grains, and fragments of strongly lignified, non-glandular hairs, the walls of the latter possessing large, circular, or long, slit-like pores. In the tissues of the adhering pulp occur a few small, nearly spherical starch grains. The color test with potassium dichromate and sulphuric acid omitted. Ash not exceeding 3.5 percent.

Opii Pulvis.—Temperature for drying changed from “not exceeding 85° C.” to “not exceeding 70° C.” Light brown, consisting chiefly of yellowish-brown to brownish-red, more or less irregular and granular fragments varying from 0.015 to 0.150 mm. in diameter; a few fragments of strongly lignified thick-walled, 4- to 5-sided or narrowly elongated, epidermal cells of the poppy capsule; and very few fragments of tissues of poppy leaves, poppy capsules, and *Rumex* fruits.

Opium.—Obtained from *Papaver somniferum* Linné and its variety *album* De Candolle (Fam. *Papaveraceæ*) with not more than 5 percent. of the capsules and leaves of the poppy plant, *Rumex* fruits, and other foreign matter. In more or less rounded, mostly somewhat flattened masses of variable size, but usually about 8 to 15 cm. in diameter; externally grayish-brown, covered with fragments of poppy leaves and with some fruits of a species of *Rumex*, adhering from packing; more or less plastic when fresh, becoming hard and brittle on keeping; internally dark brown interspersed with lighter areas, somewhat lustrous; odor characteristic, narcotic; taste bitter, characteristic.

Pepo.—Defined as the “dried” seeds of cultivated varieties of *Cucurbita Pepo* Linné (Fam. *Cucurbitaceæ*), with not more than 5 percent. of other harmless seeds. Broadly elliptical or ovate, 15 to 23 mm. in length and 2 to 3 mm. in thickness; externally yellowish-white, very smooth, occasionally with thin, transparent fragments of adhering pulp, and with a shallow groove parallel to and within 1 mm. of the margin; fracture short, seed coat consisting of a white coriaceous outer layer and a membranous inner layer occasionally of a dark green color; embryo whitish, straight, with a small conical hypocotyl and two plano-convex cotyledons; slightly odorous when contused; taste bland and oily. Under the microscope sections show an outer epidermal layer consisting of palisade-like cells, the radial walls attaining a length of 1 mm.; the outer walls usually being torn off so that it appears as though the seeds were covered with very long hairs; a sub-epidermal layer consisting of 5 to 12 rows of cells with slightly thickened, lignified and porous walls; a layer of strongly lignified stone cells, elliptical in outline and about 0.075 mm. in length; a single layer of small cells resembling those of the sub-epidermal layer; several rows of spongy parenchyma cells with characteristic reticulate markings and separated from each other by large intercellular spaces; several layers of parenchyma cells, the inner layer being more or less collapsed and bounded on the inside by a single epidermal layer, the cells having rather thick walls; the perisperm cells are usually more or less collapsed and the endosperm consists of a single layer of cells filled with small aleurone grains; the cotyledons consist of thin-walled, isodiametric, elongated or palisade-like cells containing a fixed oil and numerous small aleurone grains.

Petroselinii Fructus.—The dried ripe fruits of *Petroselinum sativum* Hoffmann (Fam. *Umbelliferae*), with not more than 5 percent. of foreign seeds and other

vegetable matter. Mericarps usually separated, ovoid crescent shaped, 2 to 3 mm. in length, 1 mm. in diameter; externally grayish-brown becoming grayish or brownish on aging, having 5 yellowish, filiform, prominent ribs, alternating with the coarsely roughened furrows; in transverse section nearly hemispherical, the commissural surface with 2 vittæ, or oil-tubes, the dorsal surface usually with a single vitta, occasionally 2 vittæ, in the grooves between the primary ribs; endosperm large, oily, enclosing a small embryo; odor and taste characteristic and distinctly aromatic, especially when bruised. Under the microscope sections show an epidermal layer with thick, cuticularized walls having numerous small centrifugal projections; several layers of small, thin-walled parenchyma cells, being usually considerably collapsed; a single large brown elliptical vittæ or oil-tube between each of the primary ribs and surrounded by a layer of comparatively large, yellowish-brown, tangentially elongated cells; a single fibro-vascular bundle more or less surrounded by a few or occasionally numerous, sclerenchymatous fibers; inner epidermis of narrow, thin-walled, elongated cells closely cohering with the brownish tabular cells of the seed-coat; commissural surface usually with 2 large vittæ, a very few stone cells and showing a slight separation of pericarp and seed-coat; endosperm of polygonal, thick-walled, parenchyma cells containing fixed oil and numerous small aleurone grains usually containing a small rosette aggregate of calcium oxalate. The vittæ usually contain yellowish oil globules or a resin-like mass adhering to the walls, and occasionally are divided by a radial wall. Powder: Grayish-brown, mostly of large, irregular fragments; cells of endosperm with aleurone grains, each usually containing a rosette aggregate of calcium oxalate, 0.003 to 0.007 mm. in diameter; fragments with light yellow vittæ and the yellowish-brown cells of the pericarp; fragments with narrow tracheæ and more or less lignified sclerenchymatous fibers.

Physostigma.—Defined as the "dried" seeds. Oblong or ellipsoidal, somewhat compressed reniform, 15 to 30 cm. in length, 10 to 15 mm. in thickness; externally reddish or chocolate brown, smooth, somewhat wrinkled near the brownish-black groove, the latter being 2 mm. in width and extending almost the entire length of the convex edge and in which is found frequently the remains of the white membranous funiculus, the margins of the seed coat on both sides of the groove somewhat elevated, of a yellowish-red or brownish-red color and somewhat thickened; embryo large, white, with short hypocotyl and two concave-convex cotyledons; taste at first starchy, afterwards acid. Powder: Grayish-white; starch grains numerous, from 0.005 to 0.150 mm. in diameter, ellipsoidal or somewhat reniform, and usually with a distinct cleft and frequently with radiating or irregular fissures; fragments of seed coat with very thick, reddish-brown cells being either palisade-like shaped, or very irregular and resembling stone cells, but the walls are not lignified; an occasional fragment with tracheæ showing reticulate thickenings. Ash not exceeding 3 percent.

Pilocarpus.—The dried leaflets of *Pilocarpus Jaborandi* Holmes, in commerce known as *Pernambuco Jaborandi*, or of *Pilocarpus microphyllus*, Stapf, known in commerce as *Maranham Jaborandi*, (Fam. Rutaceæ), with not more than 5 percent. of the rachis (stalks) bearing the leaflets and stems of the same plant. *Pernambuco Jaborandi*: Leaflets when entire, oval, oblong, or elliptical, 4

to 10.5 cm. in length and 2 to 4 cm. in breadth and with short, stout petiolules; summits more or less rounded or acute and emarginate; bases rounded or acute and mostly unequal; margins, entire and narrowly revolute; very smooth, shiny, coriaceous and glandular-punctate; upper surface grayish to brownish-green, mid-ribs mostly depressed, under surfaces yellowish- or greenish-brown and slightly pubescent on the prominent midvein; peculiarly aromatic when crushed; taste bitterish, becoming somewhat pungent and having a sialagogue effect. *Maranham Jaborandi*.—Leaflets rhomboidally oval to obovate or elliptical, 1.5 to 5 cm. in length and 1 to 3 cm. in breadth, the lateral ones nearly sessile, the terminal ones on margined petiolules, 0.5 to 1.5 cm. in length; of a nearly uniform grayish or yellowish-green color, rather thin but otherwise resembling *Pernambuco Jaborandi*. Under the microscope transverse sections show the upper epidermal cells with a yellowish layer of cutin, from 0.005 to 0.010 mm. in thickness; palisade cells, 1 to 3 rows deep, being filled with chloroplastids; among the palisade cells occur large, nearly circular, oil secretion reservoirs 0.080 to 0.150 mm. in diameter; the dorsal pneumatic layer, 10 to 20 rows in depth, the cells occasionally containing rosette aggregates of calcium oxalate from 0.010 to 0.025 mm. in diameter; distributed in the center of the leaf, are the collateral fibro-vascular bundles each surrounded by a more or less interrupted circle of several rows of thick-walled, slightly lignified bast-fibers; tracheæ associated with strongly lignified wood-fibers; among the cells of the lower epidermis occur numerous stomata. On surface view the stomata are broadly elliptical, 0.025 to 0.040 mm. in length, being uniformly smaller in *Maranham Jaborandi*. Upon both surfaces of *Pernambuco Jaborandi* occur a number of non-glandular, one-celled hairs, more or less bent or curved, from 0.080 to 0.500 mm. in length, thick-walled and with numerous, slight, centrifugal projections. Powder: Dark green or greenish-brown, epidermal cells on surface view 5- to 6-sided, stomata broadly elliptical, from 0.020 to 0.040 mm. in length, usually with four neighboring cells; fragments of fibro-vascular bundles showing tracheæ with simple or bordered pores or spiral thickenings, associated with thick-walled and strongly lignified wood-fibers; bast-fibers few, walls thick and only slightly lignified; calcium oxalate in rosette aggregates, 0.010 to 0.025 mm. in diameter; fragments of laminae showing large, oil secretion reservoirs and usually containing one or more globules of an oily substance; non-glandular hairs, having thick walls usually more or less broken, are occasionally found. Ash not exceeding 7 percent.

Piper.—It may include not more than 2 percent. of stems and foreign matter. Nearly globular, 3.5 to 6 mm. in diameter, epicarp very thin, easily separable from the sarcocarp; externally blackish-brown or grayish-black, coarsely reticulate; 1-locular, 1-seeded; seed whitish, hollow, adhering to the pericarp; odor aromatic, slightly empyreumatic; taste aromatic and very pungent. Powder: A mixture of blackish-brown fragments of the pericarp and whitish fragments of the endosperm and embryo; starch grains spherical or somewhat angular; 0.001 to 0.003 mm. in diameter, mostly in the polygonal cells of the endosperm; stone cells of the epicarp varying from nearly isodiametric or palisade-like, to long tapering or somewhat shoe-shaped, with thick, porous walls and large lumina frequently containing a reddish-brown pigment; stone cells of the endocarp

unevenly thickened, the outer walls being usually rather thin, and the lumina usually filled with a reddish-brown substance; oil cells with suberized walls and containing a yellowish oil, in which occasionally separate monoclinic prisms of piperine. Non-volatile ether extract, not less than 6 percent; starch, not less than 25 percent. Ash not exceeding 7 percent. Ash insoluble in diluted hydrochloric acid, not exceeding 2 percent.

Podophyllum.—Defined as the "dried rhizome and roots." *Podophyllum* should yield, by the method given under *Resina Podophylli*, not less than 3 percent. of resin which should conform to the requirements and tests for Resin of *Podophyllum*. Horizontal, nearly cylindrical, jointed, compressed on the upper and lower surfaces, sometimes branched; in pieces from 3 to 20 cm. in length, the internodes 2 to 9 mm. in diameter; externally dark brown, longitudinally wrinkled or nearly smooth with irregular, somewhat V-shaped scars of scale leaves, nodes annulate, upper portion marked with large, circular, depressed stem-scars and sometimes with buds or stem-bases; at or near the nodes on the lower portion, occur numerous root-scars or roots from 2 to 7 cm. in length and about 2 mm. in thickness; fracture short; internally, bark light brown, wood with small, yellowish, vascular bundles, pith large and white; odor slight; taste sweetish, disagreeably bitter and acid. Under the microscope a transverse section shows an outer layer of one or two rows of reddish-brown cells; parenchyma of cortex and pith with numerous, single, spherical, polygonal, or 2- to 6-compound starch grains, or rosette aggregates of calcium oxalate; vascular bundles 24 to 34 arranged in a circle between cortex and pith. Powder: Light brown and with a pronounced and characteristic odor; starch grains numerous, spherical, polygonal or 2- to 6-compound, the individual grains from 0.003 to 0.015 mm. in diameter, calcium oxalate crystals few, in rosette aggregates from 0.050 to 0.080 mm. in diameter, and occasionally in raphides 0.030 to 0.090 mm. in length; tracheæ with simple pores or reticulate thickenings; fragments of starch-bearing parenchyma and reddish-brown cork cells. Ash not exceeding 3 percent.

Prunus Virginiana.—To consist of the "stem-bark." Usually in transversely curved pieces from 2.5 to 8 cm. in length and 0.5 to 4 mm. in thickness; outer surfaces light brown or greenish-brown, smooth, except for numerous lenticels from 3 to 4 mm. in length; inner surfaces light brown, longitudinally striate and occasionally fissured; fracture short, granular; odor distinct, bitter-almond-like, when macerated in water; taste astringent, aromatic, and agreeably bitter. Under the microscope sections show a tendency for the separation in radial segments or bands of the phloem tissues from the rather broad medullary rays; periderm usually of a few layers of cells; outer bark from young twigs with 1 or 2 nearly continuous layers of stone cells, the latter being of very irregular shape, often branching and with thick, lamellated, porous walls, medullary rays extending as more or less scythe-shaped groups from the cambium to the outer bark, from 1- to 10-cells in width, some of the cells occasionally being modified to stone cells; in between the medullary rays occur numerous small groups of stone cells, resembling those of the outer bark and occasionally modified to sclerenchymatous fibers; calcium oxalate mostly in crystal-fibers consisting of monoclinic prisms, 0.015 to 0.040 mm. in diameter, also in rosette aggregates,

0.010 to 0.020 mm. in diameter; starch grains numerous, occurring in the medullary rays and parenchyma. Powder: Light brown; bast-fibers and stone cells with thick, strongly lignified walls; crystal-fibers with monoclinic prisms and rosette aggregates of calcium oxalate, from 0.020 to 0.040 mm. in diameter; starch grains nearly spherical, from 0.003 to 0.004 mm. in diameter.

Pyrethrum.—Defined as the "dried" root. Nearly cylindrical, slightly tapering, usually in pieces, 2.5 to 10 cm. in length, 5 to 20 mm. in diameter; externally dark brown, deeply longitudinally furrowed and somewhat wrinkled, occasionally bearing short, tough, hair-like rootlets, crown more or less annulate and occasionally tufted with coarse fibers or with long, soft-woolly nearly straight, 1-celled hairs; fracture short; bark dark brown with 1 or 2 circular rows of resin ducts, closely adhering to the light yellow, radiate, porous wood; in the medullary rays of which occur 1 to 3 rows of resin ducts; odor distinct; taste sweetish, pungent, very acrid, tingling and producing a strong sialagogue effect. Powder: Light to dark brown; consisting of numerous spherical or irregular masses of inulin, the nature of which is especially seen with polarized light, and lignified fragments of the woody tissues and stone cells associated with cork; inulin in spherical granules or irregular masses, 0.010 to 0.100 mm. in diameter; which is not affected upon the addition of iodine T. S., tracheæ with simple pores and reticulate or scalariform thickenings, usually associated with wood parenchyma and with few or no wood-fibers; stone cells in groups resembling those of fruits and seeds, the cells more or less tabular in outline, and with thick, yellowish, porous walls; cork in yellowish-brown or dark brown fragments. Ash not exceeding 5 percent.

Quassia.—Jamaica Quassia: Usually in chips, raspings or shavings, occasionally in billets; yellowish-white or bright yellow, with a few light gray pieces somewhat coarsely grained; fracture tough, fibrous; odor slight; taste bitter. Under the microscope sections of Jamaica Quassia show large tracheæ either single or in groups of 2 to 5, the walls being marked by numerous, small bordered pores, and the contents being often of a yellowish color; medullary rays mostly 1 to 5 cells wide and from 10 to 20 rows deep; calcium oxalate in crystal-fibers near the medullary rays, in 4- to 6-sided prisms, from 0.006 to 0.030 mm. in length; wood-fibers with thin walls and oblique pores; starch grains few, spherical or ellipsoidal, 0.010 to 0.015 mm. in diameter. Surinam Quassia: The crude drug and microscopic sections closely resemble the Jamaica variety; tracheæ usually single or in pairs, sometimes in groups of 3 or 4; medullary rays in narrower and larger groups than in the Jamaica variety, from 1 to 4 cells wide and from 10 to 30 rows deep; calcium oxalate crystals few or entirely wanting and distinguishing this variety from Jamaica Quassia.

Rhamnus Purshiana.—The dried bark of the trunk and branches of *Rhamnus Purshiana* De Candolle (Fam. Rhamnaceæ). Usually in flattened or transversely curved pieces, occasionally in quills, bark 1 to 5 mm. in thickness; outer surface dark brown or brownish-red, longitudinally ridged, often nearly covered with grayish or whitish lichens, bearing small blackish apothecia, sometimes with numerous lenticels; and occasionally with mosses; inner surface light yellow, light brown, or reddish-brown, longitudinally striate, turning red when moistened with solutions of the alkalies; fracture short, with projections of bast-

fibers in the inner bark; in cross section inner bark shows diagonal or curved medullary rays, forming converging groups, the outer bark showing yellowish groups of stone cells which are especially apparent on moistening the freshly cut surface with phloroglucinol T. S. and hydrochloric acid; odor distinct; taste disagreeable, bitter, slightly acid. Under the microscope a transverse section shows an outer yellowish-brown or reddish-brown corky layer consisting of 10 to 15 or more rows of cells; stone cells in outer bark in tangentially elongated groups of 20 to 50 cells, the walls being very thick and finely lamellated; medullary rays 1 to 4 cells wide, 15 to 25 cells deep, the contents being colored red upon the addition of solutions of the alkalies to the sections; bast-fibers in tangentially elongated groups in the inner bark, the walls being* thick and strongly lignified; crystal-fibers around the bast-fibers with individual crystals from 0.008 to 0.015 mm. in length, parenchyma with spheroidal starch grains about 0.003 to 0.008 mm. in diameter, or with calcium oxalate either in rosette aggregates or prisms from 0.010 to 0.020 mm. in diameter. Add 0.100 Gm. of powdered Cascara Sagrada to 10 Cc. of hot water, shake the mixture occasionally until cold, filter it, and add sufficient water to make 10 Cc.; on the addition of 10 Cc. of ammonia water to this liquid it should be colored an orange yellow. Macerate 0.100 Gm. of powdered Cascara Sagrada with 10 drops of alcohol, boil the mixture with 10 Cc. of water, when cold filter it and shake the filtrate with 10 Cc. of ether; a yellow ethereal solution should separate. Shake 3 Cc. of this ethereal solution with 3 Cc. of ammonia water; the separated ammoniacal solution still should possess, on diluting with 20 Cc. of water, a distinct, yellowish-red color. Powder: Light brown to olive brown, showing the characteristic elongated groups of bast-fibers associated with crystal-fibers, the crystals in the latter being in the form of monoclinic prisms, from 0.008 to 0.015 mm. in length; stone cells in large groups, the cells having thick and finely porous walls; fragments of parenchyma and medullary ray cells colored red upon the addition of solutions of the alkalies; starch grains either free or in parenchyma cells, the individual grains being somewhat spheroidal, from 0.003 to 0.008 mm. in diameter; calcium oxalate in monoclinic prisms or rosette aggregates from 0.010 to 0.020 mm. in diameter; occasional fragments of reddish-brown cork. Ash not exceeding 8 percent.

Rheum.—In subcylindrical, barrel-shaped, conical pieces known in commerce as "rounds," or in plano-convex pieces known in commerce as "flats" or irregular pieces, frequently with a perforation; hard and moderately heavy; attaining a length of 17 cm. and a diameter of 10 cm., or cut in pieces of variable form and size; outer surface yellowish-brown, mottled, with alternating, longitudinal striæ of grayish-white parenchyma and reddish or brownish medullary rays, small stellate groups of fibro-vascular tissue and occasionally reddish-brown cork patches, smooth and sometimes covered with a bright, brownish-yellow powder; fracture uneven and granular, presenting a characteristic, mottled appearance; odor aromatic, characteristic; taste slightly bitter, astringent; gritty when chewed, tingeing the saliva yellow. Under the microscope sections of Rhubarb show numerous thin-walled parenchymatous cells containing either a large number of starch grains or a single rosette aggregate of calcium oxalate; scattered among the parenchyma are stellate groups of compound

fibro-vascular bundles, the latter composed of narrow medullary rays separating the wedges, having large tracheæ in the outer part and separated by a prominent cambium from an internal phloem or sieve; among the grayish-white parenchyma of the inner bark occur narrow, yellowish-brown, irregular medullary rays. Not more than 15 percent. of Rhubarb should have a hollow or dark central area. Powder: Bright orange-yellow to yellowish-brown; becoming red with alkalis; calcium oxalate in rosette aggregates, mostly 0.050 to 0.100 mm. in diameter, occasionally attaining a diameter of 0.150 mm.; starch grains numerous, somewhat spherical, single or 2- to 4-compound, each with a single cleft, from 0.002 to 0.020 mm. in diameter; tracheal fragments few, mostly reticulate, occasionally spiral. Boil 0.100 Gm. of powdered Rhubarb with 10 Cc. of an aqueous solution of potassium hydroxide, (1 in 100) allow it to cool, filter, acidulate the filtrate with hydrochloric acid and shake it with 10 Cc. of ether; on standing, the ethereal layer should be colored yellow. On shaking this ethereal solution with 5 Cc. of ammonia water, the latter should be colored cherry-red (presence of emodin) and the ethereal layer should remain yellow (presence of chrysophanic acid). Diluted alcohol extractive, not less than 30 percent. Ash not exceeding 13 percent.

Sabal.—The partially dried, ripe fruits of *Serenoa serrulata* (Roemer and Shultes) Hooker filius (Fam. Palmæ). Ellipsoidal or ovoid, occasionally compressed, 1.5 to 3 cm. in length, 1 to 1.5 cm. in diameter; externally brownish-black to bluish-black, smooth and somewhat oily, with a few large, somewhat angular depressions due to the contraction of the inner layer on drying, summit marked by scar of style, and base either with a short stalk or stem-scar; epicarp and sarcocarp together forming a thin coriaceous shell enclosing a hard but thin endocarp which is externally reddish-brown and somewhat fibrous as is also the inner layer of the sarcocarp; inner layer of endocarp smooth, enclosing a hard ellipsoidal or ovoid, somewhat flattened, reddish-brown seed; odor pronounced, aromatic; taste sweetish, aromatic, slightly acid. Powder: Yellowish-brown, consisting of large, irregular fragments; parenchyma cells of sarcocarp containing a yellowish-brown or brownish-red, amorphous substance; whitish fragments of endosperm, the walls being considerably thickened and with large pores; stone cells occasional, nearly colorless, more or less tabular or irregular in shape, 0.125 mm. in length, walls 0.015 mm. in thickness and with numerous simple or branching pores.

Sanguinaria.—The dried rhizome "and roots" of *Sanguinaria canadensis* "collected after the death of the foliage" is omitted. Of horizontal growth, occasionally branching, more or less cylindrical, somewhat flattened, from 2 to 7 cm. in length, and from 5 to 15 mm. in diameter; externally dark brown, slightly annulate, with a few stem scars on the upper surface and numerous more or less broken filiform roots and root-scars on the lower surface; fracture short and somewhat waxy, brownish-red, occasionally yellowish-white, with numerous, small, circular, yellowish fibro-vascular bundles within about 1 mm. of the epidermis, pith very large; odor slight; taste persistently acrid and bitter. Under the microscope transverse sections of the rhizome show an outer layer of a single row of thin-walled epidermal cells, a cortex of 10 to 15 rows of thin-walled parenchyma cells containing numerous starch grains, or a small amount

of fixed oil; a zone of cambium, most of which is interfascicular; a narrow circular zone of small collateral fibro-vascular bundles, separated from each other by parenchyma; pith large, consisting of starch-bearing parenchyma cells; latex cells containing a red or orange colored secretion, either isolated or connected into irregular chains and distributed among the parenchymatous cells of the middle bark and pith; sections treated with glycerin show in the secretion cells, after 24 hours, spheroidal aggregates of crystals which strongly polarize light. Powder: Brownish-red, sternutatory; starch grains numerous, 0.003 to 0.020 mm. in diameter, being mostly single, seldom 2- to 3-compound, the individual grains nearly spherical or ovoid, sometimes more or less plano-convex, somewhat resembling those of wheat starch in outline but which polarize light more strongly; numerous fragments of short latex cells with reddish-brown resinous masses; tracheal fragments few, having numerous transverse slit-like pores.

Santalum Rubrum.—Usually in the form of a coarse powder, of a brownish-red or dark saffron color and nearly inodorous and tasteless. Under the microscope it shows numerous wood-fibers which are mostly irregular in outline, with sharply pointed and occasionally forked ends, the individual fibers from 0.300 to 0.750 mm. in length, the walls being very thick, porous, yellowish, unevenly thickened and strongly lignified, and the lumina being filled with a fine, granular, protoplasmic content; occasional tracheæ with simple or bordered pores and filled with light lemon-yellow, resinous masses; occasionally fragments showing medullary ray cells in narrow elliptical groups 1 cell wide and 3 to 6 cells deep; also occasional groups of crystal-fibers with calcium oxalate in the form of monoclinic prisms, from 0.010 to 0.020 mm. in diameter. Mounts in hydrated chloral T. S. are of a deep, rich, red color. Add 0.500 Gm. of Red Saunders to 10 Cc. of Alcohol; the solution should become distinctly red. Add 0.500 Gm. of Red Saunders to 10 Cc. of ether; the solution should assume an orange-yellow color and when held in a bright light should show a distinct, greenish fluorescence. Add 0.005 Gm. of Red Saunders to 10 Cc. of water; the solution should remain clear and colorless. Ash not exceeding 3 percent.

Sarsaparilla.—The dried root of *Smilax medica* Chamisso and Schlechtendal, known in commerce as Mexican Sarsaparilla; or *Smilax officinalis* Kunth, or an undetermined species of *Smilax*, known in commerce as Honduras Sarsaparilla; or *Smilax papyracea* Duhamel, known in commerce as Para Sarsaparilla; or *Smilax ornata* Hooker filius known in commerce as Jamaica Sarsaparilla (Fam. Liliaceæ). Mexican Sarsaparilla: In loose bundles, or pressed into bales, single bundles attaining a length of 60 cm. and composed of 20 to 35 folded roots attached to a crown with one or more stout stems; roots 3.5 to 6 mm. in diameter; externally grayish-brown to dark brown, minutely hairy, longitudinally furrowed, the furrows containing more or less of a blackish earth; fracture tough, fibrous; internally light brown with a more or less shrunken, mealy or sometimes horny cortex surrounding the porous central cylinder, pith distinct; nearly inodorous; taste mucilaginous, somewhat sweetish and acrid. The woody, knotty crown with portions of the overground stems should be removed. Honduras Sarsaparilla: In more or less compact, cylindrical bundles, attaining a length of 55 cm. and a diameter from 8 to 15 cm., consisting of the long, folded roots bound together by roots of the same plant; roots 2 to 6

mm. in diameter; externally dark or reddish-brown, longitudinally furrowed, the furrows usually free from soil; fracture fibrous; internally consisting of a grayish-white or dark brown cortex, a light yellow and porous central cylinder and a whitish pith; taste mucilaginous and slightly acid. *Para Sarsaparilla*: In very compact, cylindrical bundles, attaining a length of 1 M. and a diameter of 20 cm., closely bound with the stem of a vine and with the ends evenly trimmed; the roots otherwise resembling those of *Honduras Sarsaparilla*. *Jamaica Sarsaparilla*: In more or less compact and somewhat flattened bundles, 30 to 45 cm. in length, 10 to 15 cm. in width, consisting of the folded roots loosely bound with roots of the same plant; roots 2 to 5 mm. in diameter; externally grayish-brown to reddish-brown, longitudinally wrinkled, more or less furrowed and bearing numerous coarse fibrous rootlets; taste slightly sweetish and bitterish. Under the microscope transverse sections of all of the commercial varieties of *Sarsaparilla* show an epidermal layer with basal portions of root hairs; a hypodermis composed of several layers of strongly lignified cells, the walls being uniformly thickened except in Mexican *Sarsaparilla* in which the inner walls are only slightly thickened; a cortex composed of numerous parenchyma cells mostly containing starch, some containing resin or raphides of calcium oxalate; and endodermis of a single layer of strongly lignified cells, the walls being uniformly thickened except in Mexican *Sarsaparilla* in which the outer walls are only slightly thickened; a central cylinder composed of radial bundles connected with sclerenchymatous fibers, the tracheæ being large and oval and the phloem in small groups at the periphery of the bundle; and a pith composed of starch-bearing parenchyma. Powder: Light grayish-brown to dark grayish-brown; starch grains numerous 0.003 to 0.023 mm. in diameter, spherical, or biconvex or spherical-tetrahedral, single, or 2- to 4-compound, and frequently with a central elliptical cleft; calcium oxalate in raphides, 0.006 to 0.035 mm. in diameter, occurring singly or in groups; cells of the hypodermis and endodermis with lemon-yellow or reddish-yellow porous walls and in the case of Mexican *Sarsaparilla* showing an uneven or irregular thickening, the individual cells, 0.080 to 0.500 mm. in length; fragments of tracheæ with simple and bordered pores or scalariform or reticulate thickenings associated with sclerenchymatous fibers having rather thin, very slightly lignified and porous walls. Ash not exceeding 10 percent.

Sassafras.—The drug may include not more than 2 percent. of adhering wood. In irregularly transversely curved or quilled pieces, 1 to 15 cm. in length, 1 to 4 mm. in thickness; outer surface orange-brown, nearly smooth and marked with more or less irregular ridges; inner surface light to dark reddish-brown, obscurely short-striate; fracture short with a thin reddish-brown corky layer and a yellowish-white inner bark; odor aromatic; taste slightly mucilaginous, astringent, aromatic and somewhat pungent. Powder: Light reddish-brown, containing numerous starch grains and prominent, characteristic bast-fibers; starch grains either single or 2- to 4-compound, the individual grains being more or less spherical or polygonal and frequently with a distinct cleft, 0.003 to 0.020 mm. in diameter, some of the swollen or altered grains attaining a diameter of 0.030 mm.; bast-fibers spindle-shaped, occasionally very irregular in outline, with sharply pointed ends, from 0.150 to 0.400 mm. in length, 0.025 mm. in

diameter, and with very thick, strongly lignified walls, the lumina being frequently nearly obliterated; parenchyma cells containing either starch grains or irregular yellowish-red masses of tannin and becoming bluish-black upon the addition of ferric chloride T. S., fragments of wood few, with large, thin-walled tracheæ marked by simple pores and associated with rather thin-walled wood-fibers. Ash not exceeding 30 percent.

Scammonia Radix.—The dried root of *Convolvulus Scammonia*, Linné (Fam. Convolvulaceæ), yielding when assayed by the process given below, not less than 8 percent. of total resins of Scammony Root. Cylindrical or somewhat tapering, from 10 to 25 cm. in length, 1 to 4.5 cm. in thickness; externally grayish to reddish-brown; usually distinctly twisted, deeply longitudinally furrowed, marked by distinct root scars, otherwise nearly smooth except for the lenticels and abraded cork, the upper portion terminated usually by a number of short stem branches; hard and heavy; fracture tough, irregular with projecting wood-fibers; internally somewhat mottled showing yellowish, porous wood-wedges separated by whitish parenchyma containing starch and resin; bark thin; odor slight, resembling that of jalap; taste very slightly sweet becoming slightly acrid. Under the microscope sections of Scammony Root show a corky layer consisting of 2 to 10 rows of cells with thin, yellowish-brown lignified walls; an outer cortex with numerous stone cells occurring singly or in small groups, the walls being moderately thick, porous and not strongly lignified; parenchyma with numerous starch grains and monoclinic prisms of calcium oxalate; fibro-vascular bundles numerous, circular or elliptical with a well developed wood consisting of large tracheæ surrounded with slightly lignified wood-fibers; phloem and sieve prominent and in which are included large resin ducts; the parenchyma both in and surrounding the bundles more or less collapsed and containing either starch or calcium oxalate crystals. Powder: Light grayish-brown; starch grains from 0.003 to 0.018 mm. in diameter, mostly single, occasionally 2- to 4-compound, the grains showing occasionally a central cleft; calcium oxalate crystals numerous, in monoclinic prisms from 0.010 to 0.045 mm. in length, fragments of leptome or sieve with yellowish-brown resin cells; tracheæ mostly with reticulate thickenings and simple or bordered pores and associated with short wood-fibers with prominent oblique pores; stone cells of variable shape and varying from 0.040 to 0.110 mm. in length, the walls being from 0.006 to 0.012 mm. in thickness, slightly lignified and traversed with prominent often branching pores; lignified cork cells relatively few.

Scilla.—The fleshy, inner scales of the bulb of the white variety of *Urginea maritima* Linné Baker (Fam. Lilaceæ) cut into pieces and carefully dried. In irregular, more or less curved, somewhat flattened and translucent pieces, 0.5 to 5 cm. in length, yellowish-white, nearly smooth and shiny with slight projections of fibro-vascular bundles, brittle when dry and somewhat flexible when damp; odor slight; taste bitter and acrid. Under the microscope sections of the scales show on the upper and lower surfaces a thin-walled, epidermal layer, a mesophyll of nearly isodiametric or slightly elongated thin-walled cells, and occasionally showing in alcoholic or glycerin mounts spheroidal aggregates of a carbohydrate; numerous more or less rectangular cells containing mucilage and bundles of raphides of calcium oxalate, the latter from 0.075 to 1.0 mm. in

length; fibro-vascular bundles few and isolated, with spiral or reticulate tracheæ. Occasionally some of the parenchyma cells contain a few, somewhat spherical starch grains. Powder: Light yellow, with a tendency to cake in moist atmosphere, consisting of very irregular fragments; single crystals and bundles of long raphides of calcium oxalate numerous; fragments of thin-walled, colorless parenchyma, frequently with dark intercellular spaces due to the inclusion of air; fragments with spiral or reticulate tracheæ occasional. Ash not exceeding 8 percent.

Senega.—The roots may include not more than 5 percent. of stems and other foreign matter. Usually in broken pieces, when entire, slenderly conical, more or less tortuous, somewhat branched, 3 to 15 cm. in length and 2 to 10 mm. in thickness and bearing a few rootlets; crown knotty with numerous buds and short stem-bases; externally brownish-yellow, the crown rose-tinted, longitudinally wrinkled, frequently marked by a keel; fracture short, wood pale yellow, usually eccentrically developed, odor peculiar, penetrating, taste sweetish, afterwards acid. Under the microscope transverse sections usually show a characteristic eccentric development of wood, the central cylinder varying in outline from elliptical or ovate to irregularly fan-shaped, and being surrounded by an unevenly developed cortex being thickest outside the broadest strands of wood, and where the wood wedges are narrow and the medullary rays very broad, the cortical parenchyma occupies a very narrow zone of the cross-section; in older roots a corky layer of 4 or 5 rows of tangentially elongated, light yellowish or yellowish-brown cells; outer bark of about 20 rows of cells on one side of the root and only 10 or less on the other, the cells having slightly thickened walls and containing a colorless or pale yellowish amorphous substance, which is liberated in the form of large globules on the addition of a drop of potassium hydroxide T. S.; inner bark, the cells in radial rows, consisting of parenchyma, small groups of sieve tissue, and medullary rays, the latter 1 to 3 cells wide, all the cells in this zone show a collenchymatous thickening of the walls and contain an amorphous substance similar to that found in cells of the outer bark; woody layer of tracheæ with bordered pores, wood-fibers with oblique, simple pores, tracheids, and medullary rays, the latter being rather indistinct and resembling the wood-fibers; tissues of the central layer of wood colored yellowish or reddish-brown on the addition of a drop of potassium hydroxide T. S. Powder: Yellowish-gray to light yellowish-brown, odor penetrating, slightly sternutatory; consisting of a mixture of fragments of parenchyma containing oily globules and wood-fibers with tracheæ; wood-fibers, non-lignified and with oblique, simple pores, from 0.175 to 0.250 mm. in length; tracheæ with simple and bordered pores and about 0.175 mm. in length; medullary ray cells somewhat lignified and with large simple pores. Extract 10 Gm. of powdered Senega by means of a Soxhlet apparatus, using 50 Cc. of ether to which 2 drops of hydrochloric acid have previously been added. Continue the extraction for 4 or 5 hours and then add sufficient ether to make the liquid measure 50 Cc. Take 25 Cc. of this solution and evaporate it on a water-bath to dryness, the residue should not weigh less than 0.300 Gm. and upon dissolving the residue with 10 Cc. of chloroform, transferring it to a test-tube and pouring 5 Cc. of sulphuric acid beneath the solution, a reddish-brown color should be produced

at the zone of contact and the sulphuric acid should show a slightly green fluorescence after the mixture has stood for twenty-four hours. If 10 Cc. of the original ethereal solution be poured in a beaker in which previously has been placed 10 Cc. of water and the mixture warmed on a water-bath until the ether has been evaporated, the aqueous solution, upon filtering and adding a few drops of ferric chloride T. S., should become a bright pink-purple. Ash not exceeding 5 percent.

Senna.—The drug may include not more than 10 percent. of stem tissues, pods, seeds, and other impurities. Alexandria Senna: Usually entire, sometimes more or less broken, leaflets inequilaterally lanceolate or lance-ovate, from 2 to 3.5 cm. in length, from 6 to 10 mm. in breadth, having extremely short, stout petiolules; acutely cuspidate, entire, subcoriaceous brittle, pale green or grayish-green, sparsely and obscurely hairy, especially beneath, the hairs appressed; odor characteristic; taste somewhat mucilaginous and bitterish. Pods few, broadly elliptical, somewhat reniform, dark green, thin and membranous. India Senna: Leaflets usually entire, from 2 to 5 cm. in length, and from 6 to 14 mm. in breadth, usually more abruptly pointed than those of Alexandria Senna, yellowish-green and smooth above, paler beneath; in odor and taste closely resembling Alexandria Senna. Pods few, elliptical, more or less reniform and from 4 to 5 cm. in length. Powder: Alexandria Senna; light green; non-glandular hairs, 1-celled, conical, often curved, from 0.100 to 0.350 mm. in length, walls thick and papillose; calcium oxalate in rosette aggregates, from 0.009 to 0.010 mm. in diameter, and in 4- to 6-sided prisms, about 0.015 mm. in length, usually in crystal-fibers; stomata broadly elliptical, about 0.020 mm. in long diameter. In India Senna the powder is slightly darker green than that of Alexandria Senna and the hairs are relatively fewer. Mix 0.5 Gm. of powdered Senna with 10 Cc. of a solution of potassium hydroxide in alcohol (1 in 10), boil the mixture for about 2 minutes, dilute it with 10 Cc. of water and filter. Then acidify the filtrate with hydrochloric acid, shake it with ether; remove the ethereal layer and shake it with 5 Cc. of ammonia water; the latter should be colored yellowish-red. Ash not exceeding 12 percent. Ash insoluble in hydrochloric acid not exceeding 3 percent.

Serpentaria.—The drug may include not more than 10 percent. of the stems. Rhizome oblique, subcylindrical, more or less curved, from 10 to 30 mm. in length and from 1 to 2 mm. in diameter; externally dark brown, upper portion with short stem-bases, from lower and lateral portions, and numerous, long, thin, nearly straight, yellowish-brown roots; fracture short; internally yellowish-white, wood with broad, eccentric wedges; odor terebinthinate; taste bitter, aromatic. Under the microscope transverse sections of the rhizome show an outer layer of cork cells; a cortex of 10 to 15 rows of parenchyma, inner bark with strongly lignified bast-fibers either single or distributed in a more or less interrupted circle; a xylem of broad wood wedges separated by broad medullary rays about 8 cells wide, the walls being strongly lignified and with numerous simple pores; pith eccentric, composed of polygonal cells, the walls being lignified and porous. Starch in the cells of cortical parenchyma, medullary rays and pith. The root in transverse section shows a compact, 4- to 6-rayed stele, and a large starch-bearing cortical area. The stem in transverse section

shows an interrupted circle of 6 to 10 fibro-vascular bundles; a cortex with a prominent, continuous ring of strongly lignified cells, and a few non-glandular hairs. Powder: Grayish-brown; starch grains numerous, single and 2- to 4-compound, the individual grains being more or less spherical or plano-convex, and frequently with a central cleft; from 0.003 to 0.014 mm. in diameter; lignified elements numerous, consisting of tracheæ, wood-fibers, medullary ray cells and pith cells; a few non-glandular hairs of the stem are occasionally present.

Sinapis Alba.—The drug may include not more than 5 percent. of other harmless seeds and other foreign matter. Subglobular, from 1.5 to 2.5 mm. in diameter; testa yellowish, nearly smooth; embryo yellowish, oily, with 2 large cotyledons; inodorous, taste mildly pungent, acrid. Powder: Light yellowish or pale brownish-yellow, developing a slight odor when moistened; consisting mostly of tissues of the embryo, containing small aleurone grains and a fixed oil, the latter forming in large globules on the addition of hydrated chloral T. S.; fragments of seed-coat comparatively few, nearly colorless with small, characteristic stone cells and large epidermal cells, the outer walls being mucilaginous. White Mustard does not yield allyl isothiocyanate upon distillation with steam (distinction from Black Mustard). Starch not exceeding 2.5 percent. Starch test of U. S. P. VIII omitted. Ash not exceeding 9 percent.

Sinapis Nigra.—The drug may include not more than 5 percent. of other harmless seeds and other foreign matter. Ellipsoidal or irregularly spheroidal, from 1 to 1.6 mm. in diameter; testa deep reddish-brown, sometimes yellowish-brown and with a grayish tinge, minutely pitted or reticulate; embryo greenish-yellow or dark yellow, oily, with 2 large cotyledons; odor when dry, slight, on moistening very irritating; taste strongly pungent, acrid. Powder: Light brown or greenish-brown; on moistening developing a strong, pungent, irritating, characteristic odor; consisting mostly of tissues of the embryo, the cells containing small aleurone grains and a fixed oil, the latter forming in large globules on the addition of hydrated chloral T. S.; fragments of seed-coat conspicuous, with large polyhedral, dark yellow areas, enclosing small yellowish stone cells each of the latter with a dark lumen. The powder should contain few or no starch grains. Black mustard upon distillation with steam yields allyl isothiocyanate (distinction from White Mustard). Starch not more than 2.5 percent. Starch test of U. S. P. VIII omitted. Ash not exceeding 9 percent.

Spigelia.—The rhizome and roots may include not more than 10 percent. of stems and other foreign matter. Rhizome horizontal or slightly oblique, more or less flexuous, somewhat branched, from 1.5 to 5 cm. in length, from 2 to 5 mm. in diameter; externally dark brown, slightly annulate with scars of bud scales, the upper surface knotty from approximate stem-bases, bearing cup-shaped scars; from the lower and lateral portions arise numerous long, rather coarse, sparingly branched, brittle roots; fracture short, internally differentiated into three nearly equal zones of pith, wood and bark; odor slightly aromatic; taste bitter, pungent. Few, if any, of the roots should exhibit thin, terminal portions with the bark stripped from the slender strands of wood; stems usually attached to the upper portions of the rhizome nearly cylindrical, attaining a length of 6 cm. and a diameter of 3 mm., light grayish-brown to purplish-brown, nodes

annulate, marked by opposite leaf-scars. Under the microscope transverse sections of the rhizome show a dark brown, more or less exfoliated epidermal layer; a cortex composed of 10 to 15 rows of starch-bearing parenchyma; a distinct zone of sieve tissue from 0.075 to 0.150 mm. in width; a compact woody area composed of tracheæ and tracheids which are hardly distinguishable from each other, both kinds of vessels being marked with bordered pores; an internal sieve closely resembling the sieve in the bark; and a pith composed of fairly uniform, nearly polygonal, thin-walled cells, more or less filled with small starch grains. Cystoliths and stone cells are both absent (distinction from *Ruellia ciliosa* Pursh. [Fam. Acanthaceæ]). Transverse sections of the root show a rather large cortex, the cells of which are more or less filled with small starch grains and a central stele of 6 or 8 radial fibro-vascular bundles which in the older roots are united by a strong development of lignified cells. The stem in transverse section is distinguished from the rhizome by a narrower woody zone, the tracheæ having spiral thickenings, and by a nearly uninterrupted circle of non-lignified bast-fibers in the bark. Powder: Grayish-brown; starch grains relatively numerous, frequently relatively few, spherical or slightly angular, from 0.002 to 0.006 mm. in diameter; fragments containing lignified tracheæ and tracheids conspicuous; fragments of tracheæ with spiral thickenings relatively few; bast-fibers few, very long, non-lignified, occasional fragments of the reddish-brown epidermal cells. Ash not exceeding 10 percent.

Staphisagria.—The drug may include not more than 2 percent. of foreign vegetable matter. Irregularly triangular, flattened, or somewhat tetrahedral, one side being convex, from 4 to 7 mm. in length, from 3 to 6 mm. in breadth; externally dark brown, becoming lighter with age, and coarsely reticulate; easily cut, showing a somewhat light brown oily endosperm, enclosing a small embryo at the pointed end; odor slight, disagreeable; taste intensely bitter and acrid. Under the microscope transverse sections show an outer layer of nearly tabular, thick-walled, non-lignified cells, some being extended centrifugally, and forming the reticulations of the seed-coat; 2 or 3 rows of parenchyma cells with more or less irregular thin walls; a thin layer of very small, thick-walled cells with numerous, lattice-like or reticulate pores; endosperm large, composed of polygonal cells enclosing small aleurone grains and fixed oil, the latter forming in large globules on the addition of hydrated chloral T. S.

Stillingia.—When entire, terete, unequally tapering, rarely branched, attaining a length of 40 cm., from 0.5 to 3 cm. in diameter, usually in pieces; externally reddish-brown, longitudinally wrinkled; fracture very fibrous, externally, the bark light reddish-brown, thick, spongy, finely fibrous, with numerous resin cells and easily separable from the porous, radiate wood; odor distinct; taste bitter, acrid and pungent. Powder: Pinkish-brown or light reddish-brown; starch grains numerous, from 0.005 to 0.035 mm. in diameter, mostly single, very variable shape, and usually with a central cleft, numerous fragments, with more or less tabular secretion cells, containing a reddish-brown, amorphous, resinous substance; fragments of tracheæ mostly with simple pores and associated with wood-fibers, the walls being very thin, lignified and possessing numerous, transverse slit-like, simple pores; bast-fibers long, narrow, the walls thick and slightly lignified; fragments of reddish-brown cork cells; occasionally a crystal of cal-

cium oxalate in rosette aggregates about 0.035 mm. in diameter. Ash not exceeding 5 percent.

Stramonium.—The dried leaves of *Datura Stramonium* Linné, or of *Datura Tatula* Linné, (Fam. Solanaceæ), with not more than 10 percent. of stems and other foreign matter. Usually much wrinkled and either loose or more or less matted together; laminæ when entire from 2 to 30 cm. in length, having petioles from 0.5 to 8 cm. in length; inequilaterally ovate, summits acute or acuminate, bases unequal, one side extending from 3 to 12 mm. below the other, margins sinuate, toothed or angled, the teeth being few, acute or acuminate and with rounded sinuses, frequently with numerous circular perforations which may have become filled with cork; upper surfaces dark green, sparsely hairy, especially upon the veins, lower surfaces light green; odor distinct, heavy and narcotic, taste unpleasant, nauseous; stems cylindrical, usually flattened, attaining a length of 30 cm. and a diameter of 7 mm.; longitudinally wrinkled, occasionally with 1 or more deep furrows, light greenish-brown to purplish-brown. Powder: Brownish-green; upon clearing the fragments with hydrated chloral T. S., numerous elliptical stomata are observed, about 0.025 mm. in length, and surrounded usually with 3 neighboring cells; cells of the mesophyll containing numerous small chloroplastids; calcium oxalate either in rosette aggregates, from 0.010 to 0.020 mm. in diameter, or in rod-like crystals, or in the form of sphenoidal micro-crystals; non-glandular hairs few, characteristic, 2- to 4-celled, attaining a length of 0.500 mm., the basal cell about 0.040 mm. in width, some of the cells more or less collapsed, the outer walls with numerous, slight, centrifugal projections; glandular hairs few, with 1- to 2-celled stalks and usually 2- to 4-celled, glandular heads; tracheæ annular or spiral, fragments of the tracheal wall frequently detached. Stem fragments show large annular or spiral tracheæ which occasionally are thickened, with simple or bordered pores and associated with wood parenchyma; fragments with long, narrow, unequally thickened colenchymatous cells; parenchyma with sphenoidal micro-crystals; wood-fibers occasional; bast-fibers absent. Ash not exceeding 20 percent.

Strophanthus.—The dried, ripe seeds of *Strophanthus Kombé* Oliver, or of *Strophanthus hispidus* De Candolle (Fam. Apocynaceæ), deprived of the long awn. Lance-ovoid, flattened and obtusely edged; from 7 to 20 mm. in length, about 4 mm. in breadth and about 2 mm. in thickness; externally of a light fawn color with a distinct greenish tinge, silky lustrous from a dense coating of closely appressed hairs, (*S. Kombé*), or light to dark brown, nearly smooth and sparingly hairy (*S. hispidus*), bearing on one side a ridge running from about the center to the summit; fracture short and somewhat soft, the fractured surface whitish and oily; odor heavy when the seeds are crushed and moistened; taste very bitter. Under the microscope sections of *Strophanthus Kombé* show a seed-coat composed of several layers of more or less collapsed, thin-walled cells and from the epidermal layer arise numerous non-glandular hairs, which are from 0.200 to 0.800 mm. in length, usually more or less bent, thin-walled, and slightly lignified at the base; in the raphe occurs a tangentially elongated fibro-vascular bundle having numerous spiral tracheæ; endosperm of from 9 to 30 rows of more or less polygonal cells with slightly thickened walls and containing small aleurone grains, a fixed oil and strophanthin, the latter being colored bright green

upon the addition of sulphuric acid; in the center occur two large plano-convex cotyledons having a distinct epidermal layer, a few fibro-vascular bundles and numerous parenchyma cells containing aleurone grains, a fixed oil and occasionally a small amount of strophanthin. Sections of *Strophanthus hispidus* resemble those of *S. Kombé*, the hairs being fewer, the bases of which are more strongly lignified. Powder: Grayish-brown to dark brown; odor distinct; consisting chiefly of thin-walled parenchyma cells and fragments of long, thin-walled hairs, the latter relatively few in *S. hispidus*; mounts made with hydrated chloral T. S. show oil globules; many of the fragments of the endosperm may be colored greenish upon the addition of sulphuric acid. The tests with iodine T. S., ferric chloride T. S. and mercuric potassium iodide T. S., omitted. Ash not exceeding 5 percent.

Sumbul.—The roots of *Ferula Sumbul* (Käuffmann) Hooker filius (Fam. Umbelliferæ). In transverse segments, attaining a length of 10 cm. and a diameter of 7 cm.; externally light brown to dark brown, longitudinally wrinkled and showing in the upper portions a smooth, grayish, epidermal layer, occasionally with the short stem-bases attached; fracture short, fibrous, spongy; internally light yellow or brownish-yellow, arrangement of wood irregular and with yellowish-brown or blackish resinous patches frequently extending over the entire ends of the segments; odor peculiar, musk-like; taste bitter and somewhat aromatic. Powder: Grayish-brown; consisting of numerous, irregular, brownish-black fragments and well defined isolated tracheæ, the latter with distinct end-walls, and mostly with reticulate thickenings and from 0.030 to 0.100 mm. in width, occasional fragments of polygonal epidermal cells with yellowish-brown walls; numerous, nearly colorless, yellowish-brown and reddish-brown fragments consisting of a granular substance in which the cellular structure is not well-defined; long, narrow fragments consisting of more or less collapsed leptome or sieve tissue; occasional fragments of well defined parenchyma with a few nearly spherical starch grains from 0.003 to 0.012 mm. in diameter.

Taraxacum.—The dried rhizome and roots of *Taraxacum officinale* Weber (Fam. Compositæ). Directions for collecting omitted. Cylindrical or somewhat flattened, gradually tapering, usually broken in pieces, from 6 to 15 cm. in length, from 5 to 15 mm. in thickness; externally brown or blackish-brown, longitudinally wrinkled, having numerous root and rootlet-scars; crown simple or branched with numerous leaf-bases showing annulate markings; odor slight or inodorous; taste bitter. Under the microscope sections of the root show a porous, pale yellow wood from 1 to 4 mm. in diameter, surrounded by a light brown bark from 2 to 6 mm. in thickness, the latter composed of concentric layers of laticiferous vessels and sieve tissues, alternating with whitish inulin-bearing parenchyma. The rhizome portions show a small pith. Powder: Light brown; parenchyma cells large, thin-walled and containing irregular masses of inulin; fragments with yellowish-brown laticiferous vessels; tracheæ reticulate; intermediate fibers non-lignified, with irregular, simple and oblique pores. Ash not exceeding 10 percent.

Tragacantha.—The spontaneously dried gummy exudation from the stems of *Astragalus gummifer* Labillardière, or from other Asiatic species of *Astragalus* (Fam. Leguminosæ). In flattened, lamellated fragments varying from ribbon-

shaped bands to long and linear pieces, which may be either straight or spirally twisted, and from 0.5 to 2.5 mm. in thickness; whitish to light brown in color, translucent and horny; fracture short, rendered more easily pulverizable by heating to 50° C.; inodorous; taste insipid, mucilaginous. Under the microscope sections made from *Tragacanth* previously softened in water and mounted in glycerin should show the lamellæ of mucilaginous walls and a few starch grains, the latter being mostly spherical and single, occasionally 2- to 3-compound, the individual grains from 0.003 to 0.017 mm. in diameter and colored blue with iodine. Indian Gum, derived from plants of uncertain origin, upon similar treatment and examination, shows numerous threads of a granular substance, sometimes the hyphæ of a fungus and chains of bacteria, and occasional fragments of a yellowish-brown or reddish-brown color, containing lignified wood-fibers, a few rosette aggregates of calcium oxalate from 0.020 to 0.030 mm. in diameter, and a few spherical starch grains from 0.003 to 0.007 mm. in diameter. Add 1 Gm. of *Tragacanth* to 50 Cc. of distilled water; it should swell and form a smooth, nearly uniform, stiff, opalescent mucilage and should be free from cellular fragments. Indian Gum upon similar treatment forms an uneven mucilage containing a few reddish-brown fragments which are more apparent and on stirring separate in the form of coarse, uneven strings. Shake 2 Gm. of *Tragacanth* with 100 Cc. of water until fully swollen and free from lumps, then add 2 Gm. of powdered sodium borate, and shake the mixture thoroughly until the salt is dissolved; the mucilage should not lose its transparency, nor exhibit any change in consistence, and on pouring should not be slimy or stringy, even after standing 24 hours (absence of foreign gums). Boil 1 Gm. of *Tragacanth* with 20 Cc. of water until a mucilage is formed, then add 5 Cc. of hydrochloric acid and again boil the mixture for five minutes; no pink nor red color should develop (absence of Indian Gum). Powder: Whitish; forming with water a translucent mucilage and exhibiting numerous starch grains from 0.003 to 0.025 mm. in diameter, varying from spherical to elliptical, with occasional 2- to 4-compound grains, many of the grains being swollen and more or less altered, due to the drying of the *Tragacanth* before powdering. Powdered Indian Gum shows numerous fragments of lignified vegetable tissue. Ash not exceeding 3.5 percent.

Triticum.—Usually cut in pieces from 4 to 12 mm. in length and from 1 to 2.5 mm. in diameter; externally light yellow or yellowish-brown, longitudinally furrowed, smooth, shiny, nodes with circular leaf-scars, a few root-scars and occasional slender roots; fracture tough, fibrous; internally lemon-yellow and with a large, hollow pith; odor slight, aromatic; taste sweetish. Roots filiform, irregularly branching, attaining a length of 5 cm. and not more than 0.5 mm. in thickness, light brown or yellowish brown, frequently covered with long root-hairs. Under the microscope, transverse sections show a single layer of strongly lignified epidermal cells; a hypodermis of 3 to 6 rows of more or less polygonal cells with strongly lignified walls; a cortex of 10 to 16 rows of thin-walled parenchyma cells, occasionally with nearly spherical starch grains about 0.005 mm. in diameter, or with irregular masses of a more or less soluble carbohydrate; among the parenchyma cells and near the hypodermis occur small, widely separated fibro-vascular bundles each with a closed sheath of sclerenchymatous fibers;

an endodermis, the lateral and inner walls of the cells being moderately thickened, strongly lignified and somewhat porous; several layers of sclerenchymatous fibers immediately inside the endodermal ring, in which are embedded an interrupted circle of collateral fibro-vascular bundles having large tracheæ; adjoining these are usually 8 to 10 rows of parenchyma cells with a few fibro-vascular bundles and a pith in which the parenchyma cells are more or less broken or absent. Powder: Light yellowish; consisting of irregular, lignified fragments, numerous fragments showing tracheæ with annular or spiral thickenings or marked with simple pores and associated with long, narrow, rather thin-walled, strongly lignified, sclerenchymatous fibers; fragments of epidermis made up of cells rectangular in outline, the longer walls considerably thickened, strongly lignified and marked with numerous transverse pores; ends of epidermal cells usually separated from each other by a very narrow cell with thin walls and few pores; numerous fragments of parenchyma rectangular in outline and with thin, porous walls. Ash not exceeding 3 percent.

Ulmus.—Usually in bundles consisting of flat, oblong pieces 30 cm. in length, from 10 to 15 cm. in width; outer surface of a light brown or buff color with occasional dark brown patches of adhering cork, longitudinally striate and with detached bundles of bast-fibers, and colored blackish upon the addition of a very diluted iodine T. S.; inner surface light yellowish-brown nearly smooth and finely striate, only slightly darkened upon the addition of a very diluted iodine T. S.; fracture fibrous with projecting bast-fibers, the broken surface porous, due to the large mucilage cells; odor distinct; taste mucilaginous. Powder: Very light brown; consisting mostly of fibrous fragments, and a finely granular portion made up of small starch grains, the latter being immediately colored bluish-black upon the addition of iodine T. S.; starch grains mostly spherical or more or less polygonal, usually about 0.003 mm. in diameter, but also attaining a diameter of 0.025 mm.; bast-fibers very long, about 0.020 mm. in diameter, with rather thin, slightly lignified walls; calcium oxalate in monoclinic prisms, mostly in crystal-fibers, the individual crystals from 0.010 to 0.025 mm. in diameter; fragments of large mucilage cells with adhering starch grains. Macerate 1 part of powdered *Ulmus* with 40 Cc. of distilled water for an hour and filter; the filtrate should be of a rather thick, mucilaginous consistence.

Uva Ursi.—The drug may include not more than 5 percent, of stems and other foreign matter. Usually more or less entire, laminae obovate or oblong, spatulate, from 12 to 30 mm. in length, 5 to 13 mm. in breadth; summits obtuse or rounded; margins entire, slightly revolute; bases cuneate, tapering into short, stout petioles; upper surfaces dark green, glabrous and shiny, finely reticulate; under surfaces yellowish-green and slightly pubescent, especially on the midribs; coriaceous; fracture short; odor aromatic, tea-like; taste astringent and somewhat bitter. Powder: Olive green; consisting of irregular fragments; epidermal cells polygonal, those of the lower surface showing broadly elliptical stomata about 0.035 mm. in length, surrounded by 5 to 8 neighboring cells; cells of mesophyll with chloroplastids and frequently irregular masses of a carbohydrate; fragments of fibro-vascular bundles with spiral tracheæ associated with narrow, strongly lignified sclerenchymatous fibers and frequently also with crystal-fibers

showing monoclinic prisms, from 0.006 to 0.015 mm. in diameter; numerous fragments made up of cells having a yellowish-brown content which are colored a bluish-black upon the addition of ferric chloride T. S. Add 0.100 Gm. of powdered Uva Ursi to a watch crystal, cover with another watch crystal and gently heat the powder; a crystalline sublimate should be formed consisting of long rods and feather-like aggregates which polarize light with a brilliant play of colors. Macerate 1 Gm. of powdered Uva Ursi with 10 Cc. of boiling water, shake the mixture occasionally until cold and then filter it; the filtrate should yield a grayish-purple precipitate upon the addition of a few drops of ferrous sulphate T. S.

Valeriana.—Rhizome upright, from 2 to 4 cm. in length, and from 1 to 2 cm. in diameter, usually cut longitudinally into 2 to 4 pieces; externally yellowish-brown or dark-brown, upper portion with stem-bases and frequently with a short horizontal branch or stolon, and from the outer surface arise numerous, slender, brittle roots; fracture of rhizome short and horny, internally light brown, with a thick bark and narrow central cylinder; odor pronounced, of valeric acid, becoming stronger upon aging; taste sweetish, camphoraceous and somewhat bitter. Under the microscope transverse sections of the root show a single epidermal layer of papillose cells, some being modified to root hairs; a hypodermal layer containing some secretion cells with suberized walls and in which are usually numerous small, oily globules and occasionally small prismatic crystals; cortical parenchyma, the cells filled with starch, some of the cells near the hypodermis containing a few oil globules; an endodermis of thin-walled cells surrounding a pericambium; a central cylinder with usually 3 to 5 fibro-vascular bundles; tracheæ with simple and bordered pores. Older roots show a large pith of starch-bearing parenchyma, a secondary thickening in the fibro-vascular bundles and a periderm of a few layers of cells. Sections of the rhizome show a thin periderm, a cortical parenchyma with scattered fibro-vascular bundles, a layer of altered cells of the endodermis, numerous, more or less twisted, collateral, fibro-vascular bundles and a large pith. Powder: Light brown to grayish-brown; starch grains numerous, from 0.003 to 0.020 mm. in diameter, spherical, plano-convex, polygonal, 2- to 4-compound and each usually with a central cleft; tracheal fragments, the walls having simple and bordered pores or scalariform and reticulate thickenings, accompanied by narrow sclerenchymatous fibers, the walls being thin, porous, and strongly lignified; occasional fragments of epidermis with root hairs, and fragments of cork. Ash not exceeding 20 percent.

Vanilla.—Yielding not less than — percent of vanillin. Pods linear, flattened, from 15 to 35 cm. in length and from 5 to 9 mm. in breadth; summits terminating in flat circular scars; gradually tapering, more or less bent and curved or hooked at the bases, or in the Tahiti variety, broad in the middle and tapering towards either end, the base closely resembling the summit; externally blackish-brown, longitudinally wrinkled, moist-glossy, and occasionally with an efflorescence of vanillin in the form of acicular crystals or monoclinic prisms; frequently with narrow, elliptical or irregular, more or less wrinkled, dark-brown patches of cork; occasionally split into three parts near the tip; flexible and tough, 1-locular, containing a blackish-brown pulp and numerous blackish-brown seeds; the latter being flattened, irregularly triangulate or nearly

circular in outline, reticulate and varying from 0.250 to 0.300 mm. in diameter; odor and taste characteristic and very agreeable. Under the microscope transverse sections of the pods show an epidermis with a somewhat thickened outer cuticularized layer having occasionally rounded or conical masses of the excretion of a gum-like substance; a layer of collenchyma of 1 or 2 rows of cells; a thick sarcocarp composed of parenchyma cells in which are embedded an interrupted circle of fibro-vascular bundles; the parenchyma cells are deeply undulate in outline, and usually contain a thin protoplasmic layer enclosing numerous oily globules or may possess bundles of raphides of calcium oxalate, the individual crystals varying from 0.200 to 0.400 mm. in length; some of the parenchyma cells are specially modified and distinguished by their somewhat thickened walls with long, oblique, slit-like pores or the thickening may extend in the form of broad, spiral bands; in the fibro-vascular bundles the phloem is central, being more or less surrounded by a few tracheæ, the walls possessing slit-like pores or spiral thickenings, and at the outside of the bundle is a closed circle of sclerenchymatous fibers, the walls being rather thin, strongly lignified, provided with numerous, transverse, simple pores, the outer wall of the outer row of fibers being irregular or sinuate; from the inner walls of the endocarp arise the placenta bearing numerous brownish-red or blackish seeds, otherwise from the cells of the endocarp arise numerous long, nearly straight hairs, the ends being rounded, the hairs being more or less matted together by a gummy or resinous mass in which some of the seeds are held; in mounts made in hydrated chloral T. S. or potassium hydroxide T. S., the immature, brownish-red seeds show a deeply reticulate seed-coat, the cells being of an oblong-polygonal form in surface view. Place a few of the crystals, occurring as an efflorescence on the fruit, on a microscopic slide or watch crystal and add a drop of phloroglucinol T. S. and hydrochloric acid; the solution should immediately acquire a carmine-red color (distinction from benzoic acid). Diluted alcohol extractive, not less than 12 percent. Ash not exceeding 6 percent.

Veratrum Viride.—The dried rhizome and roots of *Veratrum viride* Aiton, (Fam. Lilacæ), known in commerce as American Hellebore, with not more than 5 percent. of stems and other foreign matter. Rhizome upright, obconical, usually cut longitudinally into 2 to 4 pieces, from 2 to 7 cm. in length, from 1.5 to 3 cm. in diameter, externally light brown to dark brown or brownish-black, frequently bearing at the summit numerous, closely arranged, thin leaf-bases, otherwise rough and wrinkled; somewhat annulate from scars of bud-scales and bearing in the outer portion numerous roots, the lower part more or less decayed; fracture hard and horny; internally yellowish or grayish-white, marked with numerous, irregular fibro-vascular bundles; inodorous but sternutatory; taste bitter and acrid. Roots: Nearly cylindrical, from 3 to 8 cm. in length, 1 to 3 mm. in diameter, externally light brown to yellowish-brown, deeply transversely wrinkled; fracture short, bark whitish, very thick, enclosing a porous central cylinder. Powder: Grayish-brown to dark brown, strongly sternutatory; starch grains numerous, from 0.003 to 0.020 mm. in diameter, spherical or ellipsoidal, single or 2- to 3-compound, the individual grains being often swollen or otherwise more or less altered; calcium oxalate in raphides, from 0.015 to 0.150 mm. in length; fragments with tracheæ, the walls being more or

less strongly lignified and marked with scalariform or reticulate thickenings, frequently containing a lemon-yellow substance and associated with narrow, slightly lignified, porous, sclerenchymatous fibers; reddish-brown or brownish-black cork fragments occasional.

Viburnum Opulus.—The dried bark of *Viburnum Opulus* Linné (Fam. Caprifoliaceæ), with not more than 5 percent. of wood and other foreign matter. In strips, or occasionally in quills or chip-like fragments, the bark attaining a thickness of 3 mm.; outer surface of the thinner pieces of a light gray color with crooked, longitudinal, purplish-brown stripes and very small brown lentils, the thicker pieces purplish-red or occasionally blackish, except when very young, and more or less finely fissured or thinly scaly; inner surface varying in color from yellowish to rusty-brown, with very short oblique striæ, except where the outer wood layer adheres; fracture short and weak, the fractured surface mostly whitish, varying to pale brown in the inner layer, rusty-brown in the outer layer covering green, tangential, phelloderm plates; odor strong and characteristic; taste mildly astringent and decidedly bitter. Under the microscope sections show an outer corky layer, of 5 to 25 rows of cells, the walls nearly colorless, frequently thickened on the inner surface, individual cork cells from 0.015 to 0.045 mm. in radial diameter and from 0.030 to 0.075 mm. in tangential diameter; outer bark of about 10 rows of cells containing a brownish-yellow, amorphous substance, small starch grains or chloroplastids, medullary rays 1 to 2 cells in width, usually not more than 1 cell wide, inner bark with occasional groups of bast-fibers composed of 1 to 10 cells, the walls being very thick, non-lignified, lamellated and finely porous; adhering wood with large tracheæ having scalariform or reticulate thickenings, and being surrounded by wood-fibers with thick lignified walls; starch grains, mostly in cells of parenchyma and medullary rays, either single or compound, the individual grains not exceeding 0.006 mm. in diameter; calcium oxalate in rosette aggregates, from 0.015 to 0.040 mm. in diameter; numerous fragments of parenchyma cells, the lumina filled with a reddish-brown amorphous substance. The bark of *Acer spicatum* Lamarck (Fam. Aceraceæ), is distinguished by the smaller cork cells with very thick walls, the individual cells from 0.006 to 0.008 mm. in radial diameter and about 0.020 mm. in tangential diameter, medullary rays from 1 to 3 cells in width, mostly 2 to 3 cells wide; bast-fibers numerous, in tangential groups, calcium oxalate in monoclinic prisms, chiefly in the outer cortex, the individual crystals being from 0.010 to 0.040 mm. in length, smaller crystals being associated with the bast-fibers in the inner bark. Powder: Light grayish-brown, consisting of irregular fragments; cork cells polygonal, with thin, colorless walls; parenchyma with rosette aggregates of calcium oxalate, from 0.010 to 0.040 mm. in diameter; starch grains very small and mostly in parenchyma cells; fragments of parenchyma containing a brownish-yellow amorphous substance; occasional tracheal fragments associated with lignified wood-fibers. The powder of the bark of *Acer spicatum* shows numerous prismatic crystals of calcium oxalate, from 0.010 to 0.040 mm. in length, and groups of bast-fibers with adjoining crystal-fibers.

Viburnum Prunifolium.—The bark may include not more than 5 percent. of wood and other foreign matter. In irregular, transversely curved or quilled

pieces, from 1.5 to 6 cm. in length, from 0.5 to 1.5 mm. in thickness; outer surface grayish-brown, or where the outer cork has scaled off, brownish-red, longitudinally wrinkled; inner surface reddish-brown, longitudinally striated; fracture short but uneven, showing in bark which is young or of medium thickness a dark brown cork, a brownish-red outer cortex, and a whitish inner cortex in which are numerous light yellow groups of sclerenchymatous tissues; odor slight; taste distinctly bitter and somewhat astringent. Powder: Dark brown; stone cells numerous, large, often elongated, thick-walled and strongly lignified; bast-fibers few; crystals of calcium oxalate from 0.015 to 0.035 mm. in diameter, occurring mostly in rosette aggregates, occasionally in crystal-fibers; monoclinic prisms of calcium oxalate few.

Zanthoxylum.—The dried bark of *Zanthoxylum americanum* Miller, known in commerce as Northern Prickly Ash Bark, of *Zanthoxylum Clava-Herculis* Linné, known in commerce as Southern Prickly Ash Bark (Fam. Rutaceæ). Northern Prickly Ash Bark: In transversely curved fragments or quills, from 2 to 15 cm. in length; bark from 0.5 to 2 mm. in thickness; outer surface light gray to brownish-gray with grayish patches of foliaceous lichens bearing numerous small black apothecia; longitudinally wrinkled and with numerous whitish lenticels, the cork occasionally abraded showing the yellowish or orange colored inner bark; inner surface yellowish-white, finely longitudinally striate and usually with numerous, bright, shining crystals; fracture short, uneven; odor slight, taste bitter, acrid, becoming pungent. Under the microscope transverse sections of Northern Prickly Ash Bark show an outer corky layer consisting of 4 to 20 rows of cells, the tangential walls being strongly thickened and lignified, a layer of collenchyma composed of 8 to 10 rows of tangentially elongated cells, with very thick walls and containing plastids; a more or less indistinct row of endodermal cells beneath which is an interrupted circle of small groups of primary bast-fibers; the inner bark consists of numerous parenchyma cells among which are included large oil secretion reservoirs, separated by medullary rays which are mostly one-cell in width; the parenchyma cells as well as the oil secretion reservoirs contain numerous colorless oily globules. Scrapings from the inner surface show numerous rod-shaped crystals and flat prisms from 0.015 to 0.250 mm. in length, which polarize light with a display of bright colors. Southern Prickly Ash Bark: In transversely curved or irregular, oblong flattened pieces, or in quills, from 2 to 40 cm. in length, bark from 1 to 4 mm. in thickness; outer surface light gray to brownish-gray marked by numerous large barnacle-shaped projections of cork from 0.5 to 3.5 cm. in thickness, otherwise with numerous grayish patches of foliaceous lichens, bearing numerous blackish apothecia, and numerous, elliptical lenticels; inner surface light yellowish-brown to olive brown, obscurely longitudinally striate and free from crystals, odor and taste as in Northern Prickly Ash Bark. Under the microscope transverse sections of Southern Prickly Ash show a strong development of lignified cork occurring in the form of rings, the successive layers being separated by several rows of narrow tabular cells strongly thickened on the tangential walls; a thin layer of collenchyma followed by the other tissues of the primary cortex and consisting of small groups of rather large stone cells and occasional, scattered groups of bast-fibers and parenchyma; the inner bark consists of parenchyma,

a more or less indistinct leptome or sieve tissue and among which are numerous large, light yellowish oil secretion reservoirs, medullary rays from 1 to 2 cells in width; and occasional groups of stone cells and bast-fibers; starch grains numerous, nearly spherical, from 0.002 to 0.010 mm. in diameter, and occurring in the parenchyma cells and medullary rays; calcium oxalate chiefly in monoclinic prisms from 0.010 to 0.025 mm. in diameter, occurring in crystal-fibers and in parenchyma cells of the primary cortex. Powder of *Zanthoxylum*: Light grayish-brown, consisting mostly of irregular fragments; cork cells nearly colorless and strongly lignified fragments of parenchyma containing either small starch grains, oily globules or monoclinic prisms of calcium oxalate; stone cells in small groups with thick, colorless walls contain frequently a reddish-brown content, bast-fibers few and non-lignified. In the Northern Prickly Ash, the stone cells and calcium oxalate crystals are usually absent and the fragments of cork relatively less numerous.

Zingiber.—The outer cortical layer may be either partially or completely removed. Jamaica Ginger: Rhizomes free from the outer corky layers, in horizontal, laterally compressed, irregularly branched pieces, 4 to 16 cm. in length, and from 4 to 20 mm. in thickness; externally light brown, longitudinally striate, ends of the branches with depressed stem scars; fracture short-fibrous, mealy and resinous; internally yellowish to light brown, cortex thin, endodermis, a thin yellow layer enclosing a large central cylinder with numerous groups of fibro-vascular bundles and yellowish oil cells; odor agreeably aromatic; taste aromatic and pungent. African Ginger: Rhizomes with cork partly removed on the flattened sides, the patches without cork smooth and of a light brown color. the portions with cork longitudinally or reticulately wrinkled and grayish-brown; fracture short or short-fibrous; internally lemon-yellow or dark bluish with yellowish oil secretion cells and light yellow to reddish-brown resin cells; odor strongly aromatic, taste intensely pungent. Calcutta Ginger: Rhizomes resembling the African Ginger, the branches or "fingers" being somewhat larger, and with a considerable proportion of shriveled pieces; externally grayish-brown or grayish-blue; fracture short and mealy, or horny; internally light yellow or light brownish-yellow with numerous yellowish oil cells and yellowish-brown resin cells; odor aromatic; taste starchy and strongly pungent. Calicut Ginger: Rhizomes resembling African Ginger, more of the periderm being usually removed; externally more or less uniformly light brown; fracture short or short-fibrous and mealy; internally light or brownish-yellow with numerous yellowish oil and resin cells; odor aromatic; taste very pungent. Cochin Ginger: Rhizomes with most of the corky layer removed on the flattened sides; externally light brown to grayish-yellow; fracture short and mealy; internally yellowish-white with numerous yellowish oil cells and brownish-red or blackish resin cells; odor aromatic; taste pungent but not so persistent as in the African variety. Japanese Ginger: Rhizome somewhat resembling Cochin Ginger but usually with a thin coating of lime; externally nearly smooth or slightly wrinkled and of a whitish color; fracture short and very mealy; internally varying from a yellowish-white to light brown and with numerous brownish-red resin cells; odor aromatic; taste pungent. Powder: Light yellow, or light brown to dark brown; starch grains numerous and varying greatly in the different varieties, in form

and size being nearly spherical, ovoid, ellipsoidal or pear-shaped and frequently with a characteristic beak, usually from 0.005 to 0.040 mm., occasionally from 0.045 to 0.060 mm., in long diameter; sclerenchymatous fibers long, thin-walled, non-lignified, with oblique pores, and distinctly undulate on one side; oil secretion cells with suberized walls and containing a light yellowish or yellowish-brown, oily substance; cork cells absent in the Jamaica variety. Non-volatile ether extract not less than 2 percent. Alcoholic extract not less than 4 percent. Ash not exceeding 8 percent.

SOME REFORM MEASURES FOR THE A. PH. A.

The Association Has Grown So Fast That Reorganization is an Imperative Necessity—
Particularly is This True of the Annual Conventions, Which are in
Need of More System and Method.

HARRY B. MASON, DETROIT.

The time has come for the American Pharmaceutical Association to undergo a more or less radical reorganization. This statement does not imply that the A. Ph. A. has lost its vitality and is in need of fresh energy. Not at all. On the contrary, indeed, the trouble arises from too much energy instead of too little, and what is needed is that this energy, in its manifold manifestations, shall be harnessed up and co-ordinated in a more intelligent manner. This is particularly true of the annual meetings.

The fact of it is, the A. Ph. A. has undergone a great development during the last ten years. It has spread out in many directions. It is like a growing boy whose original suit of clothes has been lengthened in the legs, extended in the arms, widened in the seat, and enlarged here and there until the result is somewhat grotesque. What is required is a new suit of clothes, cut to fit the A. Ph. A. in its present proportions.

The Confusion at Nashville. The situation at Nashville last August was one of confusion worse confounded. There were the seven regular sections of the Association, each holding two or three sessions. There was the annual meeting of the National Association of Boards of Pharmacy with four or five sessions. There was the annual meeting of the Conference of Pharmaceutical Faculties. There was the joint conference of the latter two bodies and the section on education and legislation of the A. Ph. A. The Revision Committee of the U. S. P. seized upon the occasion to hold two or three meetings. The Revision Committee of the N. F. did precisely the same thing. The Pharmaceutical Syllabus Committee met every night from 9:30 until 12 or 1 in an effort to complete the second edition of the book. The new House of Delegates of the A. Ph. A., organized the year before, held three sessions, and its Committee on Resolutions one or two in addition. The new Section on Pharmacopœias and Formularies held two

sessions, and the new Women's Section three. The Council met every morning at 9, and the groups of alumni of the various pharmacy schools and colleges grasped the opportunity to have meetings, luncheons and dinners in behalf of their alma maters. Besides all of which there were meetings galore of an indefinite number of committees of one kind and another.

As if all this were not enough, a proposition was advanced to create still another section of the A. Ph. A.—a section on materia medica and pharmacognosy. With it all there was no let-up in the work from 9 o'clock in the morning until 1 or 2 o'clock the next morning. Everybody was tired out. Everybody was more or less befuddled by the multiplicity of business.

The Need for a Pruning Knife. Now what ought to be done?

There are several things to do by way of simplifying and improving the annual conventions, and what I shall have to say will touch upon this phase of the subject alone. The first thing is to get a sharp pruning knife and cut out a lot of things from the meetings that do not belong there. Some of these things can well be dispensed with entirely. Others may be taken care of by the *Journal of the A. Ph. A.* and by the Council.

First, as to those things which we can eliminate. What has often been referred to in chaste and elegant language as the "hot air" of the opening session should be tabooed. The day has passed when conventions were such novelties that they had to be called to the attention of state and city officials, and when the members of associations delighted to have welcoming speeches from these notables. Oratory is all well enough, but it bores people to death who go to a convention to transact business and to get something accomplished. Cut it out! Also cut out, or greatly condense, the formal installation of officers at the last session.

Then the standing committees of the A. Ph. A. need some culling. The Committee on the Revision of the Pharmacopœia is useless. The Committee on the Drug Market is obsolete. The Report on the Progress of Pharmacy is a feature of great value and importance, but it ought not to be considered at the annual meeting at all. Print it in a separate volume, or in the *Journal of the A. Ph. A.*, and let it go at that. What can be said about it at the meeting itself is so incomplete that it is of very little value anyway.

There are several committees which are appointed by the Council and which make their reports in the *Journal*. They ought not to take up the time of the Association at the annual convention. If any other report is needed than the one printed in the official organ, let it be rendered to the Council itself. The time of the annual meeting is valuable and precious. It should be husbanded. It should be devoted to business that cannot be attended to by the Council or in the official publication.

Still more in the way of elimination may possibly be done. Some members of the Association think we have gone too far in the creation of separate sections. They would have us return to the days of two or three sections. I do not agree with them. I do think, however, that the proposed Section on Materia Medica and Pharmacognosy should not be established. I think further that the Section on Pharmacopœias and Formularies, created three or four years ago, should be abandoned. Its work can be taken care of elsewhere.

All the other sections, unless it be the one given up to history, should be retained. They are devoted, respectively, to commercial papers, scientific interests, education and legislation, and practical pharmacy and dispensing.

These are all needed. To go any further in the direction of specialization, however, would be folly. The Association isn't big enough, even if there are enough subjects. If we have too many sections, there won't be audiences enough to go around.

Still continuing the subject of elimination, so far as the annual gatherings are concerned, it is at least an open question whether the meetings of the two auxiliary bodies, the National Association of Boards of Pharmacy and the Conference of Pharmaceutical Faculties, should not be held either late the week before, or early the week following, the convention of the A. Ph. A. These bodies add somewhat to the confusion of A. Ph. A. week, and to a certain extent take away from the attendance upon the various sections.

A Rational Program. So much, then, on the subject of elimination. Now for what is left. After all possible eliminations have been made, there inevitably remains a great mass and variety of work. There is no objection to this, *but there is a vital need of classifying and co-ordinating the work intelligently.* It is perfect folly to have a hit-and-miss program that nobody knows anything about, and that keeps people on the jump pretty nearly twenty-four hours every day for six working days.

The first thing to do is to keep the evenings free for rest, recreation, and social intercourse. Condense the work into the morning and afternoon periods. Start the section meetings in the morning at 9 o'clock, or not later than 9:30. In order to do this it will be necessary to have *the Council meet in the evening.* This august body, by prolonging its meetings so far toward noon every morning, delays and postpones the regular work of the sections, and nothing seems to me more important than that this evil should be eliminated. By starting the sections at 9 or 9:30 in the morning, a lot of good work can be done during the hours when people are fresh, unwearied and interested. This would make powerfully for added zest and profit.

But if you permit no section work in the evening, and if you restrict it to the morning and afternoon periods, you practically limit the number of work periods to eight. With five or six sections, each holding two or three sessions, making a total of twelve or fifteen sessions altogether, the present scheme of concurrent meetings will of course have to be retained. To this there is no possible objection. Indeed, the concurrent session idea can perhaps be developed more in the future than it has been in the past. Perhaps it can be extended so far as to condense the period of the annual meeting from six days into three or four, as is done by the American Medical Association. Many people are in favor of such a change.

Co-ordinating the Sections. What is needed, though, is a far better and more perfect co-ordination among the sections. As a man sits in one room, listening to the business of one section, he should know precisely what is going on across the hall or upstairs in other rooms at the same time. This will enable him to hear all that he wants to hear. It will likewise prevent him from being bored

to death in one section when something is going on in another that would hit his particular taste.

There are two ways of accomplishing this co-ordination. In the first place we have never worked out a printed program of the right sort. It ought to be possible to print one united program containing the detailed programs of all the different sections. It ought also to be possible to assign a paper arbitrarily to a definite session, and to its proper place in the program of that session, so that members can know approximately when certain subjects are coming up for attention. To supplement this, however, there should be established a system of blackboards, with two or three hotel "pages," so that the members in any one room would be notified what is simultaneously going on in the other rooms, and kept in touch perfectly with the multifarious work of the association. I am glad that Leonard A. Seltzer, local secretary this year, is going to systematize this blackboard scheme and see what can be done with it at the Detroit meeting in August.

Leave Time for Discussions! With the section work co-ordinated in this way, and with the members kept in touch with what is going on everywhere, it would easily be possible to give each section more sessions and thus provide time for the proper discussion of papers—a thing which has not been practicable now for many years. The discussions are often more important than the papers themselves. If a man only goes to a meeting to hear papers read, he might as well stay home and read them in the drug journals, with pipe and slippers, and with his feet on the mantel.

To recapitulate: If we eliminate from the annual convention what can easily be dispensed with, as suggested in the first portion of this paper, and if we work out a better co-ordination of the work of the different sections, we shall make an enormous improvement in the annual meetings. We shall get rid of what is unessential; we shall enable a member to hear everything that he really wants to hear; and we shall provide time for debate and interchange of opinion.

A Censor Required. At least one other thing is necessary. There should be some censorship exercised over the papers accepted for the different sections. One great objection to increasing the multiplicity of sections is that the different chairmen promptly begin a competition with one another to secure as many papers as possible. It becomes a matter of pride to see how long a list can be secured. The inevitable result is that a large majority of the material is poor and ought never to be prepared at all. Another result is that papers frequently get into the wrong section.

There ought to be some individual or some committee with authority over the different sections. Who can better serve in this capacity than the general secretary? He is really the general manager of the association, and he knows more about its activities than anybody else. I believe that the chairmen of the different sections should report to the general secretary; that he should have the authority of a censor; that he should eliminate papers if he thinks best; that he should re-assign papers if he deems such action necessary; and that he should get up, or have someone else to do so under his supervision, a co-ordinated program of the meeting. He should be general manager of the association in

name and in effect, and he should have all the functions of a general manager of a private corporation.

A Great Past—A Greater Future. Now I do not want to be misunderstood in making these criticisms. I do not want any reader to get the notion that I think the A. Ph. A. is all wrong. On the contrary, the A. Ph. A. is the one great catholic organization in American pharmacy—the one organization acting like a parent to all the others—representing every phase and branch of the calling, and doing foundational work of an indispensable character. It is an association with a great past. It is an association with a still greater future. My only point is that it has outgrown the clothes of a growing youth and now needs the equipment of the adult it has come to be. Particularly are the annual meetings in need of reform if they are successfully, intelligently, and efficiently to handle the vast amount of work undertaken by the association.—*The Bulletin of Pharmacy.*

SYRUP OF FERROUS IODIDE.

W. C. ALPERS, SC. D., CLEVELAND.

There are few preparations in the Pharmacopœia that have given more annoyance and caused more difficulties to the pharmacist than the syrup of iodide of iron. The literature on this syrup, from the first day of its appearance, is very voluminous and hundreds of writers on pharmaceutical subjects in all civilized countries have recommended various methods for its preparation and given direction for its preservation. The history of this syrup, as shown in the various editions of our own Pharmacopœia, demonstrates the gradual development of its understanding.

A liquid preparation of ferrous iodide appears first in the second edition of the U. S. P. (1840) under the name of *Liquor Ferri Iodidi*. It was made of iron wire and iodine and contained 5 fluidounces of honey in a finished product of 20 fluidounces. In the following edition, the third (1850), the honey was replaced by 12 ounces of sugar, but the preparation was still called a solution. The name syrup appears for the first time in the fourth edition (1860). The formula directs the addition of two troy ounces of iodine to a mixture of 300 grains of iron wire and water, and filtration of the resulting green liquid into simple syrup heated to 212° F. The syrup is to be preserved in well-stoppered two-ounce bottles. Here we see that the value of applying heat is recognized. No change in the formula was made in the fifth edition (1870). In the sixth revision (1880), of the Pharmacopœia, which shows throughout many marked improvements over the preceding ones, weights were replaced by parts and the finished product brought to 1000 parts, which designation afterwards gave way to cubic centimeters. Syrup of ferrous iodide is here described as a syrupy liquid containing 10 percent of ferrous iodide. It is made from 25 parts of iron and 82 parts of iodine. The liquor is filtered into 600 parts of sugar and the

syrup heated to the boiling point, before putting it into small, completely filled and well-stoppered bottles. It is to be kept exposed to daylight. In the seventh revision the iodine is increased to 83 parts and the liquor filtered through a funnel, the lower end of which dips below the surface of the sugar in order to prevent contact with the air. The instructions as to daylight were omitted. Here, too, we find for the first time directions for testing the syrup. In the eighth edition more changes were made. The percentage of ferrous iodide was reduced from ten to five, and two percent of hypophosphorous acid added as a preservative. Fifty grams of sugar are at once added to the aqueous boiling solution of ferrous iodide, before filtering it into the remainder of the sugar, which is to be dissolved by heat. No directions are given as to keeping the finished product.

The history of this syrup in the United States Pharmacopœia, as well as that of all other pharmacopœias, reveals the difficulties that are encountered in its preparation and the various methods employed to overcome them.

No matter how carefully the original ingredients—iron, iodine, water—are selected and tested as to their purity, the reaction between them will not always proceed alike. The pharmacopœias of all nations take notice of this peculiarity. They direct the addition of cold water to check the reaction, and gentle heating to promote the reaction, if necessary. It has never been explained why this different behavior in so simple a preparation should exist. In similar chemical processes a remedy for too violent reaction is sometimes found in the use of a catalyzer and some experiments made in this direction with the solution of ferrous iodide seem to indicate that it could be used here to advantage. I have tried a coil of clear, bright iron wire put in a porcelain dish with the chemicals to be of great service, the reaction proceeding gently and steadily so that neither heat nor cold water were needed. Dr. P. Bohrisch, of Dresden, in a recent article on this subject, recommends the use of a bright iron spatula to be held in the solution during the reaction.

That the stability of the syrup is increased by heating, was soon recognized. Hager, in his handbook, recommended it long before the pharmacopœias adopted it. Hager's idea was that the heat would invert some of the sugar, and that invert sugar was more stable than ordinary sugar. Following this suggestion O. Linde recommended the use of invert sugar, and Scheling claimed that glucose was still better. This last claim was explained by others as owing to the small amount of sulphurous acid always present in glucose. This again led to the addition of sulphurous acid in the form of sodium bisulphite. A number of other preservatives were also tried. Constatin-Tamasici, a noted French pharmacist, recommended the addition of six drops of lactic acid to one litre, while others preferred tartaric acid. Hausmann recommended hypophosphorous acid, a suggestion that had been made before by J. F. Judge in the American Journal of Pharmacy in 1876. The addition of 5 percent of pure alcohol is also mentioned in French journals as a good means of preserving the syrup. The latest chemical to be recommended is citric acid. Extensive experiments were made with it and at present three pharmacopœias, the Swiss, the Austrian and the Belgian, direct citric acid to be added in quantities of 0.5 to 1 percent.

Besides the preservatives the mode of keeping the finished syrup was carefully examined. Here also the investigators arrived at different results. Some recommended dark bottles, others light ones; some kept their product in dark closets, others exposed it to direct sunlight, and again others to diffused light. The directions in successive editions of nearly every pharmacopœia sufficiently show the tendency of the respective time and the changes that took place in the minds of the revisors.

In all these efforts to find the proper preservative for the syrup of iodide of iron the object in view was the preservation of color and taste of the syrup when kept on the shelves of the shops. But this is not sufficient, as has often been pointed out. If a physician orders two ounces of the syrup to be taken three times a day in doses of ten drops, there are about 100 doses in the bottle and the medicine will last longer than a month, during which time the color will often change. Every dispenser has had the experience that a customer will return with a bottle containing this syrup and ask if the changed color is an indication of deterioration. Our efforts should therefore be directed to prepare a syrup of iodide of iron that will keep not only on the shelves of the shop, but also in the hands of the patient when the bottle is opened several times a day.

Recognizing the difficulties of preparing and preserving this syrup the manufacturers of pharmaceuticals have tried to relieve the pharmacists of this care (!) by preparing a concentrated solution of the iodide of iron, from which the syrup of ferrous iodide is made by admixture with simple syrup. The remedy would be a good one provided a solution can be made that will keep. Experience, however, shows that these solutions, after opening the containers a few times, are subject to the same discoloration as the syrup.

When I was entrusted with the chairmanship of the sub-committee on syrups and elixirs for the 9th revision of our Pharmacopœia I commenced a series of experiments with a number of syrups, among others the syrup of ferrous iodide. More than sixty samples of the latter were examined. Some were bought from reputable druggists, some from manufacturers, some were made from solutions, but the majority were prepared according to the formulæ of various pharmacopœias. Every method known was employed. Granulated sugar, lump sugar, invert sugar and glucose were tried; also filtering the solution cold and hot into sugar or syrup. Heating the solution and heating the finished product was resorted to. All the recommended preservatives were tried. Some bottles were opened 3 times a day for a month and 5 to 10 drops taken out. Tests were made for free iodine, at the beginning of the work, after 3 months and after 6 months. The amount of ferrous iodide present was determined by the silver nitrate method of the Pharmacopœia. All observations were carefully noted.

. The results of this long series of observations are as follows:

The presence of a catalyzer during the preparation of the solution is desirable. A coil of bright iron wire or a bright iron spatula may be used.

The solution should be brought to the boiling point and the sugar dissolved in it at once by the aid of heat.

It is immaterial whether the finished syrup is again boiled or not.

The finished syrup should be kept in small, well stoppered, completely filled bottles in ordinary daylight. The color of the glass is immaterial.

Neither invert sugar nor glucose are preferable to granulated sugar.

Syrup of iodide of iron made from the best ingredients does not need any preservative to remain perfect on the shelves of the shop. The samples with hypophosphorous acid kept equally well as those without it; but its addition is neither an advantage nor a necessity.

After dispensing, or when the bottles are opened several times a day, citric acid is the best preservative; but its power seems to be restricted to a limited time, after which discoloration takes place very rapidly.

When the pale green color of the syrup has changed to lemon yellow or light brown, the loss of ferrous iodide is very small, ranging from one-fourth to three-fourths of one percent of the required quantity.

On the strength of these results the conclusion may be drawn that syrup of iodide of iron, when prepared from pure chemicals, does not need any preservative. When dispensed in bottles that will be opened several times a day, the addition of one-half of one percent of citric acid is advisable, provided the prescribed quantity will be consumed within thirty days. A slight change of the color during the prescribed time of taking it is negligible.

ASH CONTENT OF CRUDE DRUGS.

E. L. MAINES, PHAR. D.

Ash standards of crude drugs have been given more consideration of late years than formerly and are now included in the United States Pharmacopœia and the more widely known foreign pharmacopœias. Ash limitations were first introduced in the second edition of the German Pharmacopœia, published in 1882 and in the United States Pharmacopœia of 1880.

On account of the difficulty in securing reliable data on these ash standards, an investigation was begun in our laboratory with the object of securing suitable standards and ascertaining the actual variation in ash content of the various drugs.

These determinations were made upon the commercial air dried drugs after having been reduced to a fine powder (No. 60 if possible) and the sample incinerated until the residue was free from carbon, employing such means as to insure perfect combustion. The sample was placed in a tared porcelain crucible and at first, heated gently in a Bunsen flame, the temperature being gradually increased, or a blast lamp employed, until the residue ash contained no unconsumed carbon.

The ash standards as set by the various pharmacopœias are not all that could be desired. Most striking variations may be seen in ash standards for the same drug in different pharmacopœias as was clearly shown in a paper by M. I. Wilbert (Jour. A. Ph. A., May, 1912) and in which he gives a table of ash limitations for the recently published pharmacopœias.

The importance of ash examinations in determining the quality of crude drugs should not be overlooked as they form one of the best tests as to quality, uniformity, etc.

The Report of the Committee on Drug Market for 1913 contains ash determinations for nearly all of the crude drugs reported.

The ash standards of the various pharmacopœias and other authorities, are given as a means of comparison with the results reported.

TABLE SHOWING ASH CONTENT OF CRUDE DRUGS.

<i>Drug.</i>	<i>Physical Condition.</i>	<i>Ash %.</i>	<i>Remarks.*</i>
Acacia No. 1.....	powdered	1.73 to 2.53	Ph. G., Ph. Hung., Ph. Svec., Ph. Belg., 5%; Ph. Ital., Ph. Helv., Ph. Ndl., U. S. P., 4% ash.
Acacia No. 2.....	powdered	2.19 to 2.82	
Acacia No. 2.....	granular	2.36	
Aconite Root (German).....		3.80 to 5.98	
Aconite Root.....	powdered	3.52	
Althea Root.....	powdered	8.18 to 10.35	K., 5%; Ph. Belg., 7½%; Ph. Aust., Ph. Helv., 6%; Ph. Ndl., 7%.
Aloes, Socotrine.....	powdered	4.63 to 8.95	K., 4%; Ph. G., Ph. Aust., 1%; Ph. Fr., Ph. Helv., Ph. Ndl., 1.5%; Ph. Ital., 2% ash.
Agaric, White.....	granular	1.29	
Angelica Seed (European)....	granular	7.16 to 7.35	
Asafoetida	powdered	8.73 to 16.79	U. S. P., Ph. G., 15%; Ph. Ital., Ph. Fr., Ph. Svec., Ph. Aust., Ph., Belg., Ph. Ndl., 10%; Ph. Helv., 20%.
Avena Sativa.....	granular	0.4	U. S. D., 2.15% ash.
Balm Gilead Suds.....	granular	1.84 to 2.41	
Belladonna Leaves.....	granular	6.25 to 13.30	Ph. G., Ph. Helv., Ph. Aust., 15% ash.
Berberis Aquifolium.....	ground	2.85 to 3.20	
Berberis Aquifolium.....	granular	2.64 to 2.78	
Berberis Aquifolium.....	powdered	2.07 to 2.54	
Black Haw, Bark of Root.....	granular	11.54 to 12.64	
Black Haw, Bark of Root.....	ground	12.38 to 13.41	
Black Haw, Bark of Root.....		12.81	K., 10% ash. Sample very dirty, containing much silicious matter.
Blood Root.....	granular	5.27 to 7.42	
Blood Root.....	ground	7.23	
Blue Cohosh.....	granular	6.78 to 7.84	
Blue Flag Root.....	granular	3.14	
Broom Corn Seed.....	whole sd.	2.58	
Buchu, Long.....		3.84 to 4.60	
Buchu, Short.....	ground	4.75	
Buchu, with Stems.....	granular	5.24	U. S. D., 4.40% to 4.69% ash.
Buckthorn Bark.....	granular	5.15 to 5.84	K., 5 to 6% ash.
Burdock Root (Foreign).....	granular	4.20 to 10.45	
Calamus Root.....	granular	2.75 to 3.81	
Cannabis (African).....	granular	18.80	
Cannabis Indica.....	powdered	14.00 to 20.89	
Cantharides, Russian.....	powdered	6.61	U. S. P., Ph. G., Ph. Helv., Ph. Aust., 8%; Ph. Ndl., 9%; Ph. Ital., 7% ash.
Capsicum	powdered	6.86 to 6.96	
Capsicum	granular	5.10 to 6.19	Ph. B., Ph. G., Ph. Helv., Ph. Aust., 6½%; Ph. Hung., 5% ash; K., 4 to 6% ash.
Caraway Seed (Dutch).....	granular	5.93 to 6.82	U. S. P., Ph. Helv., Ph. G., 8%; Ph. Aust., 7% ash.
Cardamom	granular	4.92 to 5.47	Ph. Aust., Ph. Ndl., 8%; Ph. Helv., 10% ash.
Cardamom	powdered	5.04 to 7.49	U. S. P., 4% ash.
Cascara Sagrada.....	powdered	4.70	K., ash 7%; Ph. G., 6%; Ph. Ndl., 10% ash.
Catnip Herb.....	granular	11.09	
Celery Seed.....	granular	7.25 to 10.22	
Chamomile Flowers (Hung.)..	granular	2.00 to 2.64	
Charcoal (Willow).....	powdered	6.21	Ph. G., 5%; Ph. Ital., Ph. Helv., Ph. Ndl., 2% ash.
Cinchona Bark, Red.....	granular	9.30 to 15.07	
Cinnamon, Saigon Quills.....	powdered	3.06 to 5.03	

<i>Drug.</i>	<i>Physical Condition.</i>	<i>Ash %.</i>	<i>Remarks.*</i>
Cinnamon, Saigon Quills.....	granular	3.12 to 4.53	
Cinnamon Bark (China).....	granular	1.83	
Cinnamon Bark (China).....	powdered	2.73	
Clover Tops, Red.....	granular	8.45 to 12.60	
Cloves	powdered	5.25 to 5.54	U. S. P., Ph. Aust., Ph. G., 8%; Ph. Helv., 7%; Ph. Ndl., 6% ash.
Coca Leaves (Truxillo).....	granular	6.22 to 12.07	
Cochineal	powdered	3.69 to 13.15	Labeled—For technical use only.
Cochineal, Silvered.....	whole bug	6.86	U. S. P., Ph. Helv., 6% ash.
Cochineal, Black.....	whole bug	7.01	
Colchicum Seed.....	granular	2.23 to 2.51	K., 2½% ash.
Colombo Root.....	granular	7.87 to 10.87	K., 6%; Ph. Helv., 8%; Ph. Aust., 6% ash.
Corn Silk, Dried.....	granular	5.38 to 7.61	K., 12% ash.
Cramp Bark.....	granular	1.45 to 3.50	Cramp Bark so-called.
Cubeb, Berries (Stemless).....	powdered	6.03 to 7.87	K., 6%; Ph. G., Ph. Helv., 8%; Ph. Ital., Ph. Aust., 9%; Ph. Ndl., 10% ash.
Cubeb Berries (with Stems)...		6.64 to 6.80	
Cubeb Berries.....	powdered	6.61	
Cudbear	powdered	7.83	Label stated—8 to 10% ash.
Damiana	granular	10.41	
Dandelion Root.....	granular	3.03 to 15.30	K., 5% ash.
Digitalis Leaves.....	granular	6.90 to 7.75	
Digitalis Leaves.....	powdered	11.55 to 11.90	K., 10 to 16%; Ph. Belg., Ph. Helv., Ph. Aust., 10% ash.
Doggrass, German.....	granular	4.65 to 5.48	
Doggrass	ground	3.94	
Dogwood, Jamaica.....	granular	9.99 to 11.47	Some samples were very dirty, containing many small pebbles.
Echinacea Root.....	granular	4.87 to 5.22	
Echinacea Root.....	powdered	5.86 to 6.05	
Ergot	granular	3.40 to 4.16	K., 4½%; Ph. Ital., Ph. Helv., Ph. Aust., Ph. Ndl., 5% ash.
Euphorbia	granular	8.33 to 21.66	One sample the ash consisted principally of sand.
Fennel Seed (Moravian	granular	7.85 to 8.40	K., 7%; Ph. Helv., Ph. G., Ph. Aust., 10%; Ph. Belg., 12% ash.
Gamboge	powdered	0.82 to 1.21	K., 1 to 3% ash.
Gelsemium Root.....	granular	2.24 to 2.59	
Gentian Root.....	granular	2.99 to 2.42	Ph. Aust., 5%; Ph. Helv., Ph. Ndl., 6%; Ph. Belg., 7% ash.
Gentian Root.....	powdered	4.07	
Ginger, Jamaica.....	powdered	2.81 to 4.24	N. S. D., 4 to 5% ash.
Ginger, Jamaica.....	granular	3.31 to 4.01	
Golden Seal Root.....	granular		Ph. Ital., Ph. Aust., Ph. Helv., Ph. Ndl., 6% ash.
Golden Seal Root.....	powdered	9.93 to 14.33	
Guarana	powdered	0.89 to 1.18	K., 2% ash.
Guaiac Gum.....	powdered	3.20 to 4.95	K., not more than 4% ash.
Henbane Leaves.....	granular	20.45 to *35.32	Ash principally sand. Ph. G., 24% ash.
Hydrangea Root.....	granular	2.91 to 5.18	
Ipecac, Carthagera.....		6.21 to 8.05	
Ipecac, Carthagera.....	powdered	5.44 to 7.83	Ph. Helv., Ph. Ital., 4%; Ph. Aust., 5%; Ph. Ndl., 6% ash.
Ipecac Root.....	powdered	3.28 to 5.06	
Irish Moss, Bleached.....	whole	16.61 to 17.64	U. S. D., not more than 17%; K., 10 to 15% ash.
Juniper Berries.....		3.82	K., 2 to 4% ash.
Juniper Berries.....	granular	3.17 to 3.19	
Larkspur Seed.....	powdered	5.00 to 6.42	
Licorice	cuttings	5.18 to 5.62	
Licorice, Spanish.....	cuttings	2.61 to 6.61	Ph. Helv., Ph. Aust., Ph. Ndl., 6%; Ph. Belg., 7% ash.
Life Root Plant.....	granular	8.26 to 9.61	
Liverwort Leaves.....	granular	10.25	

<i>Drug.</i>	<i>Physical Condition.</i>	<i>Ash %.</i>	<i>Remarks.*</i>
Lobelia Herb.....	granular	8.04	
Lycopodium		0.27 to 1.44	U. S. P., Ph. Ndl., 5%; Ph. Belg., Ph. Ital., 4%; Ph. Aust., Ph. Helv., Ph. G., 3% ash.
Manaca	granular	1.34 to 1.82	
Mandrake	granular	5.42

ANALYTICAL LABORATORIES, BRISTOL-MYERS COMPANY, January 30th, 1914.

PHYSICIANS AND CLEANLINESS.

"In an article in the *Southern Medical Journal*, an abstract of which appears in this issue, Dr. Charles Wardell Stiles severely criticises certain physicians with whom he has come in contact for a want of cleanliness in their offices, and for lack of careful observance of the rules of general hygiene. He says that inasmuch as physicians constantly advocate health legislation, they should be prepared to set a proper example of cleanliness for the laity. His contention is supported by numerous instances, which he cites, of the shortcomings of physicians in this respect in connection with their offices, their homes and their conduct in public meetings. Stiles' experience is no doubt unusual and his criticism is probably applicable only to the careless few. It is true, however, that physicians should set an example for the public in hygienic matters, and that they should be almost over-scrupulously clean for

the added reason of safety to their patients. This severe castigation of physicians is valuable therefore in calling again to the attention of physicians the importance of strict personal and practical cleanliness as an aid and example for the public.—*Jour. Am. Med. Assn.*

The abstract referred to above is as follows:

"Experience forces Stiles to the conclusion that there is not an inconsiderable number of physicians in practice who have exceedingly elementary ideas on the subject of cleanliness. He says that an entire book could be written on the condition of the privy one finds at the home of the average physician in small towns and in rural districts. In by far the majority of instances Stiles has seen, these guardians of the life of human beings have the common surface privy, open in the back, scattering soil pollution, breeding flies, and thus providing human excreta as a condiment to the food consumed by themselves, their families and their neighbors. The moral to the tale is, he continues, that resolutions adopted by these gentlemen as to the necessity for any given plan of public health legislation are somewhat lacking in weight of professional authority. Some of them seem to think that the only way to bring about a public health reform—much needed as it is—in this country is to put a physician in the president's cabinet. Without taking any stand as to the advisability of the existence of such a cabinet official, Stiles suggests that a full time county health officer who will, among other things, compel these gentlemen to clean up their offices, operating rooms, and privies, and force them to stop spitting on the floor, might contribute somewhat to a reduction of the death rate. Stiles cites some forceful personal observations."—*Jour. Am. Med. Assn.*

THE LOOK AHEAD.

It is the druggist who can see ahead who gets the bulk of the business. He gets it not merely because he can see ahead, but because he takes proper advantage of that foresight. The man who looks ahead is the man who sees what goods will be in demand two or three months from now and prepares his stock in advance. It takes no particular shrewdness to make a note from day to day of the articles that are called for and to order in accordance with the immediate demand. Anybody can run a store on the basis of present day demands. But not everybody can run a store successfully on that basis. It is the look into the future that enables a man to meet the coming demand when it first appears. It is not difficult to anticipate the demands of the coming spring by studying the market and referring to the details of the business done last spring. It is not because it is difficult that comparatively few druggists look ahead far enough and often enough. It is because they do not think of it or because they do not think it worth while. Nothing is better worth while in all the realm of store-keeping than looking ahead and studying the probable needs of tomorrow. It may almost be said that today will take care of itself with the present stock. The successful druggist must learn to live in the future a part of his time. One of the best glasses through which to see the business future is the trade paper.—*American Druggist.*

Papers Presented to Local Branches

PROGRESS OF PHARMACOPŒIAL REVISION.*

JOSEPH P. REMINGTON, CHAIRMAN.

Professor Gathercoal is responsible for my presence in Chicago at this time and I appear before you with pleasure. The making of a Pharmacopœia is constructive work by a large and representative committee and it is not *my* Pharmacopœia.

As the final work of the Revision of the Pharmacopœia approaches, it must be understood that several questions are in abeyance. At the beginning of the work of revision, it was realized that the Ninth Revision would be for several reasons the most important in the history of the work. The passage of the National Food and Drugs Act and State legislation have enlarged greatly the scope and usefulness of the Pharmacopœia and of course the responsibilities of revision are much greater.

At the Pharmacopœial Convention held in Washington it will be remembered that a recommendation was made that publicity should be given to all changes in standards and descriptions before the issue of the work. The principle of this recommendation was mainly to give to manufacturers, dealers, pharmacists, and physicians a full opportunity to comment and criticise. This principle of publicity has been in force in the United States for a number of years. When a law is proposed in Congress, or even after it has passed one or two branches of the Government, it has become the custom to invite parties interested to attend what is called a "hearing" before a congressional committee, the object of which is to obtain information from all sides as to the practical enforcement of the law. In this way important amendments may be made to the law and this may now be termed one of the principles of the American form of government, and it is most essentially different from acts passed in a parliament, a reichstag, or the mandate of an emperor. In republican forms of government throughout the world, hearings and consultations with experts and interested parties are being recognized as essential to good government.

In the Revision of the United States Pharmacopœia, hearings have been already held; in fact, the present Pharmacopœia is being thoroughly revised in public. When Dr. Charles Rice published the Digest of Comments on the two previous Pharmacopœias, he foresaw the advantage of gathering criticisms and comments from all sides. This he published in book form and anyone interested could procure a copy by applying to him. The Eighth Revision has had the advantage of a Digest of Comments published by the Public Health Department of the Government by which the principle of publicity was greatly extended.

*Read before the Chicago Branch, Feb. 16, 1914.

Of course, it will be impossible to embody every bit of advice which is now in the hands of the Chairman of the Committee of Revision. Many of these show great variance of opinion; individual likes and dislikes abound. Many of the comments and criticisms are founded on insufficient knowledge and experience, as anyone could easily suppose would be the case—an increase in one or the other ingredients, a different mode of filtering, the elimination of a tendency to precipitate, the preference for a different flavoring, and other changes of minor importance.

The present Committee of Revision were confronted with an enormous task and now the work of making a selection, which, in their opinion, is the best, is occupying much attention and an embarrassment of riches confronts the Committee. In former years, when the Pharmacopœia was once issued it was the habit to wait five years before making any material change through the publication of a supplement. Of course, any errors were corrected immediately, but very few additions or changes in admissions or deletions were ever made; but ten years is entirely too long to wait for a new Pharmacopœia and it is proposed to make changes in the future more frequently in order to keep the Pharmacopœia abreast of the times. This will undoubtedly be done in the future, but we must attend first to the issue of the new Pharmacopœia as promptly as possible before a definite decision is made as to this part of the work.

The most important questions now pending are the tests for volatile oils, for whisky, and a few additions and deletions. The scope of the Pharmacopœia has occupied a great deal of time and there are a few subjects still awaiting final decision. The inclusion of Mercuric Chloride Tablets with a selection of the most desirable form for their administration to prevent possible accidents is the question of the hour. A decision has been reached to admit these tablets, but the best way to prevent the disastrous accidents which have been so industriously set forth in the public press has stimulated the inventive faculties of manufacturers to such an extent that the Committee is confronted with a great mass of detail. Manufacturers have vied with each other in putting upon the market many forms of tablets and a great variety of containers. The subject is exceedingly important.

One of the latest duties referred to the Committee of Revision has been the formulating of an official declaration of what constitutes a poison. Undoubtedly this question has been before the world for centuries.

A poison, in the common acceptance of the word, is a substance that produces a deleterious action upon life; but this definition is too broad and general to be serviceable in food and drug legislation—a lawyer would like to have a more specific definition. The Pennsylvania Pharmacy Law defines a poison under Section 10 as follows: "A poison in the meaning of this act shall be any drug, chemical or preparation, which, according to standard works on medicine or materia medica, is liable to be destructive to adult human life in quantities of sixty grains or less." The danger in specifying sixty grains or any definite figure lies in the fact that the limit cannot be justly or accurately fixed. Why not make it sixty-five grains or a hundred? Would a substance not be a poison if it were proved that cases were recorded in standard works on medicine or materia medica if sixty-five grains or one hundred grains have been safely administered? And

again there comes the question of idiosyncrasy; some patients will tolerate enormous doses of a substance which would prove fatal to others even if administered in one-half the quantity. Would it be just to prosecute anyone under such circumstances? If a definite figure is adopted, injustice will be sure to follow, and yet it must be admitted that there is great necessity in having a definite figure. The Revision Committee must thrash out this question and reach a decision. This illustration furnishes a type of some of the problems which require settlement and, which ever way the question is settled, criticism is sure to follow.

The admission to the Pharmacopœia of substances known as protected, proprietary, or patented, has caused considerable discussion. It is universally admitted that a pharmacopœia should not advertise the products of one person, firm or corporation. Unjust discrimination would be charged and a precedent would be established and other persons, firms or corporations would demand recognition. How could a pharmacopœia provide tests for an article over which they have no control? The manufacturer would change at any time his tests or even the color of his product as often as he wished and make the pharmacopœial tests obsolete. But suppose the manufacturer of a protected substance consents to its introduction into a pharmacopœia under tests which he approves; he is virtually abandoning his control. The obstacle here is an insurmountable one, for no manufacturer yet has consented to forego the profits which he is enjoying from his protection for the sake of encouraging his competitors. The sole object of patenting or copyrighting the name is to gain profit by excluding competition. In our present Pharmacopœia, acetphenetidin was introduced as a coined word to avoid the use of the protected name "phenacetin." The manufacturer made no objection officially because his patent had a very short time to run and the question was met by marketing it under both names. This case was exceptional, but if a manufacturer had fourteen years protection ahead of him, it would seem to him a foolish piece of business to surrender his profits for the questionable honor of having his product admitted to the Pharmacopœia and losing the complete control of the tests for proving the identity and purity which would follow the surrender and opening the door for unlimited competition.

I will be glad to answer any questions which I can and receive whatever suggestions you may offer and they will be sent to the appropriate sub-committee for consideration. In work of this character an individual member of the Committee cannot hope to have his ideas always adopted. The combined judgment expressed by a majority vote must prevail. This method of revision, while both Republican and Democratic, is also Progressive.

Systematic methods of procedure in working out the detail are used, and, as the final days of revision are here, definite decisions must be reached. Let us hope that errors of judgment will be absent when the book appears. While discussion has been free and very earnest and impressive arguments have been used by individuals, the Chairman is glad to report that an excellent spirit and feeling exists in the Committee as expressed through the official circulars, letters and bulletins.

"THE PHARMACOPŒIA: ITS LIMITATIONS."*

MRS. ST. CLAIRE M. RANSFORD-GAY.

That the present outlook for the drug business is a serious one, is not denied by even the most optimistic, and the great decrease in prescription work, as well as general drug sales, has been laid to everything, from the tariff down to the dispensing doctor and the patent medicine man, but as the condition has gradually grown worse, and looks as if it was receiving sufficient nourishment from somewhere to make possible its continued decline, it is only fair to assume that as yet the crux of the situation has not been reached, or at least some of the causes for which pharmacy itself is directly responsible would be corrected and a few of the errors removed.

In holding others guilty in even a measure, for pharmacy as it exists today (and exists is used advisedly), has pharmacy placed the blame where it really belongs? To me it appears that it has not. It seems that none who could aid in the regulation has had the courage of his convictions in placing a few responsibilities where reformation is sorely needed, or the U. S. P. would not be ten years behind the times, and the N. F. a book of poor duplicates of proprietary preparations, instead of each being a living testimonial to the professions both of pharmacy and of medicine.

The dispensing doctor is responsible in a large degree for the decrease in prescription work, and until the medical schools wake up, and really teach their men that drugs intelligently used do give results today as well as years ago, just so long shall we have the 20-drug doctor, who does not even write prescriptions for these but is a most ardent follower of the label and literature supplied by the detail-man, and while we feel that the doctor who allows the detail-man to prescribe for his patient is not entitled to respect, still he is no worse than the pharmacist who buys rather than makes his own pharmaceuticals.

That we know such conditions exist in both professions is substantiated by the fact that a certain large manufacturing house finds it profitable to run a post-graduate course for its employees in order to keep them abreast with the newest in medicaments, and equally alive to the best methods of employing the older drugs. These salesmen go out, primed with the newest ideas, canvass the medical field, and supply to medical men information which they utilize, all of which relates to that particular firm's application of the newest experiments in medicine and surgery.

Does the U. S. P. do likewise for the retail pharmacist? Can we confidently turn to the U. S. P. and learn the best way to dispense, the origin, and use of the newer drugs, or even the older ones? No we cannot, but we could if the U. S. P. had a national laboratory where pharmacy might work hand in hand with medicine and surgery, and so be able to supply the best drugs, in suitable form and elegantly dispensed, as the standard and official preparation of its class.

* Read before the New York Branch, Jan. 12, 1914.

Then would the pharmacist be able to fill with confidence any prescription that is called for, he would know that it was the concerted product of many scientific minds, regardless of overhead expenses, rather than the formula of one man, no matter how clever, who must consider the great item—expense—perhaps to the detriment of the preparation. Were it not for the drug journals and their willingness to help pharmacy, we should have no book to which to refer, when information concerning newer remedies is requested and necessary, but even these publications are at the mercy of the manufacturer, and can tell only what the originator of the preparation cares to make public,—so, that even these sources are not really adequate, and as events have proved, these are times when the manufacturer has exploited most carefully all the good points of the preparation but entirely neglected to mention the precautions to be observed in its use, which are equally as important.

At the present time pharmacy is entirely dependent upon medicine, but if pharmacy is a profession, why look to medicine for sustenance. At best, in the present, pharmacy acts merely as a vehicle for the ideas of others, it does not originate nor create of its own accord. Consequently it is the servant of those who do create. The opportunities for us to know absolute facts exceed by a million those of the doctor—for we can start with the knowledge of definiteness, and step by step as the process elaborates quantitatively determine our results.

Why then should the pharmacist allow the opportunity to prove his ability slip by? If through lack of education, then improve the course; if because of the non-existence of a national laboratory that can furnish monthly digests which will keep pharmacy abreast with the progress of medicine and surgery, then it is time that the pharmacists of the United States get into action and demand that some of the national money wasted on other things be directed to the establishment of such a laboratory, in order that pharmacy may retrieve itself, and be as it was originally intended to be,—a help to mankind.

That doctors want elegant preparations, has been demonstrated beyond a doubt, and their liberal prescribing of preparations other than those of the U. S. P. proves their complete disregard for the book. They consider it obsolete, which is emphasized by many facts, among which may be mentioned—fluid-extract of ergot—it is only of late years that any except that of one manufacture has ever been used, and even now does the average doctor ever think of using any except the ether and chloroform of the same manufacturer? No, because ether and chloroform to be acceptable for anæsthesia, must be highly purified, and in spite of this fact, the U. S. P. allows an appreciable amount of water and alcohol, and as this appears to be of great moment, it is not lost sight of by the firm's detail-man, and physicians, after his learned explanation, are afraid to use any but his particular product. So true is this that books on medical jurisprudence fail to recognize any other brand.

It may have been true in earlier days that there was only one brand of ether or chloroform, suitable for use, or even but one fluidextract of ergot, but it is just as reasonable to suppose, that today this is a fact, as it is to suggest that only one pharmacist can make a quinine pill.

If the guarantee of the U. S. P. amounts to anything, then any product turned

out by any reputable manufacturer and labelled U. S. P. should be acceptable. Also why the necessity of going to court to prove that hexamethylenamine is the same as the proprietary preparation? If on the other hand the proprietaries are advertised as being identical with the U. S. P. the results obtained should be the same, and clinicians should not be disappointed, as they frequently are.

What requirements are necessary in a preparation to make it official in the U. S. P. instead of the N. F.? Why is Elix. Aromatic in the U. S. P., and the complete line of similar preparations, equally as important, in the N. F.?

The value of the coal tar products is an established fact, but there is no effort on the part of the U. S. P. to introduce or do research work on these, and with the exception of the introduction into the book of a few products upon which the patent rights have expired, there has been, not even a feeble attempt to offset the manufacturer in this direction and help the retail man so that he does not have to pay a most exorbitant price for something, of doubtful as well as known value, whose popularity is obtained primarily through good advertising.

It is time the U. S. P. became modernized, and since it has duplicated so many preparations of the manufacturers, it might be well to take a few hints as to their methods of creating a demand for the products by letting the physician know that the book contains all that is up to date and that the preparations are thus standardized and officially guaranteed.

Also, that the tests, methods of preparation, and general dispensing notes be made so explicit, that all pharmacists can with ease produce a uniform product. Then will the legitimate work of the true pharmacist be restored, and the manufacturing man no longer usurp it, nor destroy the ethical relations of pharmacy and medicine.

Our stores will resume their proper position in the mercantile world and many of the sidelines now indispensable through lack of real pharmaceutical business, will be discontinued not only to the advantage, but with the hearty approval of pharmacy.

THE CULTURE OF THE EDIBLE MUSHROOM (AGARICUS CAMPESTRIS) AS A HOBBY FOR THE RETAIL PHARMACIST.*

A. J. KLINE, MINNEAPOLIS.

Before relating my own experience in connection with the study and culture of the mushroom, it may be well to briefly refer to the subject in a general way.

When one asks the question as to which wild mushrooms are safe to eat and which are poisonous, a very common answer is that they may be divided into two classes, first those which are "Deadly Poisonous!" and second those which will "Kill Sure!" The average person is not inclined to test the edibility of the numerous wild sorts, and those who are possessed of some knowledge concerning those suitable for the table will usually shun inquiries or answer "yes" or "no."

* Read before the January meeting of the Northwestern Branch, A. Ph. A.

These quite general conditions are undoubtedly the prime cause for the limited use of this fine food. Most people do not realize the great annual loss of food from the non-consumption of the edible fungi. The fact that the average person is not able to distinguish between the different varieties and hence eats none at all is without question a very fortunate restriction.

As a matter of fact there are very few, *very poisonous* mushrooms and these belong to the genera known as *Amanita*. Those of this group which are most toxic are *Amanita phalloides*, *Amanita verna* (said to be a form of *A. phalloides*), *Amanita muscaria* and *Amanita solitaria*. The last named species is said to be edible, but according to Clements "it is dangerous on account of its resemblance to the poisonous Amanitas and every one should avoid all risks by leaving it entirely alone."

There are a number of fungi which while not deadly poisonous contain power-

Fig. 1. The common wild mushroom (*Agaricus campestris*). Fully developed fruit bodies, the gills are clearly seen as is also the membranous ring or annulus on the stem.—
(After Freeman in Minnesota Plant Diseases.)

ful emetic principles. These include such as *Lepiota morgani* and *Clitocybe illudens*. It is interesting to note in this connection that a peculiar idiosyncrasy exists in certain people who are not affected by the emetic principles.

Altogether, there are from three to four hundred different species of mushrooms which are known to be edible and from fifteen to twenty which are poisonous. Then there are many others which as yet have not been tested, leaving an opportunity for any who may desire to make martyrs of themselves.

Before proceeding to indicate some of the characteristic danger signals of the poisonous mushrooms, it may be well to call attention to the various parts of the mushroom plant. The plant body proper consists of numerous thread-like cells which ramify the soil or compost in which the plant is growing. These thread-like cells or hyphæ are known collectively as the mycelium and from the mycelium the upright branches arise which we call the toadstool or mushroom. The mushroom is the fruit body or spore-bearing-organ and usually consists of several well

differentiated parts. First a stalk usually spoken of as the stipe and which may be enlarged at the base and sometimes enclosed in a short cup-shaped sac called the volva. Upon the stalk there develops a more or less umbrella-like portion known as the pileus which varies greatly in shape and size depending upon the age and species. On the under surface of the pileus, which is known as the hymenium, are developed the gills or in some species these gills are replaced by teeth or pores. Upon these latter organs the spores are produced. When the mushroom first makes its appearance above ground it is in the form of a more or less rounded head which is spoken of as a button. At this early stage the gills are usually covered over with membranous tissue known as the veil, later

Fig. 2. *Agaricus campestris*, a cultivated variety grown by Mr. A. J. Kline from pure culture spawn.
(Original.)

the veil becomes ruptured leaving a more or less distinct ring around the stipe or entirely disappearing.

The following rule concerning the selection of the edible fungi has been given by an expert on the subject: "Avoid eating all mushrooms with white gills, a ring around the stem and a cup or scales at the bulb-like base of the stem, to be in no danger of fatal poisoning. Since the volva, especially when scaly, disappears with maturity and sometimes the ring also, care must be taken to apply this rule to young plants." The collector should also be on guard for the species which contain emetic principles, for while they are not deadly they may cause illness. Finally unless one is an expert on the subject it should be a fast rule to give no advice to others on the edible qualities of any specimen.

The culture of the edible mushroom is becoming more and more a subject of general interest and while there is nothing difficult about the work many fail

from lack of adherence to certain general rules. Five conditions are very essential for the successful cultivation of the edible mushroom, viz.: reliable spawn, properly prepared compost, temperature, humidity and fresh air. For the cultivation of the mushroom the compost must first be prepared. Fresh horse manure is the most suitable material to use for the compost. The manure should be moistened with water until it is uniformly damp and so that water will not run out when squeezed. It should then be thoroughly mixed and put in piles three or four feet deep. In seven or eight days the compost will have become quite hot by fermentation brought about by the action of bacteria. At this stage it should

Fig. 8. Morel fungi (*Morchella esculenta*). The ridged caps are to be regarded as everted cups, whose surface has become ridged and hollowed to afford large area for spore formation.

(After Freeman.)

be spread out, re-moistened and piled up again. This process is usually repeated again at the end of the third week, at which time any straw or coarse litter in the manure will be soft and pliable.

The compost is now ready to be placed in the beds or boxes. If beds are made they should be of such size that one can reach to the center from either side. The moist, but not wet, compost should be placed in the beds and firmly packed down to a depth of ten or twelve inches. A thermometer should be placed in the compost and when the temperature drops to 75° F. the bed is ready to spawn or plant. The temperature best suited for the growth of the spawn is between 55° and 65° F. Ordinarily the cultivation of the mushroom should not be at-

tempted during the hot summer months, owing to the presence of insect pests which are very apt to make the mushrooms wormy and unfit for use.

The spawn consists of dried compact masses of turf or compost, containing mycelial threads of the mushroom. Spawn is a commercial article and a number of different varieties are offered. One form which earlier was much in use is propagated directly from the spores. The spore culture spawn does not seem to yield as uniform and satisfactory results as a product of later introduction known as pure culture spawn. This latter spawn is produced by vegetative reproduction and selection which assures the constancy of the variety or strain. One of

Fig. 4. Shaggy-mane fungus (*Coprinus comatus*). This is an inky-gill fungus. The cap is seen to be blackened at the base, where the whole substance of the cap deliquesces and drops its black spores in an inky mass.—(After Freeman.)

the best pure culture spawns is prepared in St. Paul and known as Lambert Pure Culture Spawn.

The spawn should be broken into pieces from one to one and one-half inches square and these pieces should be placed one or two inches below the surface of the compost, the pieces being about a foot apart. After the spawn is planted the compost should be firmly packed. If the compost and spawn are in the proper condition the plant will begin to run in from a week to ten days and innumerable mycelial threads develop throughout the compost. The bed is now ready for "casing." This consists of placing over the compost a rich loam covering from one to two inches deep. This casing should be firmly packed down, but no watering should be done at this time. An excess of moisture will kill the mycelial

threads as the mushroom requires a large amount of oxygen which it derives from the air and at the same time the plant gives off a large amount of carbon dioxide. This process is just the reverse of that which takes place in the manufacture of food by plants which contain chloroplasts, although in the process of respiration CO_2 is given off by the higher plants. The failures of beginners are usually due to a lack of fresh air or to too wet compost, either condition resulting in a deficient amount of oxygen for the growth of the fungus.

The humidity should be just about at the point of saturation and should remain so. Damping off sometimes occurs and this is usually due to sudden changes in

Fig. 5. The shaggy-mane fungus (*Coprinus comatus*). This fruiting body is in a more advanced stage of deliquescence than that shown in Fig 4; almost the entire cap has dripped off. A ring (annulus) is seen at the base of the stalk. (After Freeman.)

temperature or too much moisture. The great amount of CO_2 given off necessitates a good system of ventilation; as the CO_2 is heavy and will settle to the lower layers of atmosphere it is sometimes possible to arrange so that it will run off through a low door, window or pipe. A vent pipe having some draft will usually remove the excess CO_2 satisfactorily.

Mushrooms will not grow in wet, unclean places where the air is vitiated. There must be an abundance of fresh air along with other suitable conditions. The plants will grow in the light as well as in the dark, a dark room not being essential but most desirable owing to less danger from insect infection. The best time to collect the mushrooms it is at the time when the veil is about to leave the pileus. Some growers allow them to develop more before collection as the

weight increases very rapidly; the quality however diminishes. After six or eight weeks of collection the soil and compost become exhausted and the beds must be cleaned out, disinfected and rebuilt. In the collection it is preferable to pull up the mushroom by twisting motion rather than to cut it with a knife as this latter process leaves a portion of the stipe which will decay. After collection they should be cleaned and trimmed and if to be marketed packed in boxes or baskets of from one to three pounds capacity. Mushrooms may be safely shipped by parcel post and at present the demand seems to be in excess of the supply.

The food value of mushrooms ranks well with many fruits, although they are not in the class with highly starchy or highly nitrogenous foods. For those who wish to grow mushrooms I would recommend the planting of some of the pure culture strain of *Agaricus campestris*, yielding the common mushroom, or of *Morchella esculenta*, the common Morel, which I believe is being offered in spawn form at the present time. For home consumption the shaggy mane or *Coprinus comatus* is much employed by some. The specimens I have here represent a strain of *Agaricus campestris* that I have grown in my cellar. The study and culture of the plants not only gives me much pleasure and recreation, but I also have a continual supply of this delicious food for the table.

WINDOWS AND WINDOW DRESSING.*

ARTHUR C. SCHULTE, PH. G.

It seems strange, if not absurd that anyone in any line of business in the commercialized world of today, need be told the value of window dressing as it is so evident on all hands. It would look indeed strange to the most casual observer if he did not see the windows, principally of the department stores and tailoring establishments, dressed as they are today. If one would stop to think of the enormous amount of money expended in window-dressing week in and week out he would be forced to say, "There's a Reason." The druggist today in business who does not give his windows their proper attention is either indispensed, due to lack of ambition, or else he is merely running his store as a convenient place of address. It's a fact that some druggists will sit on their chairs with their hands in their pockets, smoking a cigar and say, "What's the use?" But if you look around their stores to see the condition of things as well as the stock, you will have little cause to wonder why their business is going back-

wards or why they will always complain of business being "on the bum." Druggists in business today with ideas of twenty years ago have no business being in business. They have lost their place. They are holding back, as it were, opportunities which if allowed to develop would count as dollars and cents on the cash register. The men who say that their customers would not stand for the new ideas in business, and that if they did introduce them they would lose their trade are out of luck, and generally this argument is merely a mask to hide behind the cloak of indifference. The druggists who rely on a patronage of twenty years ago are working under a delusion, for while an established name is an adjunct to any business, still that patronage dating that many years back has passed away, and the new blood that takes its place demands the new order of things.

Here is an idea of the store of twenty years ago doing business today that came to my notice. On the ground floor the windows were made up of many small square panes, several of which had been mended with

*Read before the St. Louis Branch of the A. Ph. A.

newspapers. Through them one was almost able to distinguish the interior. In the foreground stood a broken bottle shaped like a mortuary urn and half full of pink liquid. Besides it reposed a broken packing-box in which bleary camphor-balls reposed between faded sheets of blue paper. Of these a silent companion of misery stood on the far side of the window—a towering pagoda-like cage of wire in which were trapped, doubtless, by means of some mysterious bait (known only to alchemists) three worn but brutal looking sponges which were apparently slumbering in exhaustion. Back of these a dirty plaster cast of a male figure lightly draped seemed to represent the survival of the fittest over some strange and deadly patent medicine. The recessed door bore an inscription in gold letters, tarnished and half obliterated:

RANK G HAM
RUGS & HEMIC LS
PR SCRIPT ONS CAR FULY
C POUND D.

The interior needs no description. Here is an idea of what some druggists will say is known as an old land-mark and if changed, the patronage would drop off. Do you believe it? I do, but I would say that it has dropped off so long ago that nobody knows that it ever existed.

From an advertising standpoint, I hold that there are no mediums, such as newspaper inserts, circulars, calendars, almanacs, etc., so powerful, for the moderate or small business man, such as the druggist, or so comprehensive or so satisfying to the prospective purchaser, or so economic to the druggist as a well-dressed window. If one-tenth of the money spent in other methods of advertising was invested in window dressing, I believe that windows would rank first as a medium for increasing business. Of course, other means are sometimes necessary, but the window is the link and should be the connecting link, bringing in the purchaser, in the great chain of advertising. It is the link that serves as the last impetus to bringing in the new customer. Lots of money might be lost and is lost, because of the lack of properly dressed windows where the individual can actually see the articles that have been advertised, as the decision is made then, and nine times out of ten the sale is completed.

I ask you why is it that these big manufac-

turers will spend thousands of dollars in the newspapers in launching a new article, especially a patent medicine and then will come around and inquire whether they can put in a window display and in some instances even offer to pay for the window. Why is it? It's because these men, trained by experience, know that the last place, the jumping off point as it were, for the sale of their articles is the druggists' windows, and if seen there will serve as the last reminder of what they have been hammering at in the newspaper. Do you know, that some downtown drug stores receive from \$50 to \$100 a week for the loan of a window? And that this much is paid to the proprietor to bring purchasers into his store? Do you think these men have money to give away? I should say not. How much are your windows worth?

The value of a window that is well dressed does not lie especially in its attractiveness from an artistic standpoint, but mainly in its pulling power, the power to attract and hold the passer-by long enough to convince him that he really needs the displayed article; or else that it will serve to indelibly write on the individual's mind the fact that Mr. So and So keeps that article, displayed, and especially at the right price, and when he needs that article he will buy it there. The length or duration of the effectiveness of a display has never been, nor is it capable of being computed. For example: A display that I put in the window last May was brought to my attention in November by a customer asking for a can, a red can for bed-bugs, that he had seen in the window some time back, he didn't remember where. At once I knew that he had reference to a display of Bug Killer that I had displayed in the window in the before mentioned month.

Displays of such articles as brushes, combs, writing-paper, shaving mugs, mirrors, etc., and such other articles that ordinary purchasers look to the department stores for when they need them, will serve as a reminder that you keep them, and long after a display is removed you will get a call for some article that you had displayed months previous. In the case mentioned above you can contrast the effect or force of newspaper advertising, or what the effect of a one-time insertion in a newspaper would be as compared to a one-time window display. The window is the mainstay of the small or large druggist who believes in doing a little more

business. Some men, purely ethical, might criticise the display of combs, brushes, or other sundries in the windows of drug stores. That might be all right, but the druggist today cannot, conveniently, be too ethical or he will be crowded out by his competitor. It is a deplorable state of affairs that the present day druggist has to resort to sundries to make his business pay, but the people ask for them, demand them and the requests today are almost unlimited. The other day a lady asked me if we sold fruit. I told her no—then she said, "Oh! well, I guess I will take some cakes." I told her we didn't sell cakes. She said, "Oh! do you only keep candy?" This is a true incident and only shows the trend of the druggists' business. And why shouldn't the druggist handle anything and everything that is profitable as long as his trade demands it? As conditions now are, almost all of the druggist's prescription business is cut off by the dispensing doctor, and the bulk of his drug trade by the department stores (the ten-cent stores have taken away our last staple seller, Peroxide of Hydrogen, 1 lb. at 8c), he is forced to look around for added means of a livelihood. I think it is just as well to sell a woman a box of paper at 25c and make a few cents profit as to greet her with a smiling countenance when she asks you for five two-cent stamps to mail some letters, the material for which she has bought down town.

Window dressing is an art, and unless the window dresser has some artistic temperament the best way for him to dress a window is to leave it alone. The best system for finding out which one of the clerks is the best window dresser is to try-out first one and then another. After they all have had their turn, pick the one you think is the best, and let it be known that from that time on it will be his duty to dress the windows. Of course, you do the choosing as to what you want displayed. It is then left to the individual to develop within himself the latent temperament. So many boys, or I should say young men, have asked me, "How do you do it?" not in the sense of praise, but for the sake of information, pure and simple. They ask me if I think a course of instruction in some correspondence school would make them efficient as window-dresser or whether it would be a good thing, and so on. As you know, various schools realizing the value of window dressing as a field for ac-

tivity, have included a course of instruction in window dressing, but believe me, no window-dresser can be made, and these courses are worthless unless the artistic capacity is inherent in the individual. The window-dresser can be improved, or perfected, possibly, by such a course, but that is all, and at that, a chance. A good window-dresser will profit more by experience and practice than by any other means. We say, to use a popular expression, that "So and So" has a "knack" of dressing windows and that really is the truth, the knack of doing it.

The good window-dresser profits by observation, and suggestion as well. In going around he sees other windows and at once ideas are suggested. If he is a true artist he will not copy, but change according to his own notions, and the new creation is then stamped with his own individuality. It has been said and truly that the window is the eye of the drug store, and like the 'eye is the window of the soul' in the human being, so the soul or interior of the drug store today shines through the window, and it is a safe bet that the well dressed and up-to-date window will show a modern store on the inside, and a poorly dressed or neglected window will show a neglected or behind-the-times store on the interior. Remember, that the man today who is prosperous shows a clean front, and by keeping a clean front, a well-dressed front, he is advertising his business methods, besides reaping the profits thereby. In going through any business section, you don't have to be told which store is clean on the inside, and which store keeps a complete stock. You'll look at the windows and decide for yourself. And that is what others do about your store.

In dealing with windows, there are two kinds to take into consideration, namely, the open or unprotected window and the enclosed or protected one. To dwell on the open window is a waste of time unless by so doing we can convert the owner of such windows, and convince him of the folly of attempting to make displays in the open window as offset by the thousand-fold possibilities of the closed window. The man who is interested enough in his windows to dress them will not tolerate for any length of time the open window, or will not remain long in ignorance of the fact that he is wasting his time, if not money, in bothering with them as it is impracticable to display perishable goods, which are generally

the ones necessary to display. He will also find that he is losing money as he cannot display profitable goods as the material at hand is generally in the form of folding cartons from patent-medicine houses, or cigarette displays from the various tobacco houses. The open window is unprofitable from the standpoint of soiled packages that after being displayed must be destroyed or sold at a sacrifice to get rid of them. Take for instance writing-paper, face powder or even rubber goods and display them in an open window. The material or products themselves are not harmed, but the containers are, and no one can tell me that a box of writing paper or face powder will sell very readily or satisfactorily that is marked by the peculiar tendencies of an open window display. In summer the flies and dust are the main items to take into consideration, and I wonder how many new comers will have their palates tickled by the display of bulk candy in an open window, where the flies and bugs are having a royal contest for supremacy, coupled with the dust that is blown in the open door at the passing of a street-car or the blowing up of the wind.

Of course, the closed window might have its objections, but they will be outnumbered by the open window. It has been said that the closed window causes sweating, and that the moisture condensing runs down and ruins some part of the display. This might be true, but if the proper precautions were taken, there would be no sweating, and consequently, condensation. The problem resolves itself into a pure one of physics. We know that moisture will collect on the outside of a pitcher of ice-water—why? Because of the difference of the temperature inside and outside the pitcher. The remedy for sweating windows is to equalize the temperature. Have the temperature inside the window the same as the temperature outside, and there will be no deposit. This can be accomplished by having the lower portion or floor of the window bored with holes connecting with the transom of the cellar. This will supply you outside air. Also at the top bore holes or make a ventilator opening, connecting with the outside air. This will produce a current of air and the cold will come in and rise, driving the warm air out at the top. And I would like to know what prevents the open window from sweating? We had open windows and they sweated; our doors sweat

today. The temperature surrounding an open window cannot be regulated as you have no confined atmosphere. In seeking to remedy the sweating open window you will have to equalize the temperature of the whole store, which virtually means throwing out your furnace or stove in the winter.

The problem of sweating-enclosed-windows, even if for the sake of argument it were impossible to do away with, is better than the open window which, we also will grant for the sake of argument, does not sweat, as you have a longer period, say nine months, in which to display perishable goods as contrasted to three months of the sweating period. The problem of generated heat in the closed window in summer, as some will say, is without foundation, as a closed window with proper ventilation is bound to have the same tendency in summer, in which instance one can place a fan under the window and then the circulation of air is assured.

I am going to spend a few moments on figures that should interest the open-window proprietor. Our windows are approximately 7 x 6 feet in height and width and about 3 feet deep. Being tired of the open window, I took it upon myself to enclose them and proceeded as follows: Having brought the floor of the window up to the pane margin I took two uprights and one cross-piece of 2 x 2" lumber and placed them at the back of the window to the required depth. I drew in the uprights six inches on either side and reduced in length the cross-piece, 12 inches, thus making the back edge or frame of the window one foot narrower than the front, or five feet, and the height of the back six inches shorter than the height of the front, forming a drop of six inches, making them six and a half feet in height. Then I put on the top, using one-inch yellow pine flooring. Then I put in the sides, allowing for windows almost the entire length and width of the side, say 5 x 2½ feet. Then I used two uprights of 2 x 1" and placed them equi-distant from the sides at the back, marking the width of the door. Then by using two cross-pieces three feet long of 2 x 1", I made or finished the casing for the door by placing them equi-distant from the top and bottom. Then the remaining upright and cross sections were again divided, forming panels, which were glazed, thus giving a full clear view into the inside of the store. Then by

using some quarter-inch quarter-round molding and putting in the glass, I had a window that was neat looking and absolutely dust-proof. The door I had made at the mill to make sure of being accurate, and used the hinge method to fasten it. This work was done at an approximate cost of \$12.90 for two windows, a price that I believe is pretty reasonable, not counting the labor. I also bored holes in the floor as mentioned above, for ventilation.

The interior I finished in white, using four coats of white lead and two coats of zinc white and two coats of zinc white and damar varnish mixed. The exterior was finished to conform with the finish of the store, which was cherry. White, I believe, is the most desirable color, as it reflects the light, thus serving a double purpose. The usual objection raised that white gets dirty is a good reason for using it, as it serves as a good reminder that it is time either to wash the wood-work, or time to change a display, and thus acts as an incentive to one who is apt to become careless or negligent. This verging in of the sides and top makes a very effective window, as the whole window, top, sides and bottom, can be seen at the same angle and gives the appearance of a beveled picture frame with the display as the picture. The top and sides in a window like this make an admirable space for show-cards. But no matter how a window is enclosed, it can be made a selling factor and works toward the increase of trade.

The method, or series of display, adapts itself according to the seasons, and by that I mean that a druggist will or should make the proper displays in their proper seasons. We would not expect to see a display of fire-works in the month of December.

We know that in spring comes the blood purifiers, tonics, etc., and the method of displaying rests mainly with the individual. The display that usually marks spring is that of cream of tartar and sulphur lozenges, or syrup of sarsaparilla with iodide of potassium. Combined with the display might be shown crude sarsaparilla, various other herbs used in the formula, also the various chemicals used. This form of display will hold the pedestrian longer than any other method, besides convincing him, or at least making him think that the man behind that window really knows something about what he is trying to sell. The result of such a window

is bound to produce new customers and an increase of sales.

The next regular spring display will fall about Easter; that is, an Easter window is next in order. An Easter display will hold good for at least three weeks. Not the same display, but the same material differently arranged each week, for three consecutive weeks. And spring displays, such as soaps, perfumes, cigars, candy, will always be appropriate trade getters.

Summer, commencing in June, also brings its various suggestions for displays, particularly talcum powder, and in this season real effective displays are produced by the use of vines, flowers, and Japanese lanterns, which are reasonably priced and readily obtainable. Writing paper forms a good item in this season when the prospective purchaser is thinking of taking his or her annual vacation, and of course will need some material for correspondence. Cameras also have their play in this season, and various other sundries, such as baseball goods, swimming caps, and in some localities, fishing tackle and paraphernalia. In July, fire-works, which, however, I do not think, if averaged, will prove profitable, everything considered, such as loss of insurance, or left-over stock.

Fall brings its house-cleaning and displays of sponges, chamois, paint cleaners, wall-paper cleaners, etc., have full play in this season. Real effective sponge displays can be arranged, and I will mention one. Place in the center of the window on the floor an electric fan, facing the top of the window. Fasten red and yellow crepe streamers to the wire guard. Then arrange a red bulb, with extension socket connection, at the center of the fan guard. Now pile the sponges around the fan until completely covered, forming a mound in the center, and also be sure to cover the floor of the window completely. If handy, place here and there some shells that you may possibly have on hand, and then hang chamois skins all round the interior of the window. This will make a pretty display and produces a unique effect. At night the fan and the light are turned on and the effect will bring people from across the street or some people in the cars will remark about the window. Of course, the usual "sign card" should be displayed, announcing that "Fall house-cleaning is at hand, and that Mr. Jones keeps a full line of necessities, selling at prices not the cheapest, but

prices consistent with the quality, which anyone knows varies greatly in sponges. In this season Thanksgiving Day affords an excellent opening for an effective window.

Winter now comes, and the windows in this season are either too small in size or too few in number to display the innumerable holiday suggestions that may be carried the year round, but which at this time have to be featured. Christmas, with its multitude of "Practical Suggestions," affords the window-dresser the same opportunity as the bargain hunter on a rainy day. Christmas displays should commence the first of the month and, of course, last until the first of January. In this season the best idea is obtained of the trade-pulling qualities and increased sale facilities of well-dressed windows. Most druggists say that the Christmas season makes little difference to them, but they are the men who don't go after the business, and nine chances out of ten are druggists who don't attempt to dress their windows. The bulk of Christmas trade is brought in through the use of the windows, and to the druggist who has an increase of from \$800 to \$1000 in this month, this means a good deal. This is the time when closed windows mean money with a capital "M."

During January, you have your cough and cold mixtures to exploit; your backache plasters, hand lotions, face creams and what not. In February comes "Valentine Day," and here is made possible a profit of from 100 percent to 200 percent on an investment of two weeks' time. Pretty good! And if a druggist sells \$100 worth he knows he has sure made \$50. Here you see is your closed window again. How long would "Cupid," as pictured on the valentine, be able to hold his dart in the face of the furnace smoke and the floor sweeper's dust? He would bow his head with dust in shame at the end of a week, or else change color with the mortification of the indignities thrust upon his poor naked body.

The means or method of displaying varies according to the material at hand. In some cases the "unit" system is best; in other cases the "group" system, where various items are grouped, making the display more effective. Then again, the "topsy-turvy" method is good, as in the case of a cigar display. You want to impress the smoker that you have something good at the right price. You can talk yourself blue in the face and still lose

him. But you put this same cigar in the window, even if it is only one full box shown open, and throw promiscuously around on the floor of the window empty boxes or cans and write a card that "Here is the sale of the empty cans, 5000 sold in one week. There's a reason." You will have him in your store in less time than it takes him to read the sign to try one, for seeing is believing, and you have convinced him, if he is not too skeptical, that they are selling by showing the empty cans. And you make the sale, possibly, without uttering one word. This method is especially good on a transfer corner.

The best idea in dressing windows is to feature one article. For example, take talcum powder. In dispensing talcum powder I feature talcum and talcum only. Get the idea fixed and hammer it in to the individual that you are selling talcum and, if a special talcum, feature the best points over other makes, but most of all, feature talcum. Some stores fill their windows week in and week out with a conglomeration of articles, including everything from A to Z, and impressing, to my mind, the observer, as being a curiosity shop. This forms what is known to window dressers as a junk shop display and will only serve as a detriment to the store employing it. It is wrong, and there should be no excuse for it.

A good idea of the group display is shown in a window dressed with shaving supplies. Here you have shaving mugs, lather brushes, soaps, shaving sticks, powders, creams, strops and everything relative to shaving. But the main idea to the observer is that you have "shaving supplies" and that is the feature you are trying to impress upon him. As an added feature to a window of this character, you can cover the floor of the window with shavings obtained from some packing case. Put up your sign "Shaving Materials" and your window will move the goods. I know it because I have tried it.

Ethical displays, pure and simple, are unprofitable from a pecuniary standpoint, but may add to the local prestige of the proprietor. However, in the present day of commercialized pharmacy I believe that an ethical display by itself is impossible, if one wants to be very technical in discrimination. Ethical features, however, sometimes added to windows are good added attractions, such as a filtration process, or a percolating stand,

or even a distillation process. Then various items from the laboratory, if placed in a window, showing the working process of a preparation from its inception on through until it is finished, is good.

I cannot understand how any well-meaning druggist will fill up a window with such items as suspensories, trusses, syringes, abdominal supporters, and other various appliances that are known only to the needy and not needed by others. There isn't anyone who can convince me that a man will buy a suspensory or that a woman will buy a syringe or supporter because he or she sees them in the window. It is wrong and obnoxious to even the fairest minded critic. This idea, however, is not new with me, but the sentiment that I here voice is being taken care of by the legislature, showing that my view is not altogether prejudiced. Have you ever noticed a display of this kind? Did you ever stop to look in? No, and how many others do? The moment the individual catches what the window is showing, he or she hurries on, afraid that someone has seen him or her look at the window. And how does the young man feel who is walking with his lady friend and on looking up his gaze is confronted by a glaring display of suspensories, etc., or how does she feel, vice versa? They are the kind of displays that should be censured and stopped. The only ones who gather around a window of this kind are small girls and boys, kids, we'll say, and they stand there and giggle. What does it mean?

Most stores make the mistake of adopting a set form and never deviating from it. That is a bad idea. The idea to produce a display that is different is the one to be sought after; one that is not necessarily startling in being foreign to the drug trade, but one that is different from the standpoint of style and manner. Originality is the word that defines good windows, and does more good towards effective window displaying than anything else.

I can sell a hundred pounds of mint stick in a week at 5 cents a stick simply by throwing in almost the entire stock and making a dummy stick of immense proportions by pasting cartons end to end, covering with white crepe paper and using red crepe to mark the stripes. Hang this diagonally in the window—put up your sign "Big Stick, 5c," and that's all you need. Not only are

your sales increased in that week at your candy counter, but you will have produced permanent customers for that item, and possibly created new customers for your general trade.

In the matter of changing displays, I would advise that the displays be kept not longer than one week, or in some exceptions, ten days or two weeks. Sometimes I have had people who have seen me in the act of breaking up an exceptionally attractive window, produced by using vines or lanterns, exclaim, "Oh, what are you doing that for; such a pretty display." The answer is in the question. This individual, and why not the other people, who are accustomed to passing your windows, saw this display and remarked on its attractiveness. They saw the display day after day, say for two weeks. Well, then, that display has done its work, and it is time for something new, different, and maybe, better than the one before it, and then those same people will look in the window and your window commences again to do its duty.

In the matter of price marks, I will say, that sometimes they are imperative, and at other times they are inadvisable. For instance, in special sales, clearance sales or cut prices. You have a sale for the sole purpose of featuring prices; that is, the prices or cut-prices are the main reasons for that sale, and they are the items that are going to make the sale successful, and so, of course, in instances of this kind, feature prices, and feature them strongly. Sometimes prices alone will appeal to the individual and they think if the article is cut they are getting the best of you. Not long ago I filled out an order with soap, wrapped, and in boxes that ordinarily would and does retail at 5c a cake. I placed this soap in the window and put up a card, "Special, 17c a box, only two boxes to a customer." That soap went like hot cakes, and after the sale I put it in the case at the regular price, 5c a cake. No harm done, and a nice little stock moved off my hands. Also in displaying a new line of goods, or a new toilet article, anything that is new on the market or new to the consumer, use price marks. But take in the case of, say a display of hair brushes. You display an assortment of brushes valued at 25c to \$5. You put the price on every brush, but the first price that catches the eye is \$5. The individual who sees it will throw

up his hands and exclaim, "\$5 for a hair brush, my goodness, but they're high." And he will pass on and you will have lost a sale, possibly a customer. Of course, a fair-minded person will go a little further and reason the matter, but it is the ordinary individual we have to take account of, and the buying public is most ordinarily skeptical, and it's pretty hard to argue through a window glass. Grant that the brush is worth \$5, say a solid ebony back with genuine hog bristles, one and one-half to two inches long. Anyone that knows the value will concede the price. But take the same display, do not use price marks but make up a show card something like this, "Our line of hair brushes is complete, prices consistent with the quality, from 25c up." With a window like this you will get the prospective purchaser in the store anyhow—and then the sale is half made. If they want a 25c brush, you are in a position to give it to them, but you at the same time have the opportunity of talking up the better wearing qualities and satisfaction in owning a better priced brush; in fact, to employ your salesmanship. You, at least, send away a satisfied customer with possibly a dollar sale made, instead of a person who, stopping at the price-marked window, will move on grumbling at the high cost of living.

Again, take a window around the holiday season. You can put all the energy you possess, pile all the goods you have into the windows, arrange them tastily and do everything in fact to make what is known as a good display, and leave off price marks and you will lose many a chance purchaser whom otherwise you would have captured. Take yourself, for instance. If you should see an item in a window, say a bottle of perfume; you knew you could use it, knew you had a place to put it where it would do most good; still you wouldn't, nine chances out of ten, go in and inquire the price, for fear it would not be satisfactory, and would leave you embarrassed. But let there be a price on this same package, say \$1, you wouldn't hesitate long in reaching down in your jeans, if you wanted it, and marching right in with the intention of making that package your personal property.

There is one main item I want to bring out in window-dressing, and that is action. Action in a window is the greatest asset imaginable towards sale-producing qualities.

A window with action is the greatest attention arrestor of any. A man demonstrating a safety razor, a woman demonstrating a face cream, in fact, any live working model is conducive to good results. But action does not necessarily have to be human. Live rabbits around Easter time are good, an aquarium with gold fish, live guinea-pigs, or mechanical devices that show what they are supposed to represent. You have seen them all; so have I, and you know how they worked towards drawing crowds to the windows. If you are walking down the street and see a crowd in front of a window, you hasten your steps, and then, when you reach the window, you pass on, do you not? Yes, you do not. You crane and crowd and crane your neck to see what's doing. It is that quality given to us all, curiosity, that makes you want to find out what is going on. And I needn't say that in such a window there is something moving. For the last four or five years, with the exception of the last two, and then because I couldn't get any, I have put live young rabbits in the window, made small houses, and the attraction was phenomenal. At the top I advertised Egg Dyes. You might say that the window as a profit-making factor was worthless. It might have been but for the fact that each year I sold young rabbits from 75 to 100, all I could get, at a profit of from 200 to 300 percent.

In employing color schemes by the aid of crepe paper I would say, do not overlook any holidays or special occasion, such as the Horse Show, or Veiled Prophets, etc. For the Fourth of July, of course, red, white and blue; for the Veiled Prophets, use purple and gold; for the Horse Show, use green and white, and so on. No matter how far removed you are from the scene of activities, the color scheme shows your patrons that you are up-to-date, a fact that might have some bearing when they are in need of something that must be particularly fresh or up to the standard. Remember, the druggist who is up-to-date will, is bound to, get the business, and if you are in business you might as well get all there is in it. As a general idea use bright colors in spring and summer and dark colors in fall and winter.

Druggists, dress your windows. An hour spent in making up a display is worth sometimes a whole day spent in figuring and planning how you will be able to move an item that is going exceptionally slow, and then

contemplating a cut in price. A window sends the message, the purchaser interprets it, and the druggist delivers it. That's the system. "System" is the word in the world of business-getters today, and the druggist who is content to sit idly by with his hands folded, complacently waiting for the people to come in to deposit their money with him, is wrong. He is the druggist who will barely exist, or else fail altogether. Such a druggist is wasting his time, and the sooner he finds it out and improves himself, or steps down and out and gives the other fellow a chance, the better off he will be, as interest on money sometimes fails, and at that is a poor excuse for neglect of business.

Before closing there is one item I have overlooked, that comes to my mind, which, however, seems hardly necessary to mention, and that is light. Light in a window is, of course, the main attraction. Use light and lots of it. As moths are attracted by the flame, so are the people attracted by light. Light effects in windows are attractive and easily produced. In a window with lights running around the edge, very pretty light effects are produced by tying squares of colored crepe, alternating the colors, such as purple and gold, or green and red in the Xmas season. This scheme has a very good

effect and will serve to catch the eye whether the individual has time to spare or is hurrying to catch a train. Well lighted windows mean well-lit stores, and well-lit stores mean prosperous stores, and prosperous stores mean new business, satisfied customers and prosperity. Do you see it? It's easy to understand.

The druggist who dresses his windows today is the one who has judgment, good judgment, and uses it; has common sense and employs it, and last but not least, has good business ability and ideas and profits by them. Be up-to-date. The druggist today who is up-to-date, or at least who is thought to be, gets the money, and that, I believe, is one of the main reasons, if not the main one, why he is in business.

I hope this paper has been of benefit to a few or has instilled new thoughts or ideas into the indifferent, but whether you are good, bad or indifferent, you had better get in the band-wagon today and "dress your windows." There is so much to be said and done and so much that can be done that is inexpressible that I will have to leave off and beg to be excused from the floor, hoping that the many points that I have omitted will be brought out in the discussion.

CREDITS AND COLLECTIONS.

This is a good time of year to think about credits. In fact, any time of year is just splendid to think about credits, for like the poor they are always with us. You fellows with definitely formulated retailing policies have already done it, but you might be surprised to learn how many of the brethren just plod along and try to think of the right thing to do when the question comes up. They are easy-going souls who like their neighbors and don't want to have trouble. I used to number among my acquaintances a brindle pup of just that easy-going disposition. He slipped along without ever asserting himself, wagged his tail when kicked at, and seemed to try to apologize when he got stepped on. He was a nice dog in some ways and a good friend; but I always felt I should respect him more and take greater account of him in my calculations if he'd get his bristles up a little. The fellow who tries to get along with the least trouble and yields his business or his moral principles rather than risk giving offense is inviting trouble to hit him right in the eye. It's a pretty good thing to think carefully about what ought to be done in a given case before the case arises. Then when it does come a fellow has something to fall back on.—*Western Druggist.*

Of General Interest

PANAMA-PACIFIC INTERNATIONAL EXPOSITION.

CHEMICAL AND PHARMACAL EXHIBITS.

The exhibits from the chemical and pharmaceutical industries of the world will be shown in the splendid Palace of Liberal Arts at the Panama-Pacific International Exposition in 1915, and their extent promises to be as inclusive as their variety will be instructive and interesting.

The diversity of these displays is seen in the fact that soaps and perfumes are scheduled under group 36 of the exposition's book of classification and so are apparatus and processes for the compression and liquefaction of gas. Pyrotechnics, bombs and signals, together with matches, will find a logical place in chemical relationship with the by-products for pharmaceutical use obtained from treatment of petroleum and coal-tar derivatives. The evolution of the den of an ancient alchemist will be seen in model laboratories of the present with complete equipment installed.

The extent of the industrial interests that are embraced in this department is disclosed in the statistical eloquence of the United States Census Bureau which shows that there are 5,168 establishments in the United States devoted to the production of articles involved in the chemical and pharmaceutical arts, with an invested capital of \$419,930,000, employing 109,309 persons earning \$73,491,000 and producing \$455,095,000 annually.

In connection with this exhibit it is expected that there will be carried on a most interesting series of public demonstrations—exhibitions for instance, of the research work carried out by the use of liquid hydrogen and illustrating the properties of matter at the temperatures approaching "absolute zero," should be of engrossing interest.

There is, according to scientists, a point at which heat is extinguished—where "the molecule ceases to vibrate." This theoretical point is called "absolute zero." It has been

scientifically stated to be at 460.6 degrees, Fahrenheit below zero. The lowest temperature recorded by Arctic explorers is 72 degrees below zero, though balloon-carried thermometers have registered as low as 100 degrees below zero by thermometers carried to a height of nine miles at which altitude the 100 degrees below zero weather prevailed.

Another series of experiments that is calculated to prove as interesting in a popular way as important scientifically will be the demonstrations devoted to the exposition of liquid air. These experiments, as prosecuted under the genius of Professor Dewar, have been reduced to the terms of popular understanding without rendering negative their scientific value.

The principle upon which Professor Dewar constructed his apparatus for liquid air production is elemental. Vapors and gases in a state of expansion absorb heat and reduce temperature. His successful experiments grew out of the extremes to which he carried this principle and the marvelous precision of the apparatus employed. The low temperature required for solidifying hydrogen was attained in three progressive stages. The liquefier was divided into three concentric and corresponding parts. The low temperature of the first stage became the high temperature of the second and the low temperature of the second became the high temperature of the third. Step by step the theoretical, critical temperature has been approached and gas after gas solidified, the element helium alone resisting all efforts to reduce it to a solid state.

The Federal government's interest in these experimental processes is sufficiently indicated by the fact that the United States has installed a complete "low temperature" plant in Washington and is proceeding with more important experiments. Germany is another nation deeply interested, and the more recent achievements in that country in the field of synthetic carbon chemistry being

largely responsible for the reputation popularly ascribed to Germany of being in the lead of all nations in individual chemistry—a belief intimately associated with Germany's recent brilliant achievements in her color industries.

It is probable that these experiments in what until recently was the world's greatest mystery—next to life itself—the mystery of heat, will be carried on at the forthcoming exposition under the light of the latest research and knowledge.

Theodore Hardee, chief of the department of Liberal Arts, says that there has been a more than gratifying response made to his invitations to participate, and that all nations will send their representatives and products to this most interesting department of human enterprise. From attar of roses brought from Bulgaria—the world's almost single source—in the Balkan mountains, to perfumes from Brazil, herbs from China and medicine chests from France, the American exhibitor is promised much friendly but vigorous competition to the importance of which he is, says Mr. Hardee, fully alive, his concern arising no less from impulses of patriotism than from motives of business and the opening of new trade routes and commercial centers due to the completion of the Panama Canal and the consequent opening up of the Orient and the rich nations on the western coast of South America.

ANNUAL MEETING OF THE AMERICAN DRUGGISTS' FIRE INSURANCE COMPANY.

The annual stockholders' and directors' meeting of the American Druggists' Fire Insurance Company was held on Tuesday and Wednesday, February 10-11.

The company is now saving its policyholders 25 per cent of their premium cost along absolutely safe and conservative lines, and if its growth in business continues, this saving can be extended to 30 per cent at a comparatively early time, and still greater opportunities along that line are sure to be realized with an increased volume of business. Every retail druggist in the country who places his insurance with the A. D. F. I. Co., thus adds to its ability to ultimately make greater savings in premium cost. The advantages for the retail drug trade of the country which

will accrue from the undivided support of the A. D. F. I. Co. are far reaching and the best which may be hoped for from every source considering as the first essential absolutely safe and reliable insurance.

The Board of Directors found the present office quarters of the company to be wholly inadequate for its needs in taking care of the growing business. It authorized the Executive Board to find either a suitable site for erecting an office building or an existing building which with alterations would be suitable for an office building, in such case providing therein for sufficient office space for the company's use and otherwise adapted for rental purposes as an investment, providing, however, that only the surplus of the company above capital and reserves should be available for such purpose. It is the aim of the Executive Board to carry this project out by finding a location where the company will not only have immediate and profitable return from such investment, but where the company will also derive benefit from the enhancement of ground value.

During the year the company wrote insurance amounting to \$12,569,310, at a premium of \$127,960.36. As compared with other companies this represents a premium value on business written of \$164,472.88. Of its business written during the year the company reinsured \$1,141,450, at a premium of \$13,158.06. On December 31 the company had 6,916 policyholders.

The direct net savings as made by the company for its policyholders during the year representing money actually retained by the policyholders, amounted to \$41,118.22. In addition the company made a net profit from its insurance business of \$20,323.96, and a net profit from the investment of its capital and surplus of \$11,846.36. Since the company has been in business it has saved its policyholders in their premium-cost the magnificent sum of \$158,033.36.

Assets and Liabilities, December 31, 1913.

Assets.	
Government, county and municipal bonds.....	\$323,417 27
Cash in bank and in office.....	9,914 72
Accrued interest on bonds and deposits	4,896 46
Office furniture, after deducting depreciation of 10 percent.....	659 45
Agents' balances in course of collection	15,368 31
Making a total of.....	\$354,256 21

Liabilities.

Agents' commissions, net.....	\$1,665 52
Salaries	833 48
State taxes on premiums, estimated income tax and personal property tax.....	2,334 22
Fire losses in course of adjustment	3,498 73
<hr/>	
Making total liabilities, not including re-insurance reserve, of.....	\$ 8,331 95

The above statement of assets and liabilities shows a gross surplus, including capital, of \$345,924.26. Under the insurance laws furniture and fixtures are not admitted as assets, and the reinsurance reserve on the business of the company, which amounts to \$57,697.83, must be shown as a liability, and after deducting these items from the gross surplus the absolute net surplus of the company, including capital, amounted to \$287,566.98.

During the year the company had fire losses amounting to \$37,170.22. Since it commenced business the total fire losses paid by the company amounted to \$143,579.91.

The entire directorate, consisting of Chas. H. Avery, L. G. Heinritz, James H. Beal, W. S. Elkin, Jr., Wm. C. Anderson, G. O. Young, A. O. Zwick, Lewis C. Hopp, Simon N. Jones, John D. Muir, Walter Rothwell, Geo. B. Kauffman, M. S. Kahn, E. B. Heimstreet and Frank H. Freericks, were re-elected.

In the election of Directors, Mr. Samuel C. Davis of Nashville had considerable support in securing the vote of nearly three thousand shares of stock.

The Board of Directors elected the following officers: Chas. H. Avery, President; L. G. Heinritz, Vice-President; Frank H. Freericks, Secretary and General Counsel; Geo. B. Kauffman, Treasurer; the Executive Board, Chas. H. Avery, L. G. Heinritz, Walter Rothwell, A. O. Zwick, J. H. Beal, Geo. B. Kauffman, and Frank H. Freericks.

On Tuesday, February 10, there was served to the stockholders of the company present at the meeting, a stockholders' luncheon at the New Gibson Hotel, and on that occasion all had an opportunity to profit from interesting talks by Dr. Wm. C. Anderson, who discussed the late Convention of the A. D. S., from Dr. James H. Beal, with reference to the progress of the Tampa Cuba Cigar Company, and from E. B. Heimstreet, regarding the National Druggists' Home at Palmyra.

On Tuesday evening the Directors of the company were entertained by the local stockholders who gave a theater party in their honor, the evening being closed with an after theater supper at the Bismarck.

WOMEN'S PHARMACEUTICAL ASSOCIATION.

The regular monthly meeting of the Women's Pharmaceutical Association of the Pacific Coast was held January 24, 1914, in the Assembly Hall, Pacific Building, San Francisco.

The Chairman of the Committee on Papers had prepared an elaborate program for the evening and many new points on the preparation of tincture of cudbear, prescription compounding and a serviceable label varnish were discussed. An interesting paper on Radium was presented by Dr. Barbat-Winslow, Miss Low read a paper on Emetine Hydrochloride, and Mrs. Kane presented a paper on Lloyd's Reagent. Mrs. White showed samples of Alcresta Tasteless Strychnine Tablets, Morphine and Berberine.

The following officers will serve the Association for the ensuing year: Mrs. R. R. White, President; Miss Clarissa Roehr, First Vice-President; Miss Ethel Nelson, Second Vice-President; Dr. J. E. B. Winslow, Secretary; Mrs. A. D. Kane, Treasurer.

The next meeting of the Association will be held in San Francisco, February 27, 1914.

operation of some medical interests and suggests a discussion on the ideal Pharmacopœia and Formulary from the physician's standpoint. One proposal has been that we present a symposium on the Pharmacopœias and Formularies of the world. This subject should undoubtedly be made a feature of the work of the Section, but it may be that with the large interest in the new editions of the U. S. P. and the N. F., our Section will be overcrowded this year with work connected with the new books.

It will be remembered that at Nashville, the retiring Chairman suggested that the Secretary compile as complete a list as possible of all pharmacopœias and formularies of the world. Mr. Raubenheimer at that meeting presented an interesting paper on formularies and showed a number of those which are used in this country and abroad. This list was afterwards carefully compiled with Mr. Raubenheimer's aid and will be published in the JOURNAL. A list of modern pharmacopœias will be found in the Digest of Comments of the U. S. P. and N. F. published by the Marine Hospital Service so that the Secretary can no doubt at the next meeting present lists which will cover the modern books in these two classes, thereby carrying out the recommendation of former Chairman Havenhill. When the Association secures its permanent buildings, a feature should undoubtedly be complete files of all modern pharmacopœias and formularies, and this list will be of assistance to the general Secretary when the time comes for purchasing such books.

It has been suggested that we discuss the scope of the two standard books, the U. S. Pharmacopœia and National Formulary. Upon mature thought, I doubt that the time has arrived when this can be discussed to any advantage. On the eve of publication of the new editions, we are not ready to plan too much detail for the next editions. Your Chairman would suggest that we bend our efforts more extensively to the *new books* for the coming year. A presentation of specimens showing all new formulas would be of interest. Papers outlining the changes in the new books in the various departments of the work would attract attention and be of value to the pharmacists and physicians of the country. The chemical side could be reviewed; that of doses and strengths, the

The Bulletin Board

To the Members of the Section on Pharmacopœias and Formularies:

The time has come when this Section should complete its plans for the meeting to be held at Detroit in August, 1914. Letter paper and envelopes have been sent to each member of the Section and the several members have acknowledged their receipt and expressed a willingness to co-operate in the plans.

Dr. Fantus promises to secure the co-

changes in pharmaceutical manipulation, etc., etc.

The time for each session is limited and we cannot read many papers at the meeting. We might solicit papers for criticism, although perhaps the time has not arrived for this. If we can make the meetings of the Section instructive and educational, this year's interests will be well served.

Comments are invited on these suggestions and all other recommendations will be submitted to the committee so that we can formulate plans of action.

Respectfully,

E. FULLERTON COOK, Chairman.

AN APPEAL TO THE WOMEN MEMBERS OF THE A. PH. A.

The Women's Section is desirous of getting in touch with the needs of women pharmacists and urges each member to submit either through the JOURNAL or to the Secretary of the Section any conditions surrounding their work which the Association might help to correct.

Women members are also asked to co-op-

erate in the work of the Women's Section by assisting the various committees and offering suggestions regarding present or new lines of work.

The Press Committee will advertise the A. Ph. A. to those whose interest should be secured. The Outlook Committee will seek new lines of endeavor for the Section and investigate all suggestions offered concerning conditions to be corrected. The duties of the Membership Committee are obvious.

While these committee appointments are limited by the Constitution and By-Laws to a few, that by no means limits the number expected to help on these committees. Rather the committee appointments are to be considered as perfunctory, as a bit of red tape necessary in any organization, but the real committees are limited only by the membership of the Section or Association.

The Committees of the Section will be found in the roster published in the January JOURNAL, and the officers of the Section will be glad to hear from all members at an early date, so that the Section may do its share to make the Detroit Convention a success.

ANNA G. BAGLEY, Secretary.

PHTHISIOPHOBIA..

Baldwin says that we are reasonably sure of the following: 1. Most adults have received some tuberculous infection. 2. From this they have acquired a variable degree of specific allergy. 3. During ordinary health the tissues repel tubercle bacilli, partly, at least, with the aid of this specific allergy. 4. Reinfection of adults is mostly a superinfection coming from the existing lesions, and due to disease, trauma, overstrain or any cause of "lowered vitality," whatever that may mean. 5. "Finally, as a corollary, adults are very little endangered by close contact with open tuberculosis, and not at all in ordinary association. Childhood is the time of infection, youth the time of superinfection, and that from extension of the primary disease. Qualify these statements as we may, it is time for a reaction against the extreme ideas of infection now prevailing. There has been too much read into popular literature by health boards and lectures that has no sound basis in facts, and it needs to be dropped out or revised. More protection of children and better hygiene for adults are logically demanded, but beyond this the preachments about the danger of infection to adults in the present state of society are without justification from an experimental standpoint." The statements which we have quoted represent not one man's views, but what seems to be the growing conviction of many of the most progressive and thoughtful students of tuberculosis at the present time.—*Journal Am. Med. Assoc.*

Editorial Notes and Announcements

JAMES H. BEAL, Editor.....Scio, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Postoffice the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished with not to exceed 50 reprints, without cover, of papers accepted for publication in the JOURNAL.

Larger numbers of reprints will be supplied by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

- 100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.
- 200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.
- 50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.
- 100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.
- 200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.
- 50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.
- 100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.
- 200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

MR. ERNEST C. MARSHALL UNITES WITH THE JOURNAL.

It affords the Editor the greatest of pleasure to be able to announce that Mr. Ernest C. Marshall, Ph. G., hitherto of Boston, Mass., but now of Columbus, Ohio, has united his fortunes with those of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, and with this issue assumes his duties as Advertising Manager and Associate Editor.

Mr. Marshall is a native of Boston, Mass., where he has passed his whole life. At the age of fourteen he entered the drug business under the tutelage of Benjamin F. Stacey, who for many years was an active and honored member of the A. Ph. A. He is a graduate of the Massachusetts College of Pharmacy, has held the offices of Trustee and Vice-President of that institution, and delivered the Commencement oration in 1885. He has also been President of the Alumni Association of the College. He first joined the American Pharmaceutical Association in 1875, but relinquished his membership therein during his temporary disassociation with the profession while engaged in the public service and with outside interests, but again connected himself with the Association on resuming connection with the profession. He was a member of the Boston City Council for two years, a member of its School Board for three years and has been Institutions Commissioner and Penal Institutions Commissioner of the County of Suffolk, of which the city of Boston is almost the whole. He has been prominent in Association work, having been President of the Massachusetts State Pharmaceutical Association, of which he is a life member, of the Boston Druggists' Association, the Suffolk Drug Co., and the Suffolk Drug Club. He is a Past Master in Masonry and is a Knight Templar. He has had experience in newspaper work and in advertising for more than ten years. He has been the New England representative of the Journal of the N. A. R. D. for the past three years and has written "The New England Letter" for the JOURNAL OF THE A. PH. A. He is a member of the Pilgrim Publicity Club, the leading organization of advertising men in New England.

Concerning Mr. Marshall's propaganda work in Boston, the Secretary of the Boston Retail Druggists' Association, Mr. C. H.

Davis writes the Journal of the N. A. R. D. as follows:

The loss of Mr. Marshall will be long felt by our association, yet we cannot help but congratulate Mr. Marshall on the position that he has accepted, and also the *Journal of the American Pharmaceutical Association* for obtaining so able an assistant. As superintendent of the propaganda department of our association, he has won for the betterment of pharmacy the good will and support of many, many physicians, reducing greatly the percentage of proprietaries prescribed, and paving the way for his successor. It was not an easy task to win the confidence of physicians for himself and those whom he was to benefit; to throw down pharmaceuticals and place in their stead those preparations that the physician, seemingly, had about forgotten ever existed. To be sure no little credit belongs to the pharmacist in our own ranks, who made and put up for him the samples for distribution. Yet who but Mr. Marshall could have won the day for us and given us the start?

Mr. Marshall's training and experience render him a valuable acquisition to the JOURNAL, and the Editor bespeaks for him the cordial and enthusiastic support of every member of the A. Ph. A. family.

THE HOSPITAL CORPS OF THE UNITED STATES ARMY.

An Urgent Appeal to Every Pharmacist in the United States.

The American Pharmaceutical Association, backed by the pharmacists of the whole United States, have a bill now before the House introduced by Representative Hughes of Georgia as Bill H. R. No. 1, and now before the Senate, introduced by Senator Bacon of Georgia as Senate Bill S. 929. These bills are identical and their text is as follows:

A BILL

To promote the efficiency of the Hospital Corps of the United States Army.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the Hospital Corps of the United States Army shall constitute the enlisted personnel of the Hospital Corps now authorized by law, and shall consist of thirty sergeants major at \$75 per month; three hundred sergeants, first class, at \$65 per month; sergeants at \$36 per month; corporals at \$24 per month; cooks at \$30 per month; privates, first class, at \$21 per month; and privates at \$16 per month, with such increase for length of service and other allowances as are or may hereafter be established by law.

As Chairman of the Committee on the Status of Pharmacists in the United States

Government Service of the National Association of Drug Clerks and also as a member of the American Pharmaceutical Association, we wish to urge every pharmacist who reads this article to sit down immediately and write a brief letter and then make copies of it and send a copy to each of the members of the Committee on Military Affairs of the House and Senate and urge that "you will please see that the bill H. R. No. 1 and S. 929 which have been fully endorsed by the surgeon-general of the U. S. army (as you will see in his last report) is offered as an amendment and placed as a "rider" on the army appropriation bill now before Congress."

The members of the hospital corps of the U. S. army are now so poorly paid that many are leaving the service, as the positions in the regular army service pay better salaries, even the men who take care of the sick mules are better paid than those who take care of the sick soldiers. Any one who is in a position to know will readily assure you of the difficulty of getting men in the hospital corps, and after getting them the difficulty of keeping them there on account of the miserably poor pay.

Pharmacists are men of influence in every section, their stores are all in the towns and cities and each one is a nucleus around which clusters the leading sentiments and views of the community. The pharmacists not only of your state, but of the whole United States, are deeply interested in the matter. Every state government requires the pharmacist who practices pharmacy among the people to be examined and licensed by a state board and to be an excellent type of man. With the present miserable salaries given the Army Hospital Corps, as just stated above, it is very difficult to get good men and still more difficult to keep them under present conditions. The Hospital Corps of your state troops are, of course, also in this same bad shape. Your help in this matter will be very much appreciated, as we feel that present conditions are unjust to those in the military service, to the public, to the medical officers of the army and to the profession of pharmacy, which all true pharmacists wish to see secure the recognition which it deserves.

GEORGE F. PAYNE.

(For further information concerning the Hughes-Bacon bill see JOURNAL for June, 1913, p. 669, and January, 1914, p. 13.—Editor.)

Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the editor on the day following the meeting, if possible. Minutes should be *plainly* written, or type-written, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

NASHVILLE BRANCH.

(January Social Meeting.)

One of the most enjoyable social meetings ever given by the Nashville Branch of the A. Ph. A. was the entertainment given Thursday night, January 22, in the parlors of the Y. M. C. A., which was attended by about sixty people besides the Tennessee Board of Pharmacy. Wm. R. White acted as master of ceremonies and in his introductory remarks compared the A. Ph. A. to a diamond with its many brilliant sides. The scientific, commercial, historical, practical and educational sides were all important he said, but the social side should not be neglected, and it was the object of these meetings to develop more sociability and good fellowship among the druggists and their families.

Dr. E. A. Ruddiman made a splendid address, recounting some of the pleasant happenings of the Nashville convention and telling something of the beauties and attractions of Detroit, the next convention city. He said the subject of shorter hours was one that he thought should be discussed. He felt sure the wives and families of the druggists would be as much interested as the druggists themselves.

Mr. F. W. Ward, of Memphis, President of the Tennessee Board of Pharmacy, delivered an eloquent oration which was filled with humor and pathos. He told of the splendid things accomplished by the Memphis Drug Club which sprung into existence as the result of the last State Association meeting.

He highly commended the idea of the Branch in giving these social meetings.

Mr. J. E. Justice, of Clarksville, the newly appointed member of the Board of Pharmacy, told some excellent anecdotes and expressed his gratification at being present.

The following musical and elocutionary program was then rendered: Vocal solo, Mrs. Baxter Moore; recitation, Miss Lucy Davis; vocal solo, Miss Mary Louise Sharp; recitation, Miss Dorothy Clark; piano selection, Mrs. Wm. R. White; recitation, Mr. H. P. Clark; instrumental selection, Miss Bessie Johnson.

W. R. WHITE, Sec'y.

NASHVILLE BRANCH.

(February Meeting.)

The regular meeting of the Nashville Branch of the A. Ph. A. was held at Furman Hall, February 12, with President J. O. Burge presiding.

The Entertainment Committee made a splendid report of the social meeting held at the Y. M. C. A., January 22, which was attended by over sixty people, including the members of the State Board of Pharmacy.

The committee appointed to present the claims and advantages of Nashville as a location for the A. Ph. A. Home made the following report, which will be sent to the Council for consideration:

WHEREAS, At the last annual meeting of the A. Ph. A., held in this city, the proposition to provide a permanent home for the Association was referred to the Council for further consideration; and,

WHEREAS, Efforts are now being made by other cities to secure the location of this permanent home,

Therefore, We, the members of the Nashville Branch, respectfully submit for the consideration of the Council the following reasons why the Home should be located in Nashville, Tenn.:

(1) Because Nashville offers a free site for the Home.

(2) It is about the center of population of the U. S. and within 24 hours' travel for the great majority of the pharmacists of the United States.

(3) The Climate is unexcelled for the proposed Botanical Gardens.

(4) It has the second largest facilities in the United States for printing.

(5) It is the greatest Educational center in the Central-Southern States and one of the greatest in the entire United States.

(6) It has progressive Pharmaceutical Schools for both races.

(7) It has a live growing Local A. Ph. A. Branch.

(8) It affords ample Hotel facilities for any future A. Ph. A. Conventions.

(9) It has low freight rates, proximity to needed supplies considered.

(10) Incorporated Bodies for Educational purposes on a non-profit basis, are not liable for taxation.

(11) It has been proven to have the cheapest cost of living of any city in the U. S.

Respectfully submitted,

W. R. WHITE,

S. C. DAVIS,

IRA B. CLARK,

Committee.

The subject of shorter hours was discussed at length and a state-wide movement is contemplated to interest the Pharmacists of the State in this subject.

The May meeting will be devoted entirely to this subject. W. R. WHITE, Secretary.

NEW YORK BRANCH.

(January Meeting.)

The January meeting of the New York Branch of the American Pharmaceutical Association was held on the evening of the twelfth. The meeting opened with President C. O. Bigelow in the chair. As Secretary Hugh Craig was absent, Frank L. McCartney was requested to act in his stead.

The minutes of the previous meeting were read and approved. The Treasurer's report was also read and approved.

Chairman Louis Berger, of the Membership Committee, announced a new member for the parent association and made reference to several prospective members.

Professor W. C. Anderson, Chairman of the Committee on Legislation, reported that there was little activity in legislative matters due to adjournment of Congress for the holiday season. He stated that such legislation as had been proposed effecting the pharmacist was receiving the necessary attention.

Due to the illness of Prof. G. C. Diekman, there was no report made by the Committee on the Progress of Pharmacy.

Dr. Diner, as Chairman of the Special Committee on the Madison Square Garden Drug and Chemical Exposition, stated it was the opinion of the committee that the New York Branch should not participate in the exposition, and by a majority vote it was decided that the New York Branch of the

American Pharmaceutical Association would not be officially represented. It was then pointed out that literature sent out by the promoters of the exposition indicated that the New York Branch would participate, and this resulted in a resolution being passed to the effect that such publicity was unauthorized, and the Secretary was instructed to so advise the promoters of the exposition in writing and demand that they recall and destroy such advertising matter and literature in which the name of the branch had been used, and at the same time the Secretary was instructed to communicate this information to the daily press.

Dr. Joseph Mayer, acting for the Nominating Committee, submitted the following names to be balloted on for election as officers for 1914:

For President—Dr. H. V. Arny.

For Vice-President—John Roemer.

For Secretary—F. L. McCartney.

For Treasurer—Dr. Joseph Weinstein.

For Committee Chairmen:

Education and Legislation—Dr. W. C. Anderson.

Progress of Pharmacy—Dr. G. C. Diekman.

Membership—J. H. Rehfuess.

Fraternal Relations—Louis Berger.

The committee's nominees were unanimously elected. The newly elected President was escorted to the chair, and after acknowledging the honor bestowed upon him he called for the speaker of the evening, Mrs. St. Claire M. Ransford-Gay, who read a paper on "The Pharmacopœia: Its Limitations."

Mrs. Gay expressed the opinion that the U. S. Pharmacopœia was behind the times and she attributed the decline in the professional side of the pharmacy to this fact. A great many of the drugs, chemicals and preparations of the Pharmacopœia were practically obsolete, stated the speaker, and indicated that the modern physician wanted elegant preparations which would appeal to the eye and taste, and manufacturing pharmacists recognized this fact. Mrs. Gay stated that a great deal of good would result to pharmacy if a central U. S. P. research laboratory were established. In pointing out what she considers pharmacopœial defects, Mrs. Gay asks why some elixirs were in the Pharmacopœia while others were to be found in the National Formulary; why the obsolete synthetic remedies are found in the Phar-

macopœia while those now most used are not given recognition. In conclusion, she stated that it was high time that the Pharmacopœia became modernized so that it would be used to educate physicians on new remedies.

A discussion followed, in which Messrs. Diner, Raubenheimer, Army, Mayer and Roemer took part.

Dr. Diner agreed with Mrs. Gay in that the Pharmacopœia was many years behind the times. He stated that many pharmacists regarded the U. S. P. as a sacred book, and added that if age is any criterion, then some of the formulas contained therein are indeed quite sacred. He indicated that the pharmaceutical press could do a lot towards keeping pharmacists abreast with new developments, but at the same time thought that their editorial pages were too often compelled to sing the tune of the advertising manager.

Otto Raubenheimer stated that he could not agree with the speaker in that the U. S. P. was behind the times, and asserted "we have the best Pharmacopœia in the world today, and I am proud of it. The next one will be better yet." He pointed out that many of the newer coal tar products were not official for the reason that process patents on them had not expired. He admitted that some reformation was needed in the U. S. P. and N. F.

Dr. Joseph Mayer suggested that the Revision Committee issue lists of items to be included in the U. S. P. more frequently in order that they might be published in the pharmaceutical journals. He indicated that quite recently a large batch of U. S. P. inclusions were issued at one time, and it was his opinion that this was done with the view to avoid publicity.

Dr. H. V. Army pointed out many of the obstacles with which the Revision Committee had to contend.

He was followed by John Roemer, who asserted that it was a vote and not a science which determined the inclusion of articles in the U. S. P. The Revision Committee rests on antiquated prejudices of 100 years ago in revising the U. S. P. He was of the impression that if the U. S. P. and N. F. were to act as a link between the physician and the pharmacist that these books must include some information useful to the physician. He indicated that the pharmacist also needed standards. He felt that the Pharmacopœia

should include single drugs and chemicals and the National Formulary should embody all preparations involving a pharmaceutical process.

The Branch placed itself on record as favoring this by adopting the following resolutions:

"That the U. S. Pharmacopœia include only single Drugs and Chemicals, with standards for such, and that the National Formulary embody all preparations involving a pharmaceutical process or processes."

Mrs. Gay was formally thanked by the Branch.

Upon Dr. Weinstein's motion, it was decided that the Branch hold a joint meeting with the New York County Medical Society at an early date, and suggested that Louis Berger, Chairman of the Committee on Fraternal Relations, should direct his efforts to bring this meeting about.

Former Secretary Hugh Craig telegraphed from Chicago, "All sorts of good wishes; I am with you in spirit."

FRANK L. MCCARTNEY, Secretary.

<>

CHICAGO BRANCH.

(January Meeting.)

The annual election of officers, reception of new members and social evening of the Chicago Branch of the American Pharmaceutical Association occurred Tuesday evening, January 20, at the University of Illinois School of Pharmacy building, Chicago.

The newly elected officers are as follows: President, J. H. Wells; First Vice-President, W. B. Day; Second Vice-President, Wm. Gray; Third Vice-President, Maurice Miner; Secretary-Treasurer, E. N. Gathercoal. Committee Chairmen: Practical Pharmacy, I. A. Becker; Medical Relations, Dr. Bernard Fantus; Publicity, L. E. Warren; Legislation, H. C. Christensen.

The Secretary-Treasurer reported receipts during the year of \$80, expenditures of \$67.61, and a cash balance of \$24.90. There were received 20 new members during the year. The total membership is 136, of which 86 are druggists, 17 members of pharmaceutical manufacturing houses, 14 teachers in pharmaceutical schools, four editors of pharmacy journals and the remainder chemists or engaged in allied industries.

An especial event of the evening was the welcome extended to new members. Secretary Thos. Potts introduced Mr. Hugh Craig,

recently installed Editor of the Journal of the National Association of Retail Druggists, and moved his election to membership in the Chicago branch. The motion was carried by acclamation. Professor Day introduced Mr. H. W. Colson, Mr. J. A. Dorjahn, Mrs. Mary Zwick, Mr. George Kraemer and Mr. A. E. Anderson as new members. They were each pleasantly received by the company. Mr. Wm. Gray was congratulated upon his recent election to life membership in the A. Ph. A. Mr. Potts, in introducing Mr. Craig, took occasion to speak of the great need among retail druggists for reliable formulas covering the great number of unofficial preparations and household remedies. He spoke of the proposed A. Ph. A. Book of Recipes and said that the A. Ph. A. was derelict in not having published such a work ten years ago. He mentioned the attempt now being made by the N. A. R. D. to remedy this pressing need of the druggist by furnishing to the retail drug trade not only practicable reliable formulas for a number of household articles, but also in supplying suitable labels in small quantities at a very low price to retail druggists for these preparations.

Mr. Craig expressed his pleasure in uniting with the Chicago Branch and assured us that he expected soon to be as much at home here as he had been for seven years in the New York Branch. During the seven years in New York he had not missed a Branch meeting and this, his first meeting with the Chicago Branch in January, followed within a month of the last branch meeting in New York, his record was still intact. Mr. Craig, referring to his experience as Associate Editor of the Druggists' Circular, spoke of the great number of formulas for every variety of preparation that could possibly be used in the drug business that he had originated, "borrowed" or "stolen." He dwelt upon the fact that unless a formula went into very great detail as to the materials to be used and the method to be followed in making a preparation, or unless the operator had an intuitive or acquired knowledge of methods, the product from the formula was usually a decided failure. In other words, the "personal equation" was the *q. s.* in all formulas, and unless a pharmacist had the "know how" in him the formula could but rarely put it in him.

Professor Day took occasion to review in a

few words some of the accomplishments of the Branch during the last seven years. He brought out the fact that when the Branch was organized in Chicago, the city already possessed one of the strongest and most active local druggists associations in the world, the C. R. D. A.; that the N. A. R. D. maintained its headquarters here, with all of their great activity, that the social side of things pharmaceutical was ably cared for by the Social Drug Club, now known as the Chicago Drug Club, and that our city possessed the most unique of all pharmaceutical organizations, the Chicago Veteran Druggists' Association, which especially attracted the older druggists. The Chicago Branch, therefore, upon its organization, chose as its special line of work the presentation and discussion of (1) legislative matters affecting pharmacists; (2) the revision of our national standards, the U. S. P. and N. F., and (3) original or improved unofficial formulas. Much good work along each of these lines has been accomplished. In addition, the Branch usually devoted one evening each season to a popular lecture and one evening to social events.

Under the able direction of Mrs. M. M. Gray and Miss Rose Schmid, refreshments were served and the meeting adjourned with many expressions of felicitations over "an evening well spent."

E. N. GATHERCOAL, Secretary.

CHICAGO BRANCH.

(February Meeting.)

Professor Joseph P. Remington honored the Chicago Branch of the American Pharmaceutical Association, Monday evening, February 16, with a visit and led the discussion of the evening, "Progress of Pharmacopoeial Revision." The meeting was very well attended. Many pharmacists, chemists, editors, teachers and students from the pharmaceutical schools of Chicago and vicinity, all friends and admirers of Professor Remington, were present.

Professor Remington brought out the fact that the revision of U. S. P. VIII is nearing completion and that U. S. P. IX will undoubtedly be in the hands of the publishers this year, possibly by July 1. He spoke of the large publicity being given to the work of revision and referred to the fact that

according to the wish of the 1910 convention, all changes in and additions to the text of the new pharmacopœia are to be published for comment and criticism before the matter goes to the printer. These changes and additions in the text of the chemicals has already been published (see J. A. Ph. A. for Dec., 1913), the copy of the text for the crude drugs has been sent to journals and will be published during March and April, and the material on the volatile oils and pharmaceuticals will immediately follow. The final date for the reception of criticisms by the Revision Committee will be announced with the last of the copy.

Professor Remington spoke of the inclusion of mercuric chloride tablets in the U. S. P. and the selection of the most desirable form for their administration. The subject is exceedingly important and suggestions are wanted. The definition of a "poison" has been put up to the Committee of Revision, and the professor humorously offered a prize of a five-dollar gold piece for a definition that would be acceptable to the committee. He discussed the admission to the Pharmacopœia of substances known as protected, proprietary or patented, and was inclined to oppose the admittance of such substances.

The address of Professor Remington was received with much applause. Then ensued a very interesting and profitable discussion of the address. Mr. Wilhelm Bodeman, member of the Committee of Revision, extended a welcome to Professor Remington.

Dr. Bernard Fantus, pharmacologist at the U. of I. Medical College, questioned the advisability of any tablet form, particularly a colored tablet, for dispensing bichloride, especially in view of the increasing use of candy medicaments in tablet or lozenge form.

Mr. Fred Meissner, of the U. S. P. Board of Trustees, believed that the present attention given to the dangers of bichloride tablets was largely due to newspaper notoriety and that if newspaper editors could be persuaded to omit the name of the poison in the published accounts of suicides, the danger of suicidal waves from particular poisons would be largely averted. In his extensive experience as a retail pharmacist he had never personally known of an accidental poisoning from bichloride.

Secretary Thos. Potts, of the N. A. R. D., spoke very strongly against the bichloride tablet, stating that the U. S. P. should not

recognize it and that this extreme poison should never be sold except on physicians' prescription, and then only in solution.

Secretary Light, of the C. R. D. A., said that the sale of bichloride tablets could be regulated in Chicago by city ordinance just as has been done in the case of phenol, cocaine, heroin, etc. He stated that recently a newspaper reporter came to him in regard to the sale and use of heroin in Chicago, and had been informed that members of the C. R. D. A. strictly adhered to the municipal code. Later the reporter attempted to buy heroin in twenty-seven drug stores located in different sections of the city, and in every case was refused the drug.

C. P. Van Schaack, of the wholesale trade, was warmly in favor of some regulation over the sale of bichloride.

Editor Hugh Craig, of the Journal of the N. A. R. D., endorsed the idea that corrosive mercuric chloride should be sold only on physicians' prescriptions. He referred to the suicidal cycles, lately phenol, now bichloride, next something else, each fostered by newspaper notoriety. He favored the addition to the U. S. P. of definite and important medicaments, even if patented.

Professor W. B. Day referred to Dr. Cohen's famous definition of a dose, "A dose is enough," and said then that a poison might be defined as "A poison is too much."

Dr. H. M. Gordin, member of the Revision Committee, humorously defined a poison as those substances listed by a suitable committee of learned gentlemen as such. Professor Remington refused him the prize.

Professor A. H. Clark, of the Revision Committee, said that the wide divergence of opinion as brought out in the discussion of the evening on one or two topics only illustrated some of the difficulties Professor Remington, as chairman of the committee, had to overcome in harmonizing on many subjects just as great differences of opinion in the committee. He was sure that U. S. P. IX, however, will rank, as does now U. S. P. VIII, the premier pharmacopœia of the world.

Professor George D. Timmons spoke of the U. S. P. doses, which Professor Remington had criticized as of no legal value, and held that average doses were of much value to teacher and student, pharmacist and even the physician.

Professor C. W. Patterson favored the

radical regulation of the sale of bichloride tablets and expressed, he was sure, the opinion of the entire audience, his pleasure in hearing the very interesting and instructive address and discussion of the evening.

Professor C. M. Snow spoke of the very complicated formula proposed for fluidextract of squill. Professor Remington thanked him for the criticism, and again asked for comments, favorable or unfavorable, on the text as now being published, stating that such comments would invariably receive the attention of the committee.

Secretary Gathercoal, of the Chicago Branch, announced the subject of the March meeting, "The Preparation of Diphtheria Antitoxin." Dr. H. M. Letton will lead with an illustrated lecture on the subject. All present, as well as others interested in this subject in Chicago and vicinity, were invited to attend the March meeting.

He moved a vote of thanks to Professor Remington for his very generous service to the Branch on this occasion. There was a unanimous response in a rising vote.

E. N. GATHERCOAL, Secretary.

NORTHWESTERN BRANCH.

(January Meeting.)

The January meeting of the Northwestern Branch of the American Pharmaceutical Association was held jointly with the Minneapolis Retail Druggists' Association and the Minneapolis Drug Club, in Odd Fellows' Hall, 703 Hennepin avenue, Minneapolis, on Thursday evening, January 22, at 8 p. m.

On account of the inability of President Gamble to arrive until later in the evening, Dr. Justin S. Brewer was asked to take the chair. The program consisted of the following symposium on Fungi:

1. "The Culture of the Edible Mushroom (*Agaricus Campestris*) as a Hobby for the Retail Pharmacist," illustrated with specimens grown by the speaker, Mr. A. J. Kline.
2. "Ergota and the Standardization of Ergot Preparations," demonstrated by the Cock's Comb Test, by Prof. H. C. Rogers.
3. "Fungus Plants and the Pharmacist," by Prof. E. L. Newcomb.

The papers presented were further illustrated with drug specimens, models of fungus plants, charts, lantern slides, etc.

Mr. Kline first gave descriptions of the more common forms of edible mushrooms and then proceeded in detail with the methods of soil preparation, culture and marketing

of the crop. The speaker illustrated his talk with beautiful specimens which he, as a busy retail pharmacist, had found great pleasure in growing. The paper, which appears elsewhere in this issue, was discussed by President Gamble, Dr. Brewer and others. Mr. J. D. Smeltzer called attention to the work of the Minnesota Mycological Society and stated that pharmacists who are interested in fungi would be welcomed at the meetings of that association. Mr. Smeltzer also suggested for those interested in the subject a visit to the Lambert caves in St. Paul and a perusal of the book entitled "Minnesota Mushrooms" by Prof. Frederick E. Clements.

In discussing Ergota, Prof. Rogers first gave a description of the life history of the plant yielding the drug, followed by a consideration of the different commercial varieties and their supposed relative value. Old and new methods for the preservation of the crude drug and its preparations were given and it was stated that experiments covering probably five years should be carried out before positive assertions can be made concerning the keeping qualities of ergot preparations under vacuum conditions. In discussing the constituents, attention was called to the unstable character of amines under certain conditions. The physiologic effect of ergot upon various animals such as pigs, horses, cattle, dogs and man were referred to. The different physiologic assay methods of ergot were explained and the method of applying the cock's-comb test was given in detail after which intra-muscular injections of U. S. P. fluidextracts of ergot were made on two white leghorn roosters. The arbitrary standard dose of 1.5 cc. per Kilo was given. Both samples were freshly prepared preparations, one being made from Spanish Ergot and the other from Russian. The results as indicated by the darkening of the comb, due to the rise in blood pressure, were pointed out by comparison with a third untreated rooster and these results were said to indicate that both preparations were of excellent quality. The preparations made from the Spanish Ergot gave slightly the better test. While waiting for the reactions to take place the speaker called attention to a tabulation which he had prepared of some fifteen tests carried out at the College of Pharmacy, University of Minnesota, showing the relative value of various commercial preparations and the deterioration due to age. The simplicity

of the manufacture of the fluidextract was also demonstrated. The retail pharmacist who uses considerable fluidextract of ergot was encouraged to make and standardize his own preparations from selected drugs and it was shown that by so doing the pharmacist not only can save money, but that he can accomplish something of greater importance by insuring the physician of a uniform active medicament and at the same time demonstrate his ability, all of which will tend to raise the doctor's estimation of the druggist as a professional man.

The symposium was closed by Prof. Newcomb, who spoke briefly on a number of fungus plants of interest to the pharmacist. These were illustrated by views thrown upon the screen by means of the projection lantern. Prof. Newcomb stated that the slides were loaned by the Department of Botany of the University of Minnesota and that many of them represented accurately colored photographs of rare specimens. Among the large number of fungi illustrated the following were dwelt upon at some length: *Peronospora*, *Aspergillus*, *Penicillium*, *Mucor*, *Claviceps*, *Ustilago*, *Agaricus*, *Amanita*, *Polyporus*, *Lycoperdon*, *Morchella*, *Coprinus* etc.

Following the several papers Mr. E. V. Clark gave a short talk on the value of active membership in such organizations as were represented by the joint meeting, laying special emphasis upon the lasting qualities of educational programs such as had just been presented.

After studying the various exhibits the meeting adjourned to meet in February with the Scientific Section of the Minnesota State Pharmaceutical Association.

E. L. NEWCOMB,

Secretary, N. W. Branch, A. Ph. A.

CINCINNATI BRANCH.

(January Meeting.)

The monthly meeting of the Cincinnati Branch A. Ph. A. was held at the Lloyd Library, January 13-14, with Prof. John Uri Lloyd as President of the meeting. The Secretary's report of the previous meeting was accepted and was favorably commented upon by the President. The exhaustive communication drafted by the Legislative Committee voicing the protest of the Branch to the enactment of the so-called Duffy act and

to other proposed laws was forwarded to Governor J. M. Cox, and a most courteous reply has been received by the Secretary. The President then introduced as the subject of discussion for the evening, "Mercury and Its Salts."

Mr. Charles A. Apmeyer, in stating the historical points of the subject, said in part, that the first records as to the use of mercury are found in Theophrastus, about 325 years before Christ. Its preparation is here given as from cinnabar by means of copper and vinegar and it was called Liquid Silver. The metal was known to the Egyptians, to India, and to China. The Arabs also were much interested in Mercury, as is shown by the works of Geber, in which the metal and its compounds, red precipitate and corrosive sublimate, are described. It was used much by the Arabians for skin diseases. Dioscorides describes the production of mercury from cinnabar. Pliny also makes mention of its preparation and described its purification by squeezing it through leather. It was known then that gold and other metals were altered by mercury. This knowledge is shown by processes described for assaying gold and silver. Paracelsus and his disciples had no hesitancy in making use of mercury sublimate and the so-called Turpeth Mineral. In this way a much better knowledge of the various mercurial compounds was gradually obtained until finally investigations and experiments led up to the discovery of calomel and white precipitate, both of which were hailed as great discoveries, were highly prized as medicines and still hold an important position among medicinal chemicals. It was during this period also that it was determined that cinnabar consisted of mercury and sulphur, and that mercury was a true metal.

We do not find mercury mentioned in the Book of Moses, or in the writings of the older Greek authors. Theophrastus (300 B. B.) speaks of liquid silver or quicksilver, and says it is obtained by rubbing cinnabar with vinegar in a copper vessel. Dioscorides, in the first century, mentions this body and states that it was obtained by subliming cinnabar and charcoal in an iron pot upon which a cover was luted. Pliny, who named the material thus obtained Hydrargyrum, in contradistinction to the native mercury to which he gave the name of *Argentum Vivum*, was acquainted with the fact that all solid bodies, with the exception of gold, float upon the

surface of the metal. Isidorus, in the beginning of the seventh century, was acquainted with the metal as is shown by the following extract: "Argentum vivum servitur melius in vitrius vasis nam caeteras materias perficit." Mercury was well known to the older alchemists for they believed it to be one of the component parts of all metals. Native mercury is occasionally met with in globules disseminated through the native sulphide, which is the ordinary ore. This is called cinnabar. It is found in many places in the world. From investigations of Becker and Schrauf the average per cent of metal found in cinnabar was 82.2%. Statistics show that California produced, in 1850, 7,723 lbs., and in 1908, 16,984 lbs. In 1906 the United States produced 26,238 lbs.,—in 1908, 19,752 lbs. In 1907 the average price per flask of 75 lbs. was \$38.43, and in 1908, \$41.72. The world's production of quicksilver in the years 1907-8 was:

	1907	1908
United States.....	734	672 flasks
Austria	610	630
Italy	680	423
Russia	130	49
Spain	1,210	1,065
Mexico	200	200

Mr. Apmeyer was followed by Dr. Dieckmeier, who spoke of the medical sides of the question. He said, "The physiological effects of all mercury salts and compounds are similar and vary only in degree according to the preparations used, with the exception of those salts of mercury in which that metal is combined with a substance having stronger toxic properties than mercury. All soluble mercury salts act on the skin and other surfaces as caustics and the insoluble salts do this as soon as they are converted by the body juices into soluble salts. Salts of mercury are of principal use for their antiseptic action, both internal and external. Mercury is principally a brain poison and in toxic cases few organs show definite pathological changes, the kidneys, bones, skin and mucus membranes being an exception.

Mercury is mostly eliminated by the intestinal tract, about 77% passing off through this channel, but all organs of the body will be found to contain some of the mercury ingested. Mercury injected into blood-vessels or sub-cutaneously is eliminated most quickly by the body, the effect of the poison administered in this way is more transitory. Mercury administered by mouth or inunction is

eliminated from the system, but very slowly, its presence in the system having been ascertained a year after its administration had been discontinued. The use of the bichloride as a surgical antiseptic should be discontinued on account of its caustic properties and because other equally important but less dangerous agents are available for use.

The discovery of the Wasserman test enables us to regulate the use of mercury preparations, so as to correct dosage, and to limit administration."

Dr. A. O. Zwick followed Dr. Dieckmeier, giving a short talk upon the destructive local effects of the bichloride of mercury, after which F. W. Wiessmann gave an interesting address upon "The Construction of Substitution Products," which was received by the members with much and earnest appreciation.

CHARLES A. APMEYER, Secretary.

CINCINNATI BRANCH.

(February Meeting.)

The regular meeting was held at Lloyd Library on February 10. President Lloyd being out of the city the duties of presiding fell upon Vice-President, Prof. Theo. D. Wetterstroem. The minutes of the last meeting were read and approved.

Prof. Theo. D. Wetterstroem read a paper on the subject of "Aspirin and Other Synthetics." He commented upon the products of different manufacturers, Hoffman, Van Heyden and others, calling particular attention to the fact of the trade name being perpetual, and described the physical and chemical properties, melting points, etc., of this synthetic drug. The discussion was participated in by Mr. L. Werner, Mr. C. G. Merrell and others.

Mr. Chas. G. Merrell took for his subject, "Sodium Salicylate." He presented the uses of same and illustrated the distinctive features between the products obtained from natural sources and that by artificial means. Notwithstanding the similarity of crystalline construction, he still prefers the sodium salicylate obtained from natural sources. He very entertainingly described his efforts in trying to secure the true herb in Pennsylvania and North Carolina, and said that most of the oil used was the Oil of Birch, which was indicated by a difference in the amount of Terpenes. Government distinguishing tests are not efficient as yet, but show im-

provement, based upon the presence or absence of Terpenes. Many other interesting points were brought out by this discussion, which were appreciated by the audience.

Miss Bertha Ott read a paper on the subject of "The Hospital Apothecary," describing the grand work accomplished, especially in hospital work in the missionary field.

Mr. Louis Werner took for his subject "Should sodium peroxide be used in the manufacture of H_2O_2 ?" He gave an exhaustive explanation of the various commercial methods of producing solution of peroxide hydrogen, giving the reasons for the production of cheap grades of this preparation, and stated, among other things, that one of the most important methods is that of burning metallic sodium in a stream of pure oxygen, or air free from nitrogen and carbon dioxide. This operation is best carried out in aluminum vessels and the gases must be thoroughly dried.

He described another commercial process conducted by burning slices of sodium resting upon trays of aluminum in a tubular vessel. In this it comes in contact with a current of air, which has been freed from carbon dioxide, and is maintained at a temperature between 300° to 400° . The oxide formed when thrown into water decomposes in part, in consequence of the heat developed, and gives sodium hydrate and oxygen. By careful cooling much of it can be dissolved. As metallic sodium, made by the electrolytic process is rather inexpensive, this forms a very desirable commercial method of manufacture.

Another process depends upon the ignition of sodium hydroxide, sodium oxide or sodium nitrate in an atmosphere of oxygen. This process is varied sometimes by dropping metallic sodium into fused sodium nitrate.

In order to make hydrogen peroxide from sodium peroxide, it is merely necessary to dissolve the sodium peroxide in ice cold water and neutralize with hydrochloric or sulphuric acid.

In making the solution of the peroxide, if the temperature is allowed to rise, the peroxide is decomposed by water, giving oxygen and sodium hydroxide.

In this process the peroxide solution is contaminated with sodium chloride. In order to avoid the presence of sodium salts, which would cause the non-volatile residue to exceed that allowed by the U. S. P., hydroflu-

silic acid is used, which forms an insoluble sodium salt.

Another method is first to treat an ice-cold solution of sodium peroxide with hydrofluoric acid. This solution is then treated with aluminum fluoride, which forms an insoluble double salt with the sodium fluoride.

Another method is to treat the ice-cold solution of sodium peroxide with dilute sulphuric acid, and then subject the mixture to fractional distillation, *in vacuo*. In this way the H_2O_2 is distilled off from the sodium sulphate and can later be diluted to the strength desired.

Mr. Werner's admirable paper was favorably commented upon.

Mr. Otto Katz, to whom had been assigned the subject "Dosage and Effects of Aconitine," said in part that DuRoi first obtained Aconitine in crystalline form in 1871, but Geiger and Hesse had applied the name Aconitine in 1833 to an amorphous base, obtained from the root of *Aconitum Napellus*.

After describing the physical and chemical properties of this most powerful drug, he passed to the dosage, giving the same as from 1/200 to 1/100 of a grain. He cites, however, a case where two grains have been given with no untoward effect, while 1/100 grain has caused death, which shows the uncertainty of dosage and the extreme care which must be employed in dispensing this powerful poison. He also calls attention to the local use of Aconitine, as in the form of oleate aconitine, and warned against the use of same, especially upon abraded surfaces. After moderate toxic doses the prominent symptoms are great disturbance of the respiration, muscular weakness, vascular depression and finally death, with or without convulsions. Given to a rabbit by injection of $\frac{1}{6}$ to a $\frac{1}{4}$ gr. the animal commences to jump vertically in a very peculiar manner. These movements grow less and less powerful and are finally replaced by severe convulsions, during which the animal lies prostrate on its side. In the dog, however, the muscles have remained without a quiver during all stages of the poisoning. The convulsions are an inconstant symptom, dependent upon the peculiarities of the individual or species, as well as the amount injected. Dilatation of the pupil very frequently occurs, if it be not indeed a constant phenomenon.

The symptoms, which are induced by small therapeutic doses of aconitine in man, are re-

duction of the force and frequency of the circulation, a sense of muscular inertia and weakness and a slight tingling in the extremities or in the hips.

If the dose administered be large, all these symptoms are, of course, intensified.

Mr. Katz treated his subject in a very exhaustive manner, and gained the thorough appreciation of his auditors.

A general discussion ensued regarding the various papers submitted during the evening, in which Mr. C. A. Apmeyer, Mr. Chas. G. Merrell, Mr. Louis Werner and others took part. CHAS. A. APMEYER, Secretary.

The Pharmacist and the Law

ABSTRACT OF JUDICIAL DECISIONS.

MISBRANDING—ADMINISTRATIVE REGULATIONS—DRUG DERIVATIVES. Certain packages of Antikamnia Tablets, Antikamnia and Codeine Tablets, and Antikamnia and Quinine Tablets were confiscated and condemned for alleged misbranding under the Federal Food and Drugs Act. The owner petitioned to be made a defendant in the libel, which was done, and the Court of Appeals of the District of Columbia affirmed a decree of the Supreme Court of the District, dismissing the libel. The United States Supreme Court has reversed this decision and remanded the cause with directions to overrule the exceptions to the libel. The labels on the packages bore the statement that the tablets contained no acetanilide, antifebrine, antipyrine, morphine, opium, codeine, heroin, cocaine, alpha or beta eucaine, arsenic, strychnine, chloroform, cannabis indica, or chloral hydrate, and stated the number of grains of acetphenetidin, which, the owners contended, was a sufficient compliance with section 8 of the Federal Food and Drugs Act. The ground of condemnation alleged was that the packages contained a large quantity and proportion of acetphenetidin, which, it was alleged, is a derivative of acetanilide, and that under the provisions of the act and of the regulations made thereunder, it was provided and required that the label on each package should bear a statement that the acetphene-

tidin contained therein is a derivative of acetanilide; which the labels on the packages did not do. It was also alleged that the packages were misbranded in that the labels thereon were false and misleading, for the reason that they bore the statement that no acetanilide is contained therein, and that the statement imports and signifies that there is no quality of any derivative of acetanilide contained in the drug. The owner's exceptions averred that the act does not provide that there should be added to any derivative of any of the substances contained therein the name of the parent substance, and the act cannot be added to or enlarged by requiring the company to add to the name of a known article, the fact that the article is a derivative of any of the substances mentioned in the act. It was also averred that the statement on the labels that no acetanilide was contained in the packages was not false and misleading, but true.

Food Inspection Decision No. 112, issued January 27, 1910, by the Department of Agriculture, quotes section 8 of the act, and states that the Attorney General, in an opinion rendered January 15, 1909, held that a rule or regulation requiring the name of the specified substance to follow that of the derivative would be in harmony with the general purpose of the act, and an appropriate method by which to give effect to its provisions. In conformity to this opinion, Regulation 28 of the Rules and Regulations for the Enforcement of the Food and Drugs Act was amended as follows: "Acetanilide (antifebrine, phenylacetamide). Derivatives—Acetphenetidine * * * (g). In declaring the quantity or proportion of any of the specified substances the names by which they are designated in the act shall be used, and in declaring the quantity or proportion of the derivatives of any of the specified substances, in addition to the trade name of the derivative, the name of the specified substance shall also be stated so as to indicate clearly that the product is a derivative of the particular specified substance."

Section 3 of the Federal Pure Food and Drugs Act gives the Secretary of the Treasury, the Secretary of Agriculture, and the Secretary of Commerce and Labor, power to "make uniform rules and regulations for carrying out the provisions of the act, and the power to collect specimens of food and drugs offered in interstate and foreign com-

merce." It adopts the definitions of the United States Pharmacopœia.

It was held that the power of the Secretaries is one of regulation only—not a power to alter or add to the act. If, therefore, the quantity or proportion of the substances or any derivative or preparation of them must be stated, is it administrative of the law or additive to it to require by regulation that not only the name of the derivative or preparation be stated, but from what substance derived or of which it is a preparation? It was held that the provision was one of regulation or administration only. Furthermore, it was held that the requirement of section 8 of the act means that the label shall also state the substance from which the derivative is produced, in order to make the warning of the labels complete.—*U. S. v. Antikamnia Chemical Co.*, 34 *Supreme Court*, 222.

ANTI-TRUST ACT—INTERSTATE COMMERCE IN MEDICINES.—In an action for a balance due and owing for medicines, extracts, etc., furnished by the plaintiff to the defendant on a written contract, the defense was that the contract was illegal and unenforceable because violative of the anti-trust laws of Texas. By the contract the plaintiff was to sell to the defendant, f. o. b. the cars at Winona, Minn., its medicines at the usual wholesale prices, less certain discounts, to be sold by him at the regular retail prices in a certain part of Texas, except in incorporated municipalities. The defendant agreed to sell no other goods except those purchased from the plaintiff while the contract remained in force, and only to customers at their residences in the prescribed district. It was held that the contract was violative of the Texas Anti-Trust Act of 1911, it clearly showing by its terms an intention to combine the capital, skill, and acts of the parties to fix and maintain a standard of prices upon a certain commodity and to prevent competition in a given territory. The sale was held to be interstate commerce, the sale of goods by a citizen in one state to a citizen in another state, the goods to be shipped from one to the other, being interstate commerce, even when the sale is made by an agent of the seller in the state of the buyer. But the fact that the sale constituted interstate commerce did not prevent the Anti-Trust Act from applying to invalidate the contract and prevent a recovery thereon. The fact that a part of the account was due

and stated at the time the contract was made and that the defendant expressly agreed to pay that sum did not save that part from being illegal and unenforceable; all items of the illegal contract being invalid.—*J. R. Watkins Medical Co. v. Johnson*, *Texas Civil Appeals*, 162 *S. W.*, 394.

ACTION AGAINST BOARD OF PHARMACY—ITS NATURE—PARTIES.—In an action of mandamus against the Kentucky Board of Pharmacy and its members to compel the issuance of a pharmacist's certificate of registration, permitting him to practice his profession in the state, the question was whether the action must be brought in the county in which the president of the board resides; the board having no office or place of business in any county. It was held that such an action is a transitory action governed by Kentucky Civ. Code Prac., §78, requiring actions whose venue is not established by other sections of the article to be brought in the county where the defendant, or any one of several defendants, resides or is summoned, and may be brought in any county where process is executed upon the members of the board or any one or more of them. The board, not being designated a corporation by the act organizing it, is not a "corporation," and, while it is a "quasi corporation," when acting pursuant to contractual powers conferred by the act creating it, is not governed by Civ. Code Prac., §72, requiring an action of contract against a corporation having an office or place of business in a county or an agent residing therein to be brought in such county or in the county in which the contract is made or to be performed, and that an action of tort be brought in such county or the county in which it is committed. The action being to compel the performance of a ministerial duty, the members must be sued by name in order that the court may determine whether they are the proper persons to perform such duty, and in order that it may command them to perform it.—*King v. Kentucky Board of Pharmacy*, *Kentucky Court of Appeals*, 162 *S. W.*, 561.

OCCUPATION TAX ON TRAVELING VENDORS OF PATENT MEDICINES.—In proceedings for unlawfully following the occupation of a traveling retail peddler of patent medicines without being licensed and paying the tax required by law, the chief defense was that druggists selling patent and other medicines

at their regular places of business were not required to pay any tax. It was held that Texas Const., Art. 8, §§ 1, 2, authorizing the imposition of occupation taxes, which must be equal and uniform on the same class, empowers the Legislature to establish such classes, and Rev. Civ. St. 1911, arts. 7355, 7357, imposing an occupation tax on traveling vendors of patent medicines, is not invalid because exempting merchants and druggists selling patent medicines, for the classification is reasonable. Penal Code 1911, arts. 3, 6, provides that no person shall be punished for any act unless the same is made a penal offense and a penalty affixed by written law, and that the articles in the Penal Code and other written law may be looked to. Article 130 of the Code makes one pursuing a taxable occupation, without first obtaining a license, liable to a fine not less than the tax due. It is held that under these articles, read in connection with arts. 7355, 7357 of Rev. Civ. St., imposing an occupation tax of \$100 on traveling vendors of patent medicines, and providing that the commissioners' court may levy for county revenue purposes, one-half of the state occupation tax on all occupations, prescribes a penal offense for pursuing the business of peddling patent medicines without first paying the occupation tax imposed by the statute and by the commissioners' court. The statutory provisions were held not to be void on the ground that the penalty in part may be fixed by the commissioners' court, levying a tax of one-half of that of the state for the county.—*South v. State, Texas Criminal Appeals*, 162 S. W., 510.

AGENTS' AUTHORITY TO PURCHASE DRUGS—EVIDENCE.—Action was brought for the price of 250 dozen of a patent or proprietary medicine, sold and delivered to an agent of a branch house of the defendant company, which was engaged in a mercantile business. The issue was whether the agent had authority to order the drugs and bind the company for the price. It was held that evidence that the purchase involved was such a large one that it was out of the ordinary line of business of an agent of the character of the one acting for the defendant was properly excluded, in the absence of evidence bringing home to the plaintiff knowledge of the custom, especially where the defendant's vice-president had stated that the agent had

authority to make the purchase in question.—*Patton-Worsham Drug Co. v. Goddard Grocery Co. (Mo.)*, 162 S. W., 288.

NORTH DAKOTA "ANTI-SNUFF ACT" HELD CONSTITUTIONAL.—Chapter 271 of North Dakota Laws of 1913 makes it unlawful "for any person, firm or corporation to import, manufacture, distribute, * * * or give away any snuff or substitute therefor, under whatever name called, and as defined in this act." The act defines snuff as "any tobacco that has been fermented, or dried, or flavored, or pulverized, or cut, or scented, or otherwise treated, or any substitute therefor or imitation thereof, intended to be taken by the mouth or nose. Provided, however, that ordinary plug, fine-cut, or long-cut chewing tobacco as now commonly known to the trade of this state, shall not be included in this definition." It is held that the statute is constitutional and cannot be assailed upon the ground that it deprives any person of life, liberty, or property without due process of law, or denies to any person the equal protection of the laws. In commenting upon the necessity for the statute, the court held that it could take judicial notice of the fact that the use of tobacco by the young was injurious, and that the school boy could secretly use tobacco in the form of snuff, when he would be liable to be detected in any other form of use. It could also take judicial notice of the general fear in the community that drugs and opium are, and can be, more easily mingled with snuff and be less readily detected than in other forms of tobacco.—*State v. Olson, North Dakota Supreme Court*, 144 N. W., 661.

ABSTRACT OF TREASURY DECISIONS.

CHEMICALS — MEDICINAL COMPOUNDS — ARTICLES IN PACKAGES OF 2½ POUNDS OR LESS.—All articles provided for in the dutiable schedule of the tariff act of 1913 which in fact consist of chemical or medicinal compounds, or combinations, or articles similar thereto, in packages of 2½ pounds or less, are dutiable at not less than 20 percent ad valorem under paragraph 17. This provision is a new one, and, in the opinion of the department, not only all the articles in Schedule A except soap and sponges, but all

articles elsewhere provided for in the act which in fact consist of chemical or medicinal compounds or combinations or articles similar thereto, are also subject to such minimum rate of duty when put up in such packages.—(T. D. 34035.)

DRAWBACKS ON MEDICINAL PREPARATIONS.—Drawbacks have been allowed on the following medicinal preparations:

Tobias Liniment, manufactured by O. H. Jadwin & Sons (Inc.), New York, N. Y., with the use of domestic tax-paid alcohol.—(T. D. 34068).

Medicinal and toilet preparations and flavoring extracts manufactured by Dr. Ward's Medical Co., of Winona, Minn., with the use of domestic tax-paid alcohol.—(T. D. 34071).

Flavoring extracts manufactured by Richard Frank & Co., of New York, N. Y., with the use of domestic tax-paid alcohol.—(T. D. 34082).

Flavoring extracts manufactured by the Liquid Carbonic Co., of Chicago, Ill., with the use of domestic tax-paid alcohol and imported ethers, essential oils, roots, herbs, vegetable coloring matter, and acids.—(T. D. 34109).

T. D. 34071 (abstracted above) is extended to cover flavoring extracts manufactured by Jacob House & Sons, of Buffalo, N. Y., with the use of domestic tax-paid alcohol.—(T. D. 34149).

ALCOHOLIC PERFUMERY.—The merchandise known as "Lanza" perfume was assessed with duty at the rate of 60 cents per pound and 50 percent ad valorem as an alcoholic perfume under paragraph 67 of the tariff act of August 5, 1909. It was held by the Board of General Appraisers to be properly dutiable, as claimed by the importers in their protest, at the rate of 30 percent ad valorem as ethyl chloride under paragraph 21 of the said act. In view of the importance of the issue, the Treasury Department has directed appeal to be taken from this decision.—(T. D. 34058).

IMPORTATION OF VIRUSES, SERUMS, ETC.—LIST OF LICENSED MANUFACTURING ESTABLISHMENTS.—A list of the establishments, fifty in number, holding, on January 1, 1914, licenses under the act of 1902 for the regula-

tion of the sale of viruses, serums, toxins, and analogous products in the District of Columbia, is issued by the Treasury Department, with the names of the several products for which licenses have been given.—(T. D. 34060).

DRUMS — RE-IMPORTATION — GLYCERIN — CHEMICAL.—Free importation is authorized upon re-importation of drums used for the shipment of glycerin under paragraph 406, tariff act of 1913.

The Bureau of Chemistry states that from a commercial point of view a chemical may be defined as "any substance or mixture of substances of fairly definite composition obtained by chemical process used in the arts for its chemical effect either by itself or in the manufacture of other substances." (T. D. 34,113.)

MIXED FISH OIL—COD OIL.—Only oil which is the product of unhealthy and putrid livers of codfish and allied species, whether or not containing the entrails and other refuse parts of the fish thrown in and allowed to undergo putrefaction, is entitled to admission free of duty under paragraph 561 of the tariff act as cod oil.—(T. D. 34160.)

RADIOGEN-TRINKWASSER—RADIUM BROMIDE IN WATER.—Radium bromide dissolved in distilled water is entitled to free entry as "radium" under paragraph 659 of the free list, and is not properly dutiable at 25 percent ad valorem as a medicinal preparation not specially provided for under paragraph 65, act of 1909.—(T. D. 34052.)

ALCOHOLIC COMPOUND—CHEMICAL MIXTURE CONTAINING ALCOHOL.—To constitute a chemical mixture containing alcohol under paragraph 3, act of 1909, the chemicals themselves must form such a substantial part, without the alcohol, as to give such predominant character to the article taken as a whole.

2. If the alcohol largely predominates, and the other ingredients of a chemical nature become relatively insignificant in quantity and proportion, then the article is an alcoholic compound under paragraph 2.

3. Linalco Seele, manufactured as a base for non-alcoholic drinks, is an alcoholic compound.—*U. S. v. Kraemer* (4 Ct. Court Appls., 433; T. D. 33858) followed. (T. D. 34124—G. A. 7527.)

Council Business

COUNCIL LETTER No. 11.

PHILADELPHIA, PA., Jan. 31, 1914.

To the Members of the Council:

Motions No. 19 (Publication of Tentative Program for the 62d Annual Meeting), No. 20 (Election of Members; Applications Nos. 25 to 33 inclusive), and No. 21 (Approval of Report of Committee on Publication), have each received a majority of affirmative votes.

Motion No. 22 (Appropriation of \$100 for Committee on Status of Pharmacists in the Government Service). Moved by J. H. Beal, seconded by J. A. Koch, that the sum of one hundred (\$100.00) dollars, or so much thereof as may be necessary, be appropriated for the use of the Committee on Status of Pharmacists in the Government Service. This appropriation has been approved by the Committee on Finance.

Motion No. 23 (Appropriation of \$250 for Expenses of Delegates to National Drug Trade Conference for 1914). Moved by J. H. Beal, seconded by J. A. Koch, that the sum of two hundred and fifty (\$250.00) dollars, or so much thereof as may be necessary, be appropriated for payment of the expenses of delegates to the National Drug Trade Conference during the year 1914. This appropriation has been approved by the Committee on Finance.

Motion No. 24 (Election of Members). You are requested to vote on the following applications for membership:

No. 34. Henry W. Dreyfus, 4806 West End Ave., Chicago, Ill., rec. by J. H. Wells and H. M. Whelpley.

No. 35. George Waller Harrison, Railway Ave., Cypress River, Manitoba, rec. by F. E. J. Bletcher and Evelyn Nesbitt.

No. 36. Gustave Horstmann, 14 Mount Vernon Ave., Mount Vernon, N. Y., rec. by Jacob Diner and Caswell A. Mayo.

No. 37. Leopold H. Fried, 1477 Washington Ave., Bronx, New York, N. Y., rec. by A. P. Lohness and Wm. C. Anderson.

No. 38. Louis Cramer, 72 Clinton St., Saratoga Springs, N. Y., rec. by J. H. Beal and J. W. England.

No. 39. Phillip LeVert Gregory, 200 Maine St., Johnson City, Tenn., rec. by Frank S. Brown and George M. Beringer.

No. 40. Pierre Arnold Bernard, 258 W. 74th St., New York, N. Y., rec. by J. W. England and W. B. Day.

No. 41. Clyde I. Killingsworth, 32 Adams Ave., W., Detroit, Mich., rec. by Leonard A. Seltzer and A. H. Wheeler.

No. 42. Charles A. Billups, Jefferson Barracks, Missouri, rec. by E. R. Miller and H. M. Whelpley.

No. 43. Frank J. Butler, 123 N. Mell St., Pontiac, Ill., rec. by W. B. Day and A. H. Clark.

No. 44. Charles Weissmann, 2332 Highland Ave., Cincinnati, Ohio, rec. by Chas. Ehlers and Chas. A. Apmeyer.

No. 45. Walter Gordon Leacock, 2210 Gratiot St., Detroit, Mich., rec. by Wm. A. Hall and Leonard A. Seltzer.

No. 46. Constantine Diamanti Lemos, Rue Trassa, Smyrna, Asia Minor, rec. by James A. Patch and T. C. Ladakis.

No. 47. Peter S. Houston, 46 Warner St., Dorchester, Mass., rec. by Anna G. Bagley and John G. Godding.

No. 48. Frank Hamilton Shurtleff, 278 Dartmouth St., Boston, Mass., rec. by Anna G. Bagley and John G. Godding.

No. 49. Mrs. Mary Hall Zwick, 511 South Humphrey Ave., Oak Park, Ill., rec. by Mrs. M. M. Gray and W. B. Day.

No. 50. James D. Howard, Etowah, Tenn., rec. by Ira B. Clark and William R. White.

No. 51. Joseph L. Turner, care Bristol-Myers Co., 281 Greene Ave., Brooklyn, N. Y., rec. by Otto Raubenheimer and E. L. Maines.

No. 52. Clifton Henry Briggs, care Parke, Davis & Co., Detroit, Mich., rec. by Wilbur L. Scoville and H. C. Hamilton.

No. 53. Frank Merrell Best, 120 N. 3d St., Lafayette, Ind., rec. by C. B. Jordan and A. H. Dewey.

No. 54. Lea Ludwig Mrazek, 1500 West 18th St., Chicago, Ill., rec. by W. B. Day and E. N. Gathercoal.

J. W. ENGLAND,
Secretary of the Council.

COUNCIL LETTER No. 12.

PHILADELPHIA, PA., February 19, 1914.

To the Members of the Council:

Motions No. 22 (Appropriation of \$100 for Committee on Status of Pharmacists in the Government Service), No. 23 (Appropriation of \$250 for Expenses of Delegates to National Drug Trade Conference for 1914), and No. 24 (Election of Members; Applications Nos. 34 to 54, inclusive) have each received a majority of affirmative votes.

The following communication has been received:

CAMDEN, N. J., February 17, 1914.

Mr. Joseph W. England, Secretary, Council of the American Pharmaceutical Association, Philadelphia, Pa.:

My Dear Mr. England—The protection of the public by the throwing of every possible

safeguard around the sale of bichloride of mercury tablets is rightly receiving the earnest consideration of thoughtful and progressive pharmacists. THE JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION has presented to its readers a number of timely articles and suggestions on this subject, and the most recent issue contains an editorial resume of proposed national bichloride legislation.

It is eminently proper that pharmacists should themselves solve some of the problems associated with this question of public safety. There are a number of important points associated therewith on which their judgment should be exercised in properly shaping legislation. Foremost among these is the question of the selection of a proper shape or form for bichloride of mercury tablets not intended for the administration of an internal medicinal dose; what are commonly known as antiseptic tablets.

It is certain that we may soon expect some authoritative statement, either legislative or pharmacopœial, that will designate the form or shape of such bichloride antiseptic tablets. The round disc shaped tablet that has heretofore been commonly used is too dangerous to be continued, because this shape has been almost universally used for all forms of medication as well as for confectionery and food products. There is nothing distinctive about such a shape, and its use should be discontinued for such toxic units as a bichloride antiseptic tablet. Various other shapes, such as triangular, diamond shape, clover leaf shape, pipe or cylindrical shape, cubical shape, have been proposed and advocated even to the extent of incorporating some of these in proposed legislation. The latter shape (cubical), although proposed in several of the bills now before Congress, is particularly objectionable because this form has been used for the exhibition of confectionery and many food products, and likewise for non-poisonous medicines.

The form adopted should be distinctive, so that it could not be possible to mistake it for any other form of medication or any food or confection. Of all the forms so far proposed, the one which appears to best meet this requirement is the coffin shape or casket shape tablet as originally proposed by Mr. Franklin M. Apple in a paper presented to the Pennsylvania Pharmaceutical Association meeting in 1913. This shape is so distinctive, and if the design is further embellished with the "skull and cross bones" and the word "poison," as proposed by Mr. Apple, it could not be mistaken for any other tablet. I am strongly in favor of adopting this shape exclusively for poison tablets intended for external use. Such shape should be adopted by the Pharmacopœia and protected by Congressional and State enactments.

Further, the use of this design for any other purpose than for the preparation of poison tablets for external use, *should be prohibited by such legal enactments.* This will prevent foolish imitations which would de-

stroy the entire value and purpose of such a design.

The suggestion of Mr. Apple has been adopted on a commercial scale by the Norwich Pharmacal Company, who have likewise applied for a patent on this design and its use for poison tablets. Several interviews have been held between officers of this pharmaceutical manufacturing house and your President and Vice-President Apple, and they have very generously offered to assign to the American Pharmaceutical Association all their right, title and interest in this patent so that this form could be adopted by the Pharmacopœia, and under proper protection and free from monopoly by any one manufacturing house. They guarantee to prosecute the application for a patent and its assignment to the American Pharmaceutical Association without any expense to the Association.

It is my pleasure to transmit herewith their communication fully covering this proposition. I ask that these entire communications be promptly submitted to the Council for action.

It is a very opportune proposition by which the American Pharmaceutical Association can demonstrate its active interest in protecting the public in the dispensing of potent medicines. I recommend its prompt acceptance with an appropriate acknowledgment of the humanitarian spirit and the generous action of the Norwich Pharmacal Company in this matter. I am

Yours respectfully,

(Signed) GEORGE M. BERINGER,
President American Pharmaceutical Association."

THE NORWICH PHARMACAL COMPANY.

NORWICH, N. Y., February 16, 1914.

George M. Beringer, Ph. M., President American Pharmaceutical Association:

Dear Mr. Beringer—Confirming our recent conversation, we hereby freely tender to the American Pharmaceutical Association, for the public good, all rights and interests in our invention of a coffin-shaped antiseptic tablet, having embossed on one side the word "Poison" and on the reverse the emblem of a skull and cross-bones. This we propose to make effective by assignment to your Association of all our right, title and interest in the pending application for design patent, Serial No. 801,748, and we hereby agree to bear all expense incident to the prosecution and securing of said patent.

It also gives us much pleasure to advise you that Mr. Franklin M. Apple, of Philadelphia, Pa., joins with us in placing in the hands of your Association this unique means of safeguarding the use of poisons, which idea first received general publicity in the pharmaceutical press through the able and timely paper read by him before the Pennsylvania Pharmaceutical Association in June, 1913.

We are led to voluntarily relinquish our

rights to this invention because we believe that the humanitarian purpose of safeguarding human life against accidental poisoning demands that there should be one form which will be universally recognized as distinguishing the virulent poison. This the coffin-shaped tablet will do. It has never before been used either for compressed tablets, confectionery or like purposes; its surfaces are rough to the touch and its appearance is so suggestive and forbidding that no wrapping in paper is necessary to declare its dangerous character.

With the control of the invention in the hands of a national association representing your splendid profession, and safe from monopolistic use by any manufacturer, it may properly be included in the pharmacopœial requirements for antiseptic tablets. We believe further that under these circumstances, uniform national and state legislation should be urged by all the drug interests to make illegal the use of this form or design for any other purpose than the exhibition of bichloride or like potent poisons.

Our assignment to your Association carries no conditions except that we reserve to ourselves the right of manufacturing these tablets, to be enjoyed in common with all other manufacturers under such regulations as your Association may adopt to fully protect your rights under the U. S. Patent laws.

We enclose herewith a copy of the assignment which we are ready to execute and also a copy of letter from our attorneys, which explains and confirms our purpose to protect your Association from all possible expense or litigation in connection with this matter. This assignment might be deferred until the patent has been granted or the subject fully disposed of, except for the fact that prompt action seems imperative to forestall hasty and ill-advised legislation, lacking uniformity and possibly requiring various forms which might add to existing dangers through their similarity to form at present in use for tablets internally administered or for confectionery.

We are sure that prompt action may be taken by your Council, as we believe no firm or corporation would place any obstacles in the way of granting a patent upon this particular design, in view of the laudable purpose for which it is to be used, as understood by yourself and Mr. Apple and in furtherance of the broad humanitarian purposes of your Association.

Sincerely yours,

THE NORWICH PHARMACAL COMPANY,
(Signed) R. C. STOFER,
President."

"VICTOR J. EVANS & CO.,

Victor Building, 724-726 9th St. Northwest,
WASHINGTON, D. C., February 13, 1914.
The Norwich Pharmacal Co., Norwich, N. Y.:
Gentlemen—Enclosed please find form of
assignment of your application for Design
Patent, Serial No. 801,748.

In reply to your inquiry, it is quite permissible to assign applications for patents, and, in fact, it is the ordinary procedure, excepting that your purpose is of a very unusual character.

We fully understand your instructions, namely, the above design patent is to be prosecuted and obtained at your expense; all bills for our services will, therefore, be rendered to you as usual.

Yours very truly,
(Signed) VICTOR J. EVANS & Co."

"ASSIGNMENT.

Whereas, William P. McNulty, a citizen of the United States, residing at Norwich, in the County of Chanango and State of New York, has invented a new, original, and ornamental design for a Poison Tablet, for which he filed an application for design patent of the United States, on the 18th day of November, 113, Serial No. 801,748; and

Whereas, The Norwich Pharmacal Company, Inc., duly incorporated under the laws of the State of New York, and doing business at Norwich, in the County of Chanango and State of New York, has acquired the entire interest in said invention and in and to the Letters-Patent of the United States to be obtained therefor; and

Whereas, The American Pharmaceutical Association, Inc., duly incorporated under the laws of the State of and doing business at, in the County of and State of, is desirous of acquiring an interest in said invention and in and to the Letters-Patent of the United States to be obtained therefor;

Now, therefore, Be it known that for and in consideration of the sum of one dollar, to us in hand paid, the receipt of which is hereby acknowledged, and other valuable consideration, the said The Norwich Pharmacal Company, have sold, assigned and set over, and do by these presents hereby sell, assign and set over unto the said American Pharmaceutical Association, Inc., its successors and assigns, the entire right, title and interest in and to the said design and in to the Letters-Patent of the United States which may be granted therefor; and we do hereby authorize and request the Commissioner of Patents to issue the said Letters-Patent to the said American Pharmaceutical Association, Inc., in accordance with this assignment.

In Testimony Whereof, we have hereunto set our hand and affixed our seal this day of, 1914.

.....
President.

Witness:

.....

J. W. ENGLAND,
Secretary of the Council.

415 North Thirty-third Street.

UNITED STATES PUBLIC HEALTH SERVICE.

PROMOTIONS.

Passed Assistant Surgeons John M. Holt, Robert L. Wilson and John T. Burkhalter, promoted and commissioned as Surgeons, effective Dec. 1, 1913. Feb. 3, 1914.

BOARDS CONVENED.

Board of medical officers convened to meet at Detroit, Mich., for the re-examination of alien John A. Peterson. Detail for the board: Senior Surgeon H. W. Austin, chairman; Assistant Surgeon Joseph Bolten, member; Acting Assistant Surgeon K. L. Weber, recorder.

Board of commissioned medical officers convened to meet at the U. S. Marine Hospital, Stapleton, N. Y., Monday, Feb. 23, 1914, for the purpose of making the physical examination and conducting the mental examination of Assistant Surgeon Carlisle P. Knight to determine his fitness for promotion to the grade of Passed Assistant Surgeon. Detail for the board: Senior Surgeon G. W. Stoner, chairman; Passed Assistant Surgeon W. M. Bryan, recorder. Jan. 16, 1914.

(List of changes of stations and duties of commissioned and other officers of the United States Public Health Service):

Irwin, Fairfax, Senior Surgeon. Authorized to proceed to Marcus Hook, Pa., when necessary for inspection and supervision of quarantine operations. Jan. 19, 1914.

Lavinder, C. H., Surgeon. Detailed for temporary duty at Hygienic Laboratory, effective Jan. 12, 1914. Jan. 12, 1914.

Foster, M. H., Surgeon. Directed to proceed to Saratoga Springs, N. Y., for the purpose of making an examination of an alien to observe the results of the grattage operation for the cure of trachoma. Jan. 19, 1914.

Schereschewsky, J. W., Surgeon. Directed to proceed to Chicago, Ill., to attend meeting of National Council of Safety, Jan. 20, 1914. Jan. 16, 1914.

Ramus, Carl, Surgeon. Granted 5 days' leave of absence on account of sickness from December 12, 1913. Jan. 19, 1914.

Currie, Donald H., Surgeon. Granted 4 months' leave of absence, with pay, from Dec. 20, 1913, and eight months' leave of absence, without pay, from Apr. 20, 1914, for

service as secretary of the State Board of Health of California. Jan. 16, 1914.

Long, J. D., Surgeon. Directed to assume charge of Service Laboratory in addition to his duties in plague suppressive measures in California. Dec. 18, 1913.

Pierce, C. C., Surgeon. Detailed for temporary duty at Hygienic Laboratory, effective Jan. 12, 1914. Jan. 12, 1914.

Creel, R. H., Passed Assistant Surgeon. Directed to proceed to Gulfport, Miss., and vicinity, in company with an inspector from the Bureau of Chemistry, Department of Agriculture, for the purpose of making a sanitary survey of the conditions under which oysters are grown and handled for shipment. Jan. 17, 1914.

Phelps, E. B., Professor of Chemistry. Directed to proceed from New York, N. Y., to Boston, Mass., for the purpose of supervising the investigations of sanitary administration now being conducted in Massachusetts. Jan. 19, 1914.

Brown, F. L., Pharmacist. Directed to proceed with four attendants to the Delaware Breakwater quarantine station to assist in handling personnel of steamer detained on account of smallpox. Jan. 14, 1914.

Berkowitz, M. F., Pharmacist. Relieved from duty at Philadelphia, Pa., and directed to proceed to Cairo, Ill., and report to the medical officer in charge for duty and assignment to quarters.

Gray, Ralph E., Pharmacist. Upon being relieved by Pharmacist Berkowitz, directed to proceed to Lexington, Ky., and report to Surgeon John McMullen for duty in field investigations of trachoma. Jan. 19, 1914.

White, J. H., Surgeon. Authorized to proceed to Chicago, Ill., Feb. 7, 1914, to attend meeting of the Committee of the American Medical Association. Jan. 27, 1914.

Carrington, P. M., Surgeon. Directed to proceed to San Francisco, Cal., when necessary, in the investigation of the migration of tuberculous persons in interstate traffic. Jan. 20, 1914.

Woodward, R. M., Surgeon. Granted 2 months' leave of absence from Jan. 19, 1914, on account of sickness. Jan. 19, 1914.

Wertenbaker, C. P., Surgeon. Authorized to accompany battleship Ohio from Charleston quarantine station to the Delaware Breakwater quarantine station and thence to the League Island Navy Yard, Philadelphia, Pa. Jan. 24, 1914.

Lavinder, C. H. Directed, at the request of the Commissioner General of Immigration, to make an examination of an alien, Elje Hoffman, now undergoing treatment at Garfield Hospital. Jan. 24, 1914.

Grubbs, S. B., Surgeon. Directed to proceed, at such times as may be necessary, to Boston, Mass., for observation and consultation regarding re-examination of aliens at that port. Jan. 23, 1914.

von Ezdorf, R. H., Surgeon. Directed, on request of the State Board of Health of North Carolina, to proceed to Raleigh, N. C., for conference and to devise plans for anti-malaria investigations in that state during the coming season. Also directed to stop at Columbia, S. C., en route, to attend the meeting of the Southeastern Sanitary Association to be held there Feb. 12-13, 1914. Jan. 27, 1914.

Robinson, D. E., Surgeon. Directed to proceed to Washington, D. C., and report to the Director of the Hygienic Laboratory for temporary duty precedent to special field studies of tuberculosis. Jan. 26, 1914.

Wille, C. W., Surgeon. Granted 3 days' leave of absence from Jan. 28, 1914. Jan. 27, 1914.

Lloyd, B. J., Surgeon. Directed to confer with secretary, Washington State Board of Health, relative to typhoid fever outbreak. Also to visit cities in the vicinity of Seattle, Wash., on business in connection with measures taken for the suppression of bubonic plague. Jan. 22, 1914.

Bogges, John S., Surgeon. Leave of absence for 1 month from Jan. 1, 1914, amended to read "1 month's leave of absence from Jan. 13, 1914." Jan. 22, 1914.

Roberts, Norman, Passed Assistant Surgeon. Detailed for duty at the state quarantine station, Marcus Hook, Pa., in connection with the fumigation of vessels and quarantine operations on the Delaware river. Jan. 24, 1914.

Collins, G. L., Passed Assistant Surgeon. Directed to proceed to Hindman, Ky., and report to Surgeon John McMullen for duty in connection with the prevention of trachoma. Jan. 21, 1914.

Ridlon, J. R., Passed Assistant Surgeon. Detailed for duty at Philadelphia, Pa., under Senior Surgeon Fairfax Irwin. Jan. 24, 1914.

Gillespie, J. M., Assistant Surgeon. Relieved from duty at Hongkong, China, and directed to proceed to San Francisco quar-

antine, Angel Island, Cal., and report arrival to Bureau. Jan. 21, 1914.

Watkins, J. A., Assistant Surgeon. Granted 5 days' leave of absence from Jan. 16, 1914, on account of sickness. Jan. 24, 1914.

Brown, F. L., Pharmacist. Granted 2 days' leave of absence, Jan. 24-25, 1914. Jan. 23, 1914.

Stoner, G. W., Senior Surgeon. Granted 6 days' leave of absence, beginning Jan. 24, 1914, under paragraph 193, Service Regulations. Jan. 29, 1914.

Lumsden, L. L., Surgeon. On request of the State Board of Health of Maryland, directed to proceed to Rockville, Md., and make an investigation of the origin and prevalence of typhoid fever in that town and vicinity. Feb. 2, 1914.

Frost, W. H., Passed Assistant Surgeon. Directed after completion of duties in Pittsburgh, Pa., to proceed to Bureau for conference relative to investigations of pollution of Ohio river. Jan. 28, 1914.

Fairbanks, G. D., Acting Assistant Surgeon. Leave of absence for 15 days from Jan. 10, 1914, amended to read, "12 days' leave of absence from Jan. 10, 1914." Jan. 24, 1914.

Hamilton, H. J., Acting Assistant Surgeon. Granted 2 days' leave of absence from Jan. 31, 1914. Jan. 30, 1914.

Letton, H. P., Sanitary Engineer. On request of the State Board of Health of North Carolina, directed to proceed via Raleigh to Clinton, N. C., to advise with the authorities as to the best source of a public water supply. Jan. 29, 1914.

LaGrange, J. V., Pharmacist. Granted 4 days' leave of absence, Jan. 24, 26, 27 and 28, 1914. Feb. 2, 1914.

Glennan, A. H., Assistant Surgeon General. Granted 9 days' leave of absence on account of sickness under paragraph 209, Service Regulations. Feb. 9, 1914.

Banks, C. E., Senior Surgeon. Granted 4 days' leave of absence from Feb. 20, 1914. Feb. 6, 1914.

Guiteras, G. M., Surgeon. Relieved from duty at Galveston, Tex., and directed to proceed to Key West, Fla., and assume charge of the Marine Hospital at that port. Feb. 4, 1914. Granted 1 month's leave of absence from date of relief at Galveston, Tex.

Nydegger, J. A., Surgeon. Leave of absence for 1 month from Jan. 8, 1914, on account of sickness, amended to read, "27 days'

leave of absence from Jan. 8, 1914, on account of sickness." Feb. 6, 1914.

Anderson, J. F., Surgeon. On request of the State Board of Health of Kentucky, directed to proceed to Richmond, Va., Feb. 10, 1914, for conference with the Commissioner of Health, and for the purpose of presenting an address before the Medical College of Virginia on "Recent Advances in the Study of the Exanthemata." Feb. 9, 1914.

Bahrenburg, L. P. H., Surgeon. Directed to relieve Surgeon G. M. Guiteras and assume charge of all work of the Service carried on at Galveston, Tex. Feb. 4, 1914.

Wilson, R. L., Surgeon. When relieved from duty in charge of the Galveston quarantine station, by Passed Assistant Surgeon H. M. Manning, directed to proceed to Ellis Island, N. Y., for assignment to duty. Granted 21 days' leave of absence when relieved by Past Assistant Surgeon Manning. Feb. 9, 1914.

Manning, H. M., Passed Assistant Surgeon. When relieved from duty in charge of the Marine Hospital at Key West, Fla., directed to proceed to the Charleston quarantine station and assume charge of the Service at that port. Feb. 4, 1914.

deValin, Hugh, Passed Assistant Surgeon. Directed to proceed to Philadelphia, Pa., for inspection of unserviceable property in charge of Senior Surgeon Fairfax Irwin. Feb. 6, 1914.

Kolb, L., Passed Assistant Surgeon. Granted 4 days' leave of absence returning to station at Ellis Island, N. Y. Feb. 4, 1914.

Gillespie, J. M., Assistant Surgeon. Directed to proceed from San Francisco, Cal., to Washington, D. C., and report to the Director of the Hygienic Laboratory for duty. Feb. 5, 1914.

Carmelia, F. A., Assistant Surgeon. Relieved from duty at Ellis Island, N. Y., and directed to proceed to Galveston, Tex., and report to Surgeon L. P. H. Bahrenburg for duty. Feb. 4, 1914. Granted 3 days' leave *en route* to station. Feb. 9, 1914.

Frank, Leslie, Sanitary Engineer. Directed to proceed from Colgate, Md., to Washington, D. C., and report to the Director of the Hygienic Laboratory for conference and instructions. Feb. 4, 1914.

Streeter, Harold W., Sanitary Chemist. Directed to proceed from Baltimore, Md., stopping at Washington, D. C., for conference, to Cincinnati, Ohio, and report to

Passed Assistant Surgeon W. H. Frost for duty in the investigations of the pollution of the Ohio river. Feb. 7, 1914.

Smith, E. E., 2nd Sanitary Bacteriologist. Directed to proceed from Madison, Wis., by way of Cincinnati, Ohio, to Pittsburgh, Pa., for duty in the investigations of the pollution of the Ohio river. Feb. 5, 1914.

Brown, F. L., Pharmacist. Granted 1 day's leave of absence, Feb. 12, 1914. Feb. 10, 1914.

Iltis, George W., Pharmacist. Granted 4 days' leave of absence from Jan. 17, 1914, under paragraph 214, Service Regulations. Jan. 27, 1914.

Wolfe, J. A., Pharmacist. Relieved from duty at the Pensacola (Fla.) quarantine station and directed to proceed to Philadelphia, Pa., and report to Senior Surgeon Fairfax Irwin for duty. Feb. 4, 1914.

Cofer, L. E., Assistant Surgeon General. Directed to proceed to New York, N. Y., for the purpose of delivering an address before the Medical Society of New York, at the New York Academy of Medicine on the subject "National Quarantine." Also to visit the Marine Hospital, Stapleton, N. Y., to ascertain the necessity for additional attendants. Feb. 10, 1914.

White, J. H., Surgeon. Granted 5 days' leave of absence from Feb. 18, 1914. Feb. 17, 1914.

Woodward, R. M., Surgeon. Leave of absence for 2 months from Jan. 19, 1914, on account of sickness, amended to read "2 months' leave of absence from Jan. 19, 1914." Feb. 17, 1914.

Cumming, H. S., Surgeon. Directed to utilize the S. S. Bratton in investigations of the pollution of navigable tidal waters of Maryland and Virginia, in so far as possible, for laboratory and investigation purposes. Also to proceed overland, or detail assistants for like duty, from Washington to points on the Chesapeake bay watershed to make sanitary surveys and obtain needed laboratory supplies. Feb. 11, 1914.

McMullen, John, Surgeon. On request of the Secretary of the State Board of Health of Indiana, detailed to attend the meeting of the Indiana Sanitary and Water Supply Association to be held in Indianapolis, Ind., Feb. 26-27, 1914. Feb. 17, 1914.

Goldberger, Jos., Surgeon. Directed to proceed to Savannah and Milledgeville, Ga., and Spartanburg, S. C., to inspect the opera-

tions of the Service in respect to pellagra investigations at those points. Feb. 17, 1914.

Schereschewsky, J. W., Surgeon. Detailed to attend the meeting of the New York State Ventilation Commission, to be held in New York City, Feb. 17-18, 1914. Also to visit the American Museum of Safety and investigate safety devices intended for protection of those engaged in different occupations. Feb. 17, 1914.

Wilson, R. L., Surgeon. At the request of the President of the Georgia State Industrial College, Savannah, Ga., detailed to attend the Farmers' Conference to be held at Savannah, Ga., Feb. 18-19, 1914, for the purpose of delivering two lectures on tuberculosis. Feb. 11, 1914.

Frost, W. H., Passed Assistant Surgeon. On request of the Secretary of the State Board of Health of Indiana, detailed to attend the meeting of the Indiana Sanitary and Water Supply Association to be held in Indianapolis, Ind., Feb. 26-27, 1914. Feb. 17, 1914.

Slaughter, W. H., Assistant Surgeon. Directed to report to the Commanding Officer of the U. S. Revenue Cutter Seneca for duty in connection with the ice patrol in the North Atlantic Ocean. Feb. 13, 1914.

Gahn, Henry, Pharmacist. Relieved from duty at the Purveying Depot, Washington, D. C., and directed to proceed to New Orleans, La., and report to the medical officer in charge of the Marine Hospital for duty and assignment to quarters. Feb. 13, 1914.

Miller, Charles, Pharmacist. Relieved from duty at the Marine Hospital, New Orleans, La., and directed to proceed to Key West, Fla., and report to the medical officer in charge of the Marine Hospital for duty and assignment to quarters. Feb. 13, 1914.

Spangler, L. C., Pharmacist. Relieved from duty at the Bureau, and directed to report to Assistant Surgeon General W. G. Stimpson for duty in the Purveying Depot, Washington, D. C. Feb. 14, 1914.

Ryder, L. W., Pharmacist. Relieved from duty at the Hygienic Laboratory, Washington, D. C., and directed to proceed to Mobile, Ala., and report to the medical officer in charge of the Marine Hospital for duty and assignment to quarters. Feb. 10, 1914.

Itlis, G. W., Pharmacist. Relieved from duty at the Marine Hospital, Key West, Fla., and directed to proceed to the Pensacola quarantine station and report to the medical

officer in charge for duty and assignment to quarters. Feb. 13, 1914.

Keen, W. H., Pharmacist. Relieved from duty in connection with plague suppressive measures in California, and directed to proceed to Washington, D. C., and report at the Bureau for duty. Feb. 13, 1914.

Ritter, Clyde, Pharmacist. Relieved from duty at the Marine Hospital, Vineyard Haven, Mass., and directed to proceed to Washington, D. C., and report to the Director of the Hygienic Laboratory for duty. Feb. 10, 1914.

RUPERT BLUE,
Surgeon General.

Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,
From 2342 Albion Place, St. Louis, Mo.
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or type-written.

ALPERS, W. C.,
From City Island, N. Y.
To 14th and Central Ave., Cleveland, Ohio.

BAILEY, FREDERICK.
From 142 First St., Lowell, Mass.
To 65 Merrimack St., Lowell, Mass.

BREWER, H. D.,
From 19 Oxford St., Worcester, Mass.
To 4 Congress St., Worcester, Mass.

BROWN, A. E.,
From Jolo, P. I.
To Attending Surg., Office (Estado Mayor), 17 Nebraska, Manila, P. I.

BURDETTE, B. C.
From McLean Hospital, Waverly, Mass.
To 38 High St., Clinton, Mass.

CRAWFORD, A. E.,
From Stanford Univ., Cal.
To Stanford Med. School, San Francisco, Cal.

DE COSTER, H. W.
From 304 Boston St., Lynn, Mass.
To P. O. Box 145, Lynn, Mass.

- DOOLITTLE, R. E.,
From Washington, D. C.
To 109 Hillside Ave., Glen Ridge, N. J.
- ELDRED, FRANK R.,
From 3323 Kenwood Ave., Indianapolis, Ind.
To 3325 Kenwood Ave., Indianapolis, Ind.
- ESTABROOK, H. A.,
From Fitchburg, Mass.
To Cor. Main and Prichard Sts., Fitchburg, Mass.
- FENDER, W. E.,
From Fort Poster, N. Y.
To Fort Adams, R. I.
- GROSS, S. V. R.,
From Livingston, Montana.
To 12 No. Main St., care C. B. Hoskins & Co., Butte, Montana.
- HANCE, E. H.,
From Cor. Callowhill, Philadelphia, Pa.
To Cor. Marshall and Callowhill, Philadelphia, Pa.
- HUGHES, JOHN R.,
From Idaho Falls, Idaho.
To residence unknown.
- IRWIN, C. H.,
From Fort Stanton, N. Mexico.
To Fairport Harbor, Ohio.
- JEHLIK, A. J.,
From 3401 West 26th St., Chicago, Ill.
To S. W. Cor. Homan and 26th St., Chicago, Ill.
- KELLEY, GUS A.,
From Boston, Mass.
To 11 School St., Dorchester, Mass.
- KNABE, G. A.,
From Court Sq. and Dexter Ave., Montgomery, Ala.
To Dexter Ave. and S. Perry St., Montgomery, Ala., P. O. B. 87.
- KNOWLTON, GEO. H.,
From 728 to 782 Union St., Manchester, N. H.
- KUENZIG, PETER A.,
From Pittsburgh, Pa.
To 316 Atlantic Ave., McKeesport, Pa.
- LILLY, J. K.,
From 1500 N. Meridian St., Indianapolis, Ind.
To 4 W. St. Joe, Indianapolis, Ind.
- MILLER, E. R.,
From Auburn, Ala.
To 214 N. Murray St., Madison, Wis.
- O'GORMAN, T. V.,
From New York City, N. Y.
To 2009 Vallejo St., San Francisco, Cal.
- PEARSON, W. A.,
From 35 Poplar St., Philadelphia, Pa.
To 209 N. 50th St., Philadelphia, Pa.
- PERKINS, R. L.,
From —.
To 505 Freeman St., Valparaiso, Ind.
- RIESS, H. W.,
From Detroit, Mich.
To Office Div. Surgeon, 2d Div., Texas City, Texas.
- ROSE, MARTIN,
From Ft. Barry, Cal.
To Vancouver Barracks, Wash.
- SCHLOSSER, PETER,
From 132 Chestnut St., Louisville, Ky.
To 639 Second St., Louisville, Ky.
- SCHRODT, JACOB,
From Live Oak and Elm Sts., Dallas, Tex.
To 2000 Elm St., Cor. Harwood, Dallas, Tex.
- SEYFERT, PAUL,
From —, Wis.
To Bradentown, Fla.
- SHARMAN, HERBERT,
From Ft. Sill, Okla.
To residence unknown.
- SMITH, CARL E.,
From San Francisco, Cal.
To residence unknown.
- STUART, MRS. H. A.,
From 2609 3d Ave. S., Minneapolis, Minn.
To 3321 3d Ave. S., Minneapolis, Minn.
- VORDICK, A. H.,
From 2329 Herbert St., St. Louis, Mo.
To 6351 Berlin Ave., St. Louis, Mo.
- WHEELER, A. A.,
From 873 Vermont, Ave., Detroit, Mich.
To 1050 Lawton Ave., Detroit, Mich.
- WILLIAMS, S. W.,
From care Bauer & Black, Chicago, Ill.
To 5415 East End Ave., Chicago, Ill.

The Journal of the American Pharmaceutical Association

Volume III

APRIL, 1914

Entered at the Postoffice at Columbus, Ohio, as Second-Class matter.

THE SENATE AMENDMENTS TO THE HARRISON BILL.

AS is well known, the Harrison Bill, (H. R. 6282) seeks to require registration with Collectors of Internal Revenue of every person who produces, deals in, sells or distributes opium or coca leaves, their derivatives or preparations; and also levies upon such registrants a tax of \$100 annually.

Orders for any of the named drugs or preparations must be written in duplicate upon official order blanks which can be obtained only from collectors of internal revenue.

Persons not registered as dealers cannot obtain these order blanks, and hence cannot purchase the drugs for resale or consumption, though certain provisos permit physicians, dentists and veterinarians to dispense to their bona fide patients, and pharmacists to fill the prescriptions of physicians, dentists, and veterinarians without the furnishing of an order blank by the patients to whom they are dispensed.

By this means the bill aims to trace the drugs from their entry into the country to the hands of their last distributors, and thus afford to the several states the opportunity of obtaining evidence necessary to secure conviction for violation of the state laws.

The bill does not in express terms attempt to prohibit the sale of the drugs, because such a prohibition would not be within the powers conferred upon Congress by the Federal Constitution. Incidentally, however, it would operate as a strong deterrent to the illegitimate traffic by the requirement of the registration of dealers, the use of a specified official order blank which can be obtained only from collectors of internal revenue, and the evidence which the operation of the act will provide for the use of local prosecutors.

The bill has been reported out by the Committee on Finance, which has had it under consideration, and is now upon the Senate Calendar as No. 213.

In its passage through the committee the bill received several important amendments. One of these is the inclusion of dealers in hypodermic syringes or needles adapted to administer any of the drugs, who will now be required to register the same as dealers in the drugs themselves, and the sale of these articles can be made only on orders written upon the official order blank.

The wisdom of this amendment is not apparent. The possession of a hypodermic syringe or needle is not essential to the use of the drugs by habitues, and as a matter of fact the vast majority of them do not employ the hypodermic syringe at all. Hypodermic syringes are, however, used extensively as containers of serums and other medicaments in order to insure their perfect sterility up to the moment of administration. Why should the sale of such necessary medicaments be hampered by a restriction which is altogether useless as a measure for controlling the use of habit-forming drugs?

Two other amendments make it clear that officers of the State and Federal Governments may make purchases of the drugs for the various departments of the Army and Navy, and for government and state hospitals, and may have possession of them for such public purposes, without registration as dealers. Singularly enough, however, no means are provided whereby the dealer may sell to such persons without an order blank.

Another amendment, and one which may greatly affect the efficiency of the Act, is the change made in Sub-section a of Section 2, which originally relieved the physician, dentist or veterinary surgeon from requiring an order blank from his patient, "provided, however, that such physician, dentist, or veterinary surgeon shall personally attend upon such patient." From this proviso the words "personally attend upon such patient" have been stricken out, and replaced by "provided any such physician, dentist or veterinary surgeon shall have been specially employed to prescribe for the particular patient receiving such drug or article."

It is reported that the Committee was induced to make this change through the efforts of a manufacturer of a proprietary asthma cure which is said to contain a small proportion of cocaine, and to be widely used throughout the United States. It is advertised only through the mails, and is not sold through drug stores. Its proprietor is a physician who, it is said, operates by sending blank forms to be filled out by the patient. Since the filling of such a blank and the ordering of the medicine would create a specific contract between the physician and the patient, the amendment will relieve both parties from the obligations of the Act.

While it is possible that the proprietary remedy is harmless enough in itself, and would not be likely to either create or satisfy the cocaine habit, it is unfortunate that the Senate Committee found it necessary to open the door so widely to possible abuse. Any physician who is disposed to supply habitues with the drugs will be able to claim, and to prove by his own testimony and the testimony of the alleged patient, that he was specially employed in the case although he may never have seen the person.

The original reading that the physician should "personally attend such patient," would have required at least one bona fide consultation and examination.

The defect, unfortunately, is one which cannot be cured by state legislation,

because the drugs can be sent direct from the manufacturer in one state to a consumer in another, and thus will be under the protection of interstate commerce.

In addition to the above amendments, several others of minor character have been inserted here and there throughout the bill, such as extending the application of the act to the territories and Insular Possessions of the United States, and so on, most of which are unobjectionable. One, however, requires the statement on the label of the quantity of drug contained in certain preparations which are excepted from the operations of the Act, namely, those which do not contain more than 2 grains of opium, $\frac{1}{4}$ of a grain of morphine, $\frac{1}{12}$ of a grain of heroin, or 1 grain of codeine, etc., in a fluid- or avoirdupois-ounce. If this applies only to proprietary remedies, it is needless, since the subject is already covered by the Food and Drugs Act. If it can be held to apply to medicines compounded on physicians' prescriptions, it will be highly objectionable to both pharmacists and physicians, since the reason for excepting such preparations from the operations of the act is that they are not calculated either to create or satisfy a drug habit.

The Senate Committee not only made amendments of its own, but rejected those recommended by the National Drug Trade Conference at its January meeting. One of these recommendations was to strike out from Sub-section b of Section 2, the words "registered under this Act," so that the pharmacist would not be liable if he filled the prescription of a physician who was not registered under the act. The recommendation was a proper one, made after due consideration, and should have been heeded by the committee. Fortunately, the other requirements of the bill are such that practically all physicians will be compelled to register, and hence the danger to the druggist who is reasonably cautious and acts in good faith will not be great.

Another recommendation which the Senate Committee refused to adopt was one to substitute the word "dealer" for the word "druggist" in Sub-section b of Section 2. This recommendation was made because it has been alleged that the act would be unconstitutional, for the reason that it would favor a particular class of dealers, to wit, pharmacists, over all other classes of dealers, in that while paying the same tax as the pharmacist, the latter would have special privileges in dispensing.

The effect of the Senate Committee's amendments was carefully considered at a special meeting of the Executive Committee of the National Drug Trade Conference held at Washington, D. C., March 18, when a memorial was adopted setting forth the objections of the Conference to the changes made in the bill, and renewing its recommendations for the changes asked for by the Conference at its January meeting.

Some of the friends of the bill are predicting its early passage in practically its present form, but it would not be greatly surprising if the number of other pending measures of greater political importance, and the pressure of congressmen for an early adjournment should result in a postponement of the bill until another session.

THE BICHLORIDE SITUATION.

ORDINARILY the stream of Council business, as reported in the letters which are issued between meetings, flows with scarcely a ripple of debate. This is not because the Councilors are inattentive to the letters or are afraid to express their opinions in opposition, but rather because propositions of a controversial nature are generally held for consideration at the annual meeting, and the questions submitted for mail vote are usually of a formal kind not calculated to provoke debate. Council Letter No. 13, which appears in this issue, and in which Chairman Hugh Craig, of the Section on Education and Legislation, and President George M. Beringer discuss the advisability of adopting a specific shape for bichloride or other highly poisonous tablets, presents an interesting exception to the usual order.

Mr. Craig contends, and his contention is undoubtedly correct, that the frequent cases of alleged accidental poisoning with bichloride tablets are not accidental in fact, but that the tablets are taken with suicidal intention. He also argues that if a person is bent upon self-destruction he will certainly accomplish his purpose, no matter how many restrictions be placed upon the dispensing of poisons, and further, that peculiar shapes or colors for dangerous tablets will not operate as warnings to children.

Mr. Craig's remedy would be to restrict the dispensing of mercury bichloride to physicians' prescriptions, coupled with restrictions which would prevent physicians from leaving such tablets with patients without cautionary wrappings.

Undoubtedly such restrictions would lessen the number of poisonings from bichloride, but this raises the question as to the extent to which such restrictions should be placed upon other poisonous compounds generally and upon dealers other than druggists. If we are to restrict the sale of mercuric bichloride to physicians' prescriptions, why not place the same restrictions upon all drugs which can be used suicidally or which may be taken by mistake for less dangerous ones? And if such restrictions are to be placed upon articles dispensed from drug stores, why should they not be placed equally upon dangerous substances for sale at the paint store or elsewhere? Thoughtless people, while generally ready to applaud restrictions laid upon the druggist in the name of public safety, are generally strongly opposed to legislation that would prevent their obtaining poisonous insecticides and other substances used in agriculture or the arts.

Some years ago the writer, in a paper presented at one of the meetings of this Association, called attention to several state laws which placed heavy penalties upon druggists for selling poisons without certain precautions of labeling and registration, but leaving it open to all other dealers of the state to sell the same articles without restriction. Even at the present time there is a bill pending in Congress greatly limiting the manner in which registered physicians and druggists may sell or dispense mercury bichloride, but not placing any limitation whatever upon its sale by other persons.

Unless we are careful in the endorsement of restrictive legislation, we shall some day awaken to the fact that the druggist is bound hard and fast, while the

paint stores, hardware stores, and other dealers in insecticides are free to sell equally dangerous substances practically without restriction.

The teaching of this is that, since it would be manifestly impossible to restrict the sale of all dangerous poisons to physicians' prescriptions, and manifestly unfair to place such restrictions upon the druggist and leave all other dealers free, then the next best thing, and the thing which is altogether feasible and capable of universal application is to require the indication of the poisonous character of dangerous compounds by appropriate labels, shapes and colors of packages, or other warnings which would appeal to the senses of those who might otherwise handle the articles carelessly. For the would-be suicide, of course, no warning would suffice.

Whatever restrictions are adopted should apply equally to all dangerous substances as well as to those usually handled by the druggist, and to all dealers and distributors alike.

As to the wisdom of the Association's taking over the assignment of the patent which has been applied for by the Norwich Pharmacal Company, on coffin-shaped tablets of mercury bichloride, several considerations present themselves.

If the Association accepts the assignment, it would, of course, accept it simply as a trustee for the public welfare. It would permit all manufacturers to use the design without charge, and would exercise its rights as owner of the patent only in case some one should presume to make use of the design in a freak conception.

If the Association does not accept the assignment tendered by the Norwich Pharmacal Company, the latter will be entitled to prevent any rival manufacturer from using the same design unless licensed for that purpose.

It should be borne in mind that the granting of a patent for a coffin-shaped tablet would not prevent the patenting or copyrighting of other designs, and also that final decision as to what designs shall be lawful or unlawful will remain with the law-making powers.

City councils, state legislatures, and Congress will be besieged constantly for the enactment of bichloride legislation, and will undoubtedly take action. We may protest against such legislation until we are out of breath, without avail. Ordinances and laws will be adopted by the dozen, and no two of them will be alike or in correspondence unless we can set a national standard, as for example, by the adoption by the Pharmacopœia of a specific, or perhaps of several permissible designs, which can be cited for the guidance of the various legislative bodies.

We cannot stop the flood of bichloride legislation, but we can to a large extent direct it into safe and practical channels; and this it seems to me, is the discreet and politic thing to do.

J. H. BEAL.

PRICE STANDARDIZATION.

AT the Second Annual Meeting of the United States Chamber of Commerce held in Washington the week of February 9, last, one of the leading subjects of discussion was that one of paramount importance, not only to the members of our profession but to all retail merchants,—“Price Protection.”

This cause which has been so long discussed and which so many times seemed almost to have received its death-blow, was there stimulated into new and vigorous life, one which gives promise of bringing relief to the retail-traders of the nation from the vexatious and distressing conditions which have so long affected them.

There is hope for the patient when the cancerous growth has been removed and there is hope for the retail business-interests of the country when the vicious and cancerous condition which has so harmfully affected trade shall have been eliminated from it.

So all thoughtful and hopeful men turn their eyes toward this gathering as to a harbinger of good tidings as they read of the enthusiasm shown in the hearty support given to this question in such an influential organization as the U. S. Chamber of Commerce, a body representing a membership of more than half a million of the business men of the country.

The session of Friday, February 13, was devoted almost entirely to this important question. The Hon. Joseph E. Davies, the U. S. Commissioner of Corporations, spoke upon the subject, naturally not committing himself upon so important a question, which was one, he said, that “in the matter of living affects very vitally the great body of consumers in this country.” He said that the Bureau of Corporations was engaged in making a study of the question and that it was its purpose to make that investigation “fair and impartial, without preconceived bias, prejudice or judgment.” Mr. William H. Ingersoll delivered a notable address, in which he said that, “Price Standardization is the term that describes the system best to my mind; not high prices, but standard prices to all, the same thing for the same money to all upon fair and equal terms.” He strongly condemned the methods of those who by means of misleading advertisement and misrepresentation filched from their fellow-citizens their good name and the return they were rightfully entitled to by their enterprise, their toil and thought. Mr. Ingersoll’s able speech stirred his auditors to applause and at the close of his address he was given an ovation. Mr. Donald Dey, of Syracuse, N. Y., while saying that he looked upon price-cutting as a menace and that some saner method of attracting business should be adopted, counseled delay in seeking legislation to remedy the evil. He felt sure “that when the subject had been brought seriously to the attention of the average merchant that the ethical side would appeal strongly to him, that his views would be changed and with a change of view will come a change of method.” In what way this was to be accomplished Mr. Dey did not say, but, judging from past experience in trying to influence the cut-price merchants into a sane way of doing business, his method would bear fruit at about the time the millennium was due.

A Bill, (the Stevens Bill, H. R., 13305), which apparently had its inception at this meeting is given publicity in the Washington News Letter of the Journal of the N. A. R. D. and support for which is asked of all the members of the trade by writing to their representatives in Congress. Deprived of its verbiage the purpose of this bill is to make it "Lawful for a manufacturer to prescribe the sole and uniform price at which each article covered by contract shall be sold." That is, if this bill should become a law, it will make legal that which the Supreme Court decided in the Miles case was unlawful, "was against public policy and void," and manufacturers can lawfully fix the price at which their products shall be sold.

The full text of this bill is as follows:

That in any contract for the sale of articles of commerce to any dealer, wholesale or retail, by any producer, grower, manufacturer, or owner thereof, under trade-mark or special brand, hereinafter referred to as the "vendor," it shall be lawful for such vendor, whenever the contract constitutes a transaction of commerce among the several states, or with foreign nations, or in any territory of the United States, or in the District of Columbia, or between any such territory and another, or between any such territory or territories and any state or the District of Columbia, or with a foreign nation or nations, or between the District of Columbia and any state or states or a foreign nation or nations, to prescribe the sole, uniform price at which each article covered by such contract may be resold: *Provided*, that the following conditions are complied with:

(A) Such vendor shall not have any monopoly or control of the market for articles belonging to the same general class of merchandise as such article or articles of commerce as shall be covered by such contract of sale; nor shall such vendor be a party to any agreement, combination, or understanding with any competitor in the production, manufacture, or sale of any merchandise in the same general class in regard to the price at which the same shall be sold either to dealers at wholesale or retail or to the public.

(B) Such vendor shall affix a notice to each article of commerce or to each carton, package, or other receptacle inclosing an article or articles of commerce covered by such contract of sale stating the price prescribed by the vendor at the time of the delivery of said article as the uniform price of sale of such article to the public, and the name and address of such vendor, and bearing the said trade-mark or special brand of such vendor. Such article or articles of commerce covered thereby shall not be resold except with such notice affixed thereto or to the cartons, packages, or other receptacles inclosing the same.

(C) Such vendor shall file in the Bureau of Corporations a statement setting forth the trade-mark or special brand owned or claimed by such vendor in respect of such article or articles of commerce to be covered by such contract of sale, and also, from time to time, as the same may be adopted or modified, a schedule setting forth the uniform price of sale thereof to dealers at wholesale, and the uniform price of sale thereof to dealers at retail from whatever source acquired and the uniform price of sale thereof to the public, and upon filing such statement such vendor shall pay to the Commissioner of Corporations a registration fee of \$10. The price to the vendee under any such contract shall be one of such uniform prices to wholesale and to retail dealers according as such vendee shall be a dealer at wholesale or a dealer at retail, and there shall be no discrimination in favor of any vendee by the allowance of a discount for any cause, by the grant of any special concession or allowance, or by the payment of any rebate or commission, or by any other device whatsoever.

(D) Any article of commerce or any carton, package, or other receptacle in-

closing an article or articles of commerce covered by such contract and in possession of a dealer may be sold for a price other than the uniform price for resale by such dealer as set forth in the schedule provided in the next preceding paragraph (C): First, if such dealer shall cease to do business and the sale is made in the course of winding up the business of such dealer, or if such dealer shall have become bankrupt, or a receiver of the business of such dealer shall have been appointed, provided that such article or articles of commerce shall have first been offered to the vendor thereof by such dealer or the legal representative of such dealer by written offer at the price paid for the same by such dealer, and that such vendor, after reasonable opportunity to inspect such article or articles, shall have refused or neglected to accept such offer, or, second, if such article of commerce or contents of such carton, package, or other receptacle shall have become damaged, deteriorated, or soiled: *Provided*, that such damaged, deteriorated, or soiled article shall have first been offered to the vendor by such dealer by written offer, at the price paid for the same by such dealer, and that such vendor, after reasonable opportunity to inspect such article or articles, shall have refused or neglected to accept such offer, and that such damaged, deteriorated, or soiled article shall thereafter only be offered for sale by such dealer with prominent notice to the purchaser that such article is damaged, deteriorated, or soiled, and that the price thereof is reduced because of such damage.

It may be said that the proposed bill is not as precise in its terms nor does it seem so well-contrived to produce the reform desired as the bill endorsed, we understand by the American Fair Trade League. That law made it imperative upon dealers to fix a selling-price upon their product under penalty of losing the protection of the patent, copyright or trade-mark laws, and also declared it unlawful to sell or to offer goods for sale at a price different from the fixed price, under penalty of a fine of not less than \$100.00 nor more than a \$1000.00. The proposed law (H. R. 13305) does not forbid, except by inference, the sale of goods at a price differing from that specified by the maker thereof, nor does it provide any penalty for so doing. A court might construe the law to mean that goods should be sold only at the fixed price, and it might not, and nowhere in the proposed law as it is in the other, is it declared unlawful to "break the price." It seems as though the law might just as well be made a positive and an unevadable law, a law "with teeth in it" for those who have shown themselves so unscrupulous and so careless of the welfare of their fellowmen, instead of being one with loopholes through which these selfish persons may escape the consequences of evil doing.

The proposed law is a good one; a step in advance, but a longer stride in the same direction can be made with almost the same effort, by means of which, hope for reform will not be disappointed and the results which all honorable men of the trade have long desired will be achieved.

The Metz Bill (H. R. 13860) is another bill which seeks with much expanse of language to make price-regulation lawful and, in but one way and that a doubtful one does it appear superior to the Stevens Bill. It makes it legal to establish uniform retail selling prices like the former and further provides that any person who "shall violate either the wholesale or retail uniform selling price of a uniform commodity, shall be liable to an action for damages and an injunction at the suit of any proprietor, dealer or consumer who deals in or with or in consuming such uniform commodity."

The text of the Metz Bill is as follows:

To prevent discrimination between different consumers and localities by establishing uniform prices for uniform commodities.

Whereas experience has demonstrated the advantages and protection to the consumer of standard or uniform commodities marketed under the trade-mark of the proprietor who originates the commodity and who by careful and responsible business methods and guaranties, and by constant maintenance of the excellence of the commodity, builds up a reputation and standard or uniform value for the commodity, and who thus creates and owns the good will connected therewith; and

Whereas it is desirable that consumers shall be able to purchase uniform commodities in all localities at uniform prices, whereby to prevent discrimination between different consumers and localities; and

Whereas uneven prices for the same uniform commodity tend to effect discrimination between different localities and consumers, and to depreciate the quality of the commodity, and to destroy competition in that commodity and to monopolize the sale of the same, and to deceive consumers as to the value of the commodity, and otherwise and wrongfully to appropriate and impair the good will of the originating proprietor; and

Whereas under existing law proprietors possessing large capital, resources, and facilities, through their consequent ability to maintain branch establishments or sole agents throughout the country for fixing uniform prices for uniform commodities, are enabled to discourage competition, to deprive retailers of their independence, and to prevent them from handling competing commodities, and otherwise to exercise an unfair advantage over smaller competitors; and

Whereas the increased expense of maintaining branch establishments or sole agencies increases the price of commodities to the consumers; and

Whereas uniform prices facilitate the wide and steady distribution of uniform commodities and thus tend to lower the price to consumers by lowering the cost of production and distribution: Now, therefore,

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the following terms and phrases in this Act are used and inserted with the sole sense, meaning, and definitions now set forth:

A "uniform commodity" is hereby declared and defined to be any article, product, or commodity which enters into interstate commerce, and which is standard or uniform in grade, size, and quality with other articles, products, or commodities of the same price of the same proprietor, and which has affixed, printed, stamped, embossed, engraved, or otherwise marked thereon or applied or attached thereto, in any manner, or to the package, can, bottle, box, or other container, receptacle, or covering of any character whatever, in which the article, product, or commodity is packed, contained, or inclosed, the trade-mark or trade-name of the proprietor of said article, product, or commodity, which trade-mark or trade-name has been properly registered in the United States Patent Office under the terms and provisions of the Act entitled "An Act to authorize the registration of trade-marks used in commerce with foreign nations or among the several states or with Indian tribes, and to protect the same," as enacted February twentieth, nineteen hundred and five, and as now, as well as hereafter, amended, together with the notice of the registration of said trade-mark or trade-name, as required by said Act.

A "proprietor" is hereby declared and defined to be any person, firm, corporation, or association engaged in manufacturing, selecting, packing, distributing, printing, publishing, or otherwise producing or preparing for the market any uniform commodity under a trade-mark or trade-name, owned by said proprietor, and which has been registered by said proprietor, or his predecessors in business,

in the United States Patent Office, under the terms of an Act entitled "An Act to authorize the registration of trade-marks used in commerce with foreign nations or among the several states or with Indian tribes, and to protect the same," as enacted February twentieth, nineteen hundred and five, and as now, as well as hereafter, amended.

A "dealer at wholesale" is hereby declared and defined to be any person, firm, corporation, or association who or which distributes or sells any uniform commodity to any dealer for resale.

A "dealer at retail" is hereby declared and defined to be any person, firm, corporation, or association who or which sells any uniform commodity direct to any consumer.

A "consumer" is hereby declared and defined to be any person, firm, corporation, or association who or which purchases any uniform commodity for ultimate consumption or use.

The expression "interstate commerce," as used herein, is hereby declared and defined to mean commerce between the United States and foreign nations, or among the several states, or between a state or states and places subject to the jurisdiction of the United States, or between any territory of the United States, and in and between such territory or territories and any state or states and the District of Columbia, or places under the jurisdiction of the United States, or between the District of Columbia and any state or states and foreign nations or places under the jurisdiction of the United States.

Sec. 2. That the proprietor of any uniform commodity, entering into interstate commerce, may establish a uniform retail selling price for such commodity to all consumers, wherever located, after making due allowance, at the option of the proprietor, for the actual cost of transportation from the point of production or manufacture of such commodity to the point of retail sale or consumption, by a notice of said uniform retail price applied to or connected with said uniform commodity, or served on the dealer either directly or through the usual trade channels: *Provided*, That the purpose and effect of said uniform retail price is to avoid discrimination between different consumers and localities: *And provided also*, That the proprietor shall file in the Bureau of Corporations, as a public record, under rules to be prescribed by said bureau, a uniform price schedule identifying the uniform commodity, and setting forth the uniform price of sale thereof from the proprietor to all dealers at wholesale, and the uniform price of sale thereof from the proprietor and all dealers at wholesale to all dealers at retail, and the uniform retail price of sale from the proprietor and all dealers at either retail or wholesale, to all consumers: *And provided also*, That new uniform price schedules shall always be filed in the Bureau of Corporations not less than thirty days before sales at newly established uniform prices may lawfully be made by the proprietor, such new schedules to apply only to uniform commodities which have notice of the new uniform consumer's price applied thereto or connected therewith.

Sec. 3. That any proprietor or any dealer at wholesale or retail who shall violate either the wholesale or retail uniform selling price of a uniform commodity entering into interstate commerce by charging or accepting, at wholesale or retail, as the case may be, a less price, directly or indirectly, for said commodity than the wholesale or retail uniform price established by the proprietor, shall be liable to an action for damages and an injunction at the suit of any proprietor, dealer, or consumer engaged in producing, or dealing in or with, or in consuming such uniform commodity.

Sec. 4. That any uniform commodity in possession of a dealer at wholesale or retail may be sold for a price other than the uniform price set forth in the uniform-price schedule filed under section two hereof providing such dealer shall cease to do business and the sale shall be in the course of winding up the business of such dealer, or providing such dealer shall have become bankrupt or a re-

ceiver of the business of such dealer shall have been appointed: *Provided*, That in either case above specified such uniform commodity shall have first been offered to the proprietor by the dealer, receiver, or trustee in bankruptcy, or the legal representative of the dealer, by a written offer at the price paid for the uniform commodity by such dealer, and that such proprietor, after reasonable opportunity to inspect such article or articles shall have refused or neglected to accept such offer, or providing such uniform commodity shall have become damaged, deteriorated, or soiled, and providing that such damaged, deteriorated, or soiled article shall have first been offered to the proprietor thereof by the dealer by written offer, at the price paid for the same by such dealer, and that such vendor, after reasonable opportunity to inspect such uniform commodity, shall have refused or neglected to accept such offer, and providing that such damaged, deteriorated, or soiled article shall thereafter only be offered for sale by the dealer with prominent notice to the consumer that such uniform commodity is damaged, deteriorated, or soiled and that the price thereof is reduced because of such damage.

Sec. 5. That nothing in this Act shall be construed as repealing an Act entitled "An Act to protect trade and commerce against unlawful restraints and monopolies," which became a law on the second day of July, in the year eighteen hundred and ninety.

Comprehensive as this bill is apparently intended to be, with its precise definitions of everything connected with its subject, it does not make clear how a consumer could estimate his damages in a transaction where he had purchased goods at a less price than the one fixed, and the bill is somewhat objectionable because it leaves the punishment of the offender to private initiative. It is possible that this bill, with its provision for the punishment of offenders in this way, may be found acceptable, with a view to after amendment by which those who violate the law may be punished by public prosecution. We urge Price Standardization on the ground of the public weal, not to protect individuals, and we say that anyone who cuts prices is acting against the public interests and it would seem as though they should be punished as others are punished who commit offenses of that nature. But this bill, like the other, is to be commended as marking a distinct and positive advance toward better and more hopeful conditions and as such it should meet the approval of all friends of just and honorable methods in trade.

ERNEST C. MARSHALL.

PROPOSED ENTERTAINMENTS AT THE DETROIT MEETING.

IN preparing for the August meeting of the American Pharmaceutical Association the various committees on Entertainment, Finance, and Ladies' Program have gotten down to real work, with every determination to make the '14 convention the Banner Meeting of the Association. They have ample "steam" and funds at their disposal, backed up by the very rich attractions which Detroit offers as a Convention City.

The Michigan travelers of the drug houses, headed by Mr. Frank Kerr, are making it possible to send the Journal of the Detroit Retail Druggists' Association to every druggist in the state. Each issue bears some interesting article or announcement pertaining to the August meeting.

It is expected that the visitors will wish to catch some glimpses of the huge

industrial plants which have made Detroit the greatest manufacturing center in the world for drugs, automobiles, and stoves. The Committee are shaping their arrangements so that small groups can make their own selections for sight-seeing at their convenience. Those desiring it will be welcome to inspect the world-famous Ford plant, or any of the large stove works, or the well-known manufacturing pharmacies.

Entertainment is to be provided for each evening during Convention Week, if this can be done without prejudice to the work of the various sections.

In addition to the regular steamer excursion to the Ste. Claire Flats in which all the delegates and ladies will participate, a special boat ride is on the carpet for ladies only, to charming "Bob-lo" (Bois Blanc), at the mouth of the Detroit

River, where dinner will be served. Theatre parties, card parties, and automobile rides will not be overlooked, though the Committee are not yet able to make definite announcements.

One of the Convention evenings will probably be devoted to a smoker, with proper entertainment.

As for the general attractions by land and water, there is probably not another city on the Continent that offers the varied pleasures which Detroit holds out to the tourist and delegate. Belle Isle, connected by bridge with the city proper, is one of the most beautiful parks in the world. Surrounded by the two arms of the Detroit River, at almost equal distance from the American and Canadian shores, its outside drive is one long feast, charming every inch. The County of Wayne, in which Detroit is situated, is famous for its fine cement motor roads. In every direction one may drive for miles over the smoothest of highways. The facilities for rowing, sailing, and all-day steamer excursions across Lake Erie or Lake Ste. Claire are ideal.

"Where to go" is the perplexing question where there is such embarrassment of riches and the time is limited. Fortunately, the visitor to the August Convention will be spared the necessity of choosing, for he will have the benefit of a carefully planned program in the hands of men who thoroughly know the local ropes.

JOSEPH HELFMAN,
Member of Committee on Publicity.

IODINE IN JAPAN AND SIBERIA.

Crude iodine is produced all along the seacoast of Japan proper, principally in the Prefectures of Chiba, Miye, Kanagawa, Ibaraki, Shidzuoka, and Hokkaido. It is manufactures from a seaweed that is found in great abundance along the southern coast of Japan. The industry is carried on in a small way by numerous individuals and factories. The chief factory is situated at Hayama, near Dzushi, about twenty miles from Yokohama. The subscribed capital of this company is \$17,500.

No statistics of production are available, but the customs returns for 1912 show that 22,772 pounds, valued at \$44,979, were exported to foreign countries in that year, principally to Great Britain, Germany, Hongkong, and Belgium, in the order named. Buyers and commission merchants or their agents go to the manufacturing districts and buy what they can for the exporters in Yokohama and Osaka.

In a report published in December, 1910, it was stated that plans were being made to open a factory at Olga Bay for the manufacture of iodine from the iodine-bearing seaweed to be had in great quantities in that region. The project was dropped and no such factory has ever been built in the district. A Russian firm made experiments and found that iodine exists in commercial quantities in the seaweed. It is said that this concern sold out whatever interest it may have had to a German chemical company that wished to limit competition.

It is understood that in Japan the peasants burn iodine-bearing plants and ship the ashes to Europe. In the Russian Far East this is not done, as the Russian peasants do not understand the proper method of burning the plants and saving the ashes.

Iodine plants grow about Possiet Bay, Expedition Bay, Olga Bay, and other bays in the vicinity. There is a strong odor of iodine in the atmosphere about Expedition Bay, where a sanatorium has been established for sick soldiers, who sleep on beds filled with iodine plants until they are convalescent. As Expedition Bay is not included in the Russo-Japanese fishing convention of 1907, only Russian subjects can work there.—*Daily Consular and Trade Reports*.

Papers Presented at the Sixty-First Annual Convention

INDIVIDUAL VARIATION IN BELLADONNA PLANTS AS A BASIS FOR IMPROVEMENT BY SELECTION.

A. F. SIEVERS, CHEMICAL BIOLOGIST, OFFICE OF DRUG PLANT INVESTIGATIONS,
BUREAU OF PLANT INDUSTRY, U. S. DEPARTMENT OF AGRICULTURE.

The improvement of medicinal plants through the methods and principles of plant-breeding is beginning to receive considerable attention. The quality of many of our important drug plants as found on the market is far from satisfactory and the inability to secure drugs of sufficient strength has in some cases necessitated the lowering of the Pharmacopœial standard. Such a procedure was followed at the eighth decennial revision of the Pharmacopœia with regard to belladonna and stramonium. The supply of wild belladonna is rapidly becoming exhausted and the demands of the drug trade will soon have to be supplied from the cultivated plant. It is of great advantage, therefore, at this time to make concerted efforts toward securing a type of belladonna plant which, when extensive cultivation of the plant is finally resorted to, will produce a product which is of satisfactory and consistent medicinal strength.

With this object in view, the Office of Drug Plant Investigations of the U. S. Department of Agriculture has had in progress for several years a thorough investigation of the belladonna plant under cultivation with special reference to the variation of the alkaloidal content of the plants with a view toward obtaining data so that through the methods of plant-breeding or selection it might be possible to establish a desirable type of plant. This work is now being carried through the third season, and, while only a beginning has been made, the results are sufficiently illuminating to be worthy of presentation.

The investigation has been conducted mostly at the Arlington Experimental Farm at Arlington, Va. Some additional work has been done at the stations in Wisconsin and Maryland, but the largest number of plants have been under observation at Arlington. After some preliminary work, the investigation was finally started with fifty-nine individual plants in the spring of 1911. The plants were then in their second year. They were carefully watched as to growth and general development, and at five different stages samples of leaves were gathered from each plant. The leaves were taken from all parts of the plant, so as to insure a representative sample. After carefully drying the leaves in a well-ventilated room they were placed in light cloth bags until assayed.

The question of assaying required some special attention in order to devise a method suitable for assaying such small samples as those to be dealt with in this

work. Some samples weighed as little as four grams, dry weight, and since all assays were made in duplicate it was necessary to have a method applicable to two grams of material. After considerable experimentation, the Pharmacopœial method in a modified form was adopted. The principal modification of the method consisted in the use of much greater quantities of menstruum for the extraction of the alkaloids, experience having shown that the quantity recommended in the Pharmacopœia is not sufficient.

The stages of growth at which the leaves were gathered were as follows: The first, during the early part of May before the flowers appeared; the second, during the last of May when the plants were in full bloom; the third, about the middle of June when the berries were developing and in various stages of maturity; the fourth, early in September when the berries were mostly ripe; and the fifth, about the middle of October when the plants had grown considerable new leaves.

In a paper of this kind it is, of course, impossible to give all the analytical data of so many individual plants and only a summary will be given. The maximum, minimum, and average percentages of alkaloids in the leaves of these individual plants at each picking in 1911 were as follows:

Picking.	Percent of Alkaloids in Leaves.		
	Maximum.	Minimum.	Average.
	%	%	%
First852	.303	.472
Second879	.267	.528
Third925	.277	.517
Fourth908	.311	.633
Fifth733	.200	.519

In the following season, 1912, these same plants were again under observation and the leaves were picked at corresponding stages of growth. The maximum, minimum, and average percentages of alkaloids in these plants at the various stages were as follows:

Picking.	Percent of Alkaloids in Leaves.		
	Maximum.	Minimum.	Average.
	%	%	%
First869	.404	.601
Second747	.292	.503
Third882	.328	.553
Fourth806	.359	.568
Fifth678	.296	.447

It will be noticed that the range of variation in the individual plants is very great. It is this fact that seems to hold forth great promise of the successful application of plant-breeding and selection methods and it was for the purpose of definitely establishing the existence of such great variations that this investigation was started.

Another fact of vital importance has been established by the two years' work. It has been found that, in a general way, the plants which are very rich or very poor in alkaloids one year will display the same characteristic the following year. Furthermore, these same characteristics are evident at each picking throughout the season. Out of the fifty-nine plants examined, forty were found to retain their characteristics as regards alkaloidal content through both seasons. A few especially characteristic individuals may be given here in detail. Thus No. 3 assayed .384 percent, .375 percent, .277 percent, .549 percent, and .451 percent alkaloids at the different stages in 1911, and .393 percent, .448 percent, and .448 percent in 1912. Again, No. 39 assayed .303 percent, .262 percent, .327 percent, .614 percent, and .451 percent, in 1911, and .404 percent, .365 percent, .525 percent, and .600 percent in 1912. On the other hand, plant No. 7w assayed .558 percent, .831 percent, .832 percent, .727 percent, and .575 percent in 1911, and .782 percent, .666 percent, .646 percent, and .694 percent in 1912. Again, No. 6w assayed .596 percent, .879 percent, .925 percent, .711 percent, and .722 percent in 1911, and .847 percent, .882 percent, .804 percent, and .558 percent in 1912. These four plants illustrate what has been said in regard to the consistency of the individual type from season to season. Plants No. 3 and 39 are manifestly of poor medicinal quality, as compared with the average, while plant No. 6w and plant No. 7w are of exceptional quality. It is plants like the last two named which are being used as a basis for the propagation of a desirable type of belladonna. After the selection of a desirable parent plant, new generations are secured from these through seed or cuttings. The flower of the belladonna plant is usually cross-pollinated, so the question of close pollination must be considered. Thus far, only plants from cross-pollinated seeds have been tested. These plants made their first season's growth last year. Two pickings of leaves were made. These plants were not tested individually, but the leaf samples were taken collectively from all the plants secured from the same parent. It is interesting to note that the plants from the seed of No. 7w and No. 6w showed a high alkaloidal content. Thus plants from No. 7w averaged for the two pickings .804 percent, and those from No. 6w averaged 1.043 percent. It will be seen then that the first generation plants from the two richest parent plants selected showed conspicuous richness in their first season, even though the seeds from which they grew had probably been formed from cross-pollination. These plants, as well as many others, are being carefully observed and tested individually this year, 1913, and it is hoped that a few of very great medicinal strength will be obtained. At the same time, other first generation plants which were grown from inbred seeds from the same parent plants as those above are being grown this year and their leaves will be tested as soon as they have attained a suitable growth. The matter of propagation from cuttings is also being taken up in detail this year.

The plant breeder, in striving to evolve a valuable type of economically important plant, must reconcile two factors. The plant must yield a valuable product and at the same time it must yield enough of this product to make its production a commercial possibility. The problem with belladonna does not differ in this respect. If we are to depend on cultivation for its supply, then such cultivation must be made fairly profitable. The problem, therefore, be-

comes more difficult in that the desirable plant is not one which shows great medicinal qualities alone, but one which at the same time produces an abundance of leaves and roots. In the several years during which this work has been progressing, nothing has been found to indicate that any relationship exists between the physical appearance of the plant and its alkaloidal content. While no such general relationship may exist, there is always the possibility, however, of some of those unusually rich plants possessing at the same time the desired physical excellence which would make them the most valuable type from both the medicinal and the agricultural standpoint.

Much has been said and written concerning the production of alkaloids in belladonna. The influence of various soil constituents, excessive rainfall and drought, sunlight and shade have all been the subject of repeated investigations and the conclusions reached do not lack in variation. Of what value are all such investigations when the range of variation in individual plants is frequently greater than the difference in alkaloidal content attributed to different fertilizers or different climatic conditions? Until a type of plant is found which is at least fairly constant in the quality of alkaloids it produces, vital conclusions cannot be drawn from experiments such as those mentioned. The factor of individual variation must first be eliminated before the influence of environment can be definitely determined.

THE PREPARATION OF PURE SUCROSE AND DEXTROSE CAMELS.

GEORGE D. BEAL AND HARPER F. ZOLLER, URBANA, ILL.

The attention of the authors was first directed to the preparation of caramels by the failure of the qualitative tests for caramel in a number of liquids to which it had been added as a coloring agent. In order to study these reactions we set out to prepare pure caramel and observe its behavior. A review of the literature on the subject interested us in the composition of caramels, and it is on this account that we have studied carefully the preparation of the caramels in the purest condition.

The recent communications of Beringer and others have induced us to report our findings to this section in the hope that they may be of some assistance. In nearly all papers caramel has been considered as a mixture of the products of the action of heat on sugars. Prof. Beringer has recently given us a method for the preparation of a purified caramel based on the use of alcohol and sodium carbonate, the latter to dissolve any water insoluble products. In our method we have avoided the formation of this insoluble product by a shorter time of heating, rendering unnecessary the use of the alkali.

Caramel may be defined as an intermediate product in the decomposition of a carbohydrate by heat, and its composition varies according to the source. This will be taken up in a later paper, now in preparation. In addition to the caramel a large amount of vapor is formed, consisting in part of water, formalde-

hyde, acetaldehyde, benzalhyde, acetic acid, and carbon dioxide. This is in the particular case of sucrose caramel.

Caramel may be prepared in the laboratory by heating the desired sugar in a flask suspended in a heating bath at a temperature of 210° C. Personally, we prefer a bath of cottonseed oil, although we have used rape-seed oil, paraffin, sulphuric acid and Wood's metal.

Preparation. In our experiments we proceeded as follows: 100 gms. of granulated cane sugar or crystalized dextrose were placed in a 500 cc. Florence flask, suspended in an oil bath together with a thermometer and heat applied. When the temperature of the bath reached 210° C. it was maintained at that point for 30 minutes.

Sucrose begins to melt at 160° and between 180° and 190° it has a clear yellow color, being then in the form of barley sugar. As the temperature rises to 210° the mass begins to foam, rapidly darkening in color, giving off vapors rich in acetic acid and benzaldehyde.

Dextrose begins to melt at 140° . As the temperature reaches 180° it begins to froth and with the rise in temperature to 210° the color changes from grayish white through yellow to orange, then a golden brown and finally brownish black.

When caramelization was completed the flask was removed from the heating bath, partially cooled, then about 250 cc. of water added and the mixture allowed to stand until solution was complete. We found that by caramelizing in this manner no insoluble substance was formed. If a caramel flavor is desired this solution may be used.

Purification. The caramel solution thus obtained contained unchanged sugar and all the decomposition products not yet volatilized. If the solution be evaporated at this point, a sticky mass will be obtained.

There are three methods of purification, only one of which we have found to be satisfactory. Caramel is not as soluble in alcohol as in water, therefore a concentrated aqueous solution of caramel may be precipitated by pouring it into alcohol. This requires a comparatively large amount of alcohol, and to obtain a pure product requires several precipitations, since part of the sugar and probably some of the other decomposition products are precipitated with the caramel. For this reason the method is expensive and unwieldy.

Caramel is unfermentable, although some varieties of mould will grow upon it. If the caramel solution is kept at a temperature of 35° and some yeast added, the sugar may be fermented out in about three days time. To remove the yeast cells, it is necessary to filter the fermented solution through a Pasteur-Chamberlain filter or through a layer of infusorial earth on a filter paper in a Büchner funnel. The caramel prepared in this manner is extremely bitter and acid to the taste. The reason for this is that the fermentation removes only the sugar. Also, the caramel cannot be obtained in a dry condition free from stickiness.

We sought for a cheap and rapid method for freeing the caramel from all other decomposition products as well as from the sugar. Sabaneef and Zsigmondy both state that caramel passes very slowly through dialysis membranes. We found that membranes of either parchment paper or collodion might be used, diffusion through the collodion being more rapid. The preparation of collodion membranes for dialysis is described by one of us in another paper.

A membrane, prepared in a cylindrical beaker or an Erlenmeyer flask is about half filled with the caramel solution, a small glass tube tied into the neck, and the bag suspended in water, with the water and solution at the same level. The diffusion is allowed to continue for thirty-six hours, either in running water, or water which is changed frequently. A small amount of caramel passes through the membrane and is lost. The solution at the end of the dialysis is odorless, and has only a faint bitter taste. It has only a very slight reducing power which we believe to be due to the caramel itself.

The dialysed solution is then evaporated to a thick syrup and poured onto clean glass plates. When the film of caramel becomes dry, it may be scaled off. Working in this way, we obtain a yield of 15 percent of the original weight of sugar.

The caramel forms shiny, reddish- or brownish-black scales, perfectly dry and readily soluble in water or alcohol. Sucrose caramel is more intensely colored than dextrose caramel. The ratio of the color of solutions of the two caramels of the same concentrations is about ten to one. For this reason we recommend cane sugar as the source of caramel, although it is stated on good authority that by far the greater part of that on the market is made from glucose.

As stated above, the composition of caramel varies according to its source. We have found that the composition of each variety of caramel is constant in a number of preparations, by a determination of carbon and hydrogen in the caramels themselves and their benzoyl-derivatives, and determinations of their molecular weights.

SUMMARY.

Caramel is best prepared by heating cane sugar or glucose at 210° for thirty minutes. A somewhat higher yield is obtained by longer heating, but some insoluble matter is formed at the same time.

The best method of purification is found to be dialysis in a collodion membrane.

Sucrose caramel solutions are more densely colored than solutions of dextrose caramel of the same concentration.

All of this work is being continued and we hope to report progress from time to time.

CHEMICAL LABORATORY OF THE UNIVERSITY OF ILLINOIS, June, 1913.

A NEW FORM OF SEPARATORY FUNNEL FOR PREVENTING THE FORMATION OF EMULSIONS IN SHAKING OUT WITH IMMISCIBLE SOLVENTS.

CHARLES H. LA WALL, PH. M., PHILADELPHIA.

LaWall Separatory Funnel.

Many methods have been suggested for breaking emulsions when once formed and some few devices have been employed for preventing the formation of emulsions. While watching an extraction with hot chloroform in a Landseidl continuous extraction apparatus the idea occurred to me that if some form of separatory funnel could be constructed which would allow the liquids to pass each other in a thin layer without the necessity of agitation or even rotation the result would be satisfactorily achieved. Accordingly I had several separatory funnels made of a shape shown in the accompanying illustration.

The apparatus consists of two bulbs separated by a very small and short neck (not too small, however, as one was constructed in which the liquids were restrained from passing by the force of capillary attraction.) In one of these bulbs the liquid which is to be extracted is to be placed, adding sufficient water to completely fill the bulb. In the other the immiscible solvent which is to be used for the extraction is to be placed, almost completely filling the second bulb. By then inclining the bulbs at an angle, with the lighter of the two liquids in the lower bulb, the two liquids flow past each other in such a fine stream that almost complete extraction is easily accomplished by repeating the operation two or three times by inverting the funnel, after which the immiscible solvent may be drawn off and replaced by a fresh portion for the completion of the operation.

Such difficult operations as the extraction of mineral oil from a saponified vegetable oil dissolved in water can be readily accomplished without the least tendency on the part of the mixture to emulsify. Indeed, if used with ordinary care it would seem to be almost fool proof in this respect.

The use of this device makes possible the application of the assay process for alkaloidal fluidextracts suggested by me in a paper at the Boston A. Ph. A. meeting (J. A. Ph. A., Vol. 1, p. 39), without the difficulty of emulsification which was experienced by many who tried the method. Indeed, it was the search for

some such device which would make the process referred to more practical, that led to the construction of the form of apparatus described above, which I believe to be practical and to have a wide field of usefulness in the analytical and technical laboratory on either the small or large scale.

The bulbs may be made of any size convenient for the work to be accomplished.

NOTE ON THE PREPARATION OF COLLODION MEMBRANES FOR DIALYSIS.

GEO. D. BEAL, PH. D., URBANA, ILL.

The use of dialysis membranes of collodion is becoming fairly well known, but has been only occasionally mentioned in the literature. This note is intended merely to place the information where it will be available to the members of the Association, no originality whatever being claimed for it.

Membranes of parchment or parchment paper, while properly semi-permeable, require the use of an open vessel as a holder, or else form a very clumsy sort of a bag. The advantage of being able to prepare a dialysis cell of any desired shape or size will be apparent at once. This may be done with collodion, which has been prescribed for a long time as a cement for sealing the holes in a parchment membrane, without taking note of the fact that it could itself be formed into a flexible, semi-permeable membrane, possessing considerable strength.

A glass vessel of the desired shape and size is carefully cleaned with chromic acid cleaning mixture and thoroughly dried, after rinsing well with distilled water. It is best not to use alcohol or ether in the drying of the vessel. Twenty-five to 50 cc. of Collodion U. S. P. (according to the size) are poured in, and the vessel rotated while being inclined on its longitudinal axis, in order to secure an even coating on the entire inner surface, and finally the excess allowed to drain off, rotating continually. The inverted flask is rotated until the membrane is firm to the touch and the odor of ether is gone.

Run a knife blade around the rim of the vessel, to start the film loose, then place a glass tube, with rounded edges, in the mouth of the collodion membrane to permit the escape of air, and pour water between the collodion and the vessel to loosen the film, when it may be withdrawn. The bag should be tested for leakage by filling with water, and kept under water until it is to be used.

It is essential that the vessel be clean and dry, and that the collodion be of the U. S. P. variety. I have never been able to make a good bag from acetone collodion.

We have used these membranes successfully in the purification of caramel, the precipitation of certain proteins by dialysis, the preparation of colloidal hydrated manganese dioxide, and a number of other experiments. They are also being used in biological work, and seem to be generally available and easily prepared.

Section on Pharmacopœias and Formularies

Papers Presented at the Sixty-First Annual Convention

THE CAUSE OF ADULTERATED PREPARATIONS.

WALTER H. VARNUM, LAWRENCE, KANSAS.

In treating this subject it is my purpose merely to speak of some of the reasons for the lack of conformity to the standards of the Pharmacopœia in the preparations made by retail pharmacists, which condition unfortunately exists not because, I believe, that the majority of the druggists wilfully or maliciously adulterate their preparations, but because of other reasons of which I shall speak. The reason why I believe this, is because, First, I think most druggists are honest; Second, there are as many preparations found to be in excess of the standard strength as under, and Third, that the amount of manufacturing which the ordinary store undertakes would hardly make it worth while for the practice of dishonesty in lessening the strength of its preparations. To ascertain the reason for the lack of uniformity my first step was to inform myself as to the methods of manufacture in a number of stores, and in twenty-five stores of one of our largest cities I found the following to be the methods used to procure some of the U. S. P. preparations which they dispensed.

By dilution from fluidextracts.....	20
By following the Pharmacopœia.....	3
By purchase from wholesalers.....	2

Whether this same proportion would hold good all over the country it is of course impossible to say, but as these stores represent the conditions existing in one city, it may be assumed as a fair statement of general conditions, and when one stops to think that 80 percent of the druggists of the country do not make their pharmaceuticals by the U. S. P. processes, is it any wonder that there is need for Pure Food Inspectors?

Consider the ease with which unintentional mistakes can be made in the measurement of fluidextracts and the effect of such mistakes on the finished products, where a shortage of a few minims of the concentrated liquid means an appreciable difference in the product. This shortage may proceed from inaccurate measurement or from failure to rinse the graduate with the diluting fluid. For instance if 30 cc. are to be used in the manufacture of a preparation and 3 cc. are adherent to the graduate then there is a loss of ten percent in the strength of the finished product. It may be said that a person who is so careless as to allow these cc. of the fluidextract to fail of inclusion in the tincture would be careless in manufacturing by the U. S. P. processes, but if so a mistake of a few grains in his weighing will make no appreciable difference in the strength of the finished

product, and then too the mental training he will acquire by following out the specific directions of the U. S. P. will tend to make him careful in his work.

The catalogs and price-lists of glass manufacturers advertise graduates guaranteed to deliver certain specified quantities. I hope that no one here present is guilty of using these graduates and feels safe in so doing, for there is no graduate made that is capable of delivering an equal amount of all liquids that are measured in drug stores. The only way to secure accurate results would be to have a separate graduate for each liquid from chloroform down to balsams and heavy oils. But suppose that Mr. Druggist has a special graduate for the particular fluidextract that he is measuring—does that mean that it will deliver that quantity as he pours from it or must he let it drain carefully to get his required quantity? And, too, if he then rinses his graduate with his liquid is he going to get more of his concentrate and thus have a stronger preparation in his completed product? Such things tend to lack of uniformity in attaining the proper standards; furnish employment to pure food inspectors and encourage a lack of confidence in the druggist by physicians and laity. If I were going to use fluidextracts in the manufacture of preparations I would buy a pipette to use in measuring them, for only by using accurate measurements can one be sure of getting accurate results. The principle of using graduates guaranteed to deliver certain quantities is all right in theory but it is absolutely impossible to get a graduate which will deliver the goods. If there are any skeptical persons here that doubt this statement let him go home and test its truth by measuring from a guaranteed graduate 30 cc. each of chloroform and Balsam of Peru. Of two preparations, one made by the process of the Pharmacopœia and the other by diluting the fluidextract, there is but one that you can consistently mark as U. S. P.—the former. The other is made by an unofficial method and from a concentrate whose strength is vouched for by a manufacturer, but of which you have no other evidence. One you know to be true to standard, the other you hope will turn out so. Compare the appearances of preparations made by these two methods. They will be found to differ greatly and most of the tinctures made from fluidextracts will form a precipitate from the variances of the alcoholic strength of the diluting fluid from that used to prepare the fluidextract. Not long ago I was forced to prepare some Syrup of Wild Cherry from the fluidextract, the patient being in a hurry for the prescription which my stock of that syrup was insufficient to prepare. After I had prepared it I was ashamed to dispense the preparation, even in a prescription where the color would be somewhat disguised, for instead of the clear red syrup of the official process the product was a cloudy, dark brown syrup. There is much complaint by physicians on account of lack of uniformity in the appearance of standard pharmaceutical preparations, and if they should be supplied with a dark brown syrup of Wild Cherry instead of a clear red one, can you blame them for their just complaint? This was the first time I had ever used this method and it will be long before I do so again. The men who make the United States Pharmacopœia are as learned a group of men, both in the theory and practice of pharmacy, as can be found in the country, and they certainly would not require a busy pharmacist to waste his time in making preparations in the way directed by them, if the shorter way was "just as good."

In this day and age *speed* is the pass-word, but do not fool yourselves into believing that you are saving time and money when you are not getting the best results. The large manufacturers use the U. S. P. methods because they must conform to its standards; their goods must be able to stand government inspection and they must be sure that they are up to standard. As to the cost of manufacturing one's own preparations I have made two calculations, one including the time-cost, and the other excluding it. The first computation was made in order to fairly compare the cost with that of the manufacturing firms. The second was made for the reason that as the work was incidental to the other work of the store, it was thought best not to add the time-cost in figuring the net cost of the preparation. By the first method I find the actual saving to be from 10 percent to 25 percent, and by the second method the saving is from 25 percent to 50 percent. After making a preparation the next step is to test it to see that it is up to the standard required by the Pharmacopœia. I am afraid that the number of pharmacists who see the fine print underneath the directions for manufacture are very few indeed. I doubt if any druggist in the United States who makes his preparations from fluidextracts ever tests them after making. I am also doubtful as to whether there are many of those who make their preparations by U. S. P. methods who submit them to official tests. The fine print which follows the directions for making the preparations is just as important as the rest, if not more so. Nearly every druggist who uses the short method of manufacture has the same excuse to offer, viz., "This way is just as good and it saves a lot of time. I haven't the time to do it the other way." This may be so, but what does he keep registered men for, if not to do this work? If he has enough confidence in them to stand responsible for the prescriptions they prepare, he should have confidence in their ability to manufacture official preparations. This brings us to another question of importance, but which I will not discuss in this paper on account of lack of time. That is the graduation qualification for registration. While I believe it possible for a person to make a success in the drug business without a college training, yet in such a school he is trained in the pharmaceutical art, is made familiar with its literature, its implements and processes, and is taught to use his Pharmacopœia rightfully and usefully. There is of course a class of druggists in our profession which class is found in all lines of work—the incompetent. While this class do not maintain themselves in the drug business as long as in some other lines of work, many of them are in it long enough to bring discredit upon the profession. This class needs nothing more than a mere mention, as to waste time upon discussion of them would be useless and unprofitable.

We have therefore three classes of druggists that are responsible for the lack of uniformity in pharmaceutical preparations: First, the careless druggists who are the most numerous, and who can improve their methods if they will but try to do so; second, the "busy" (?) druggists who plead "lack of time," but who can be converted by being "shown"; third, the incompetent druggist, who will be out of business before he can be "shown" or taught. I hope that there is no one here that belongs to any of these classes, but should there be, it is time for him to change his ways and then if possible to be his "brother's keeper" and try to help him upward into the right path.

SUGGESTIONS ON QUALIFICATIONS TO TEACH IN COLLEGES OF PHARMACY.*

ALBERT SCHNEIDER, PH. D., SAN FRANCISCO.

I threatened to prepare a paper on the subject of Qualifications to Teach in Colleges of Pharmacy, but after I thought the matter over somewhat, I got cold feet. I feared that what I might say would not please everybody. As you know, it is practically impossible to please anybody; furthermore, I desire to have it clearly understood that the suggestions which I shall make are not to be taken in any way as personal, or directly applicable to any one institution, or to any one individual. There are simply a few general suggestions that I wish to submit, and if they are worthy of consideration, which I hope they are, they may result in some good.

By qualified teachers in colleges of pharmacy I have in mind the qualifications to have charge of the three departmental heads or divisions of the college of pharmacy, namely: Pharmacy, which is of first importance; second, Chemistry, and third, Pharmacognosy,—using this latter term in the sense that it is used in the California College of Pharmacy, as including general and special botany, and pharmacognosy proper, which includes a lecture course as well as laboratory work, bacteriology, human physiology, urinalysis, special micro-analysis, and such other work as is usually relegated to that division.

We may consider the qualifications to teach under two heads: First, inherited, and second, acquired. I am satisfied—based upon my observation and experience—that no individual, man or woman, should contemplate teaching unless he or she is keenly interested in such work, an interest which amounts to enthusiasm. That enthusiasm manifests itself very early in life, let us say at the age of five or six. You can readily pick out those who will probably make good teachers. The young man or young woman who has a keen ambition to excel along educational lines, has one important qualification to become a teacher. On the other hand, the individual who early in life expresses a predominant interest along commercial lines—who looks upon human activities in the light of the dollar sign—is not qualified, by inheritance, to become a teacher. It is true, we all desire to make a living, and in order to make a living we must interest ourselves in the dollar sign, more or less. Even a teacher in a college of pharmacy wants to live; he has a certain appreciation of the comforts of life; he would like to

*Delivered orally to the Joint Session of the Sections on Education and Legislation, the Conference of Pharmaceutical Faculties and the Association of Boards of Pharmacy.

provide for his family; he would like to send his children to school and give them the advantages of a progressive age. But there are certain reasons, to be mentioned later, which make the attainment of such desires practically impossible.

Next, after inherited qualifications, namely, the thirst for knowledge, comes the ability to convey information to others. This comes with training and experience. Temperamental qualifications are also very important. The individual who gets excited upon the slightest provocation and loses control of himself, is not fit to teach. Such an individual should select some other vocation. The one qualified to teach should be of even temperament, without being phlegmatic or indifferent, because an indifferent person cannot possibly encourage or produce enthusiasm in others. The teacher must have the power of enthusing the pupil in the work. Temperamental qualifications are also inherited. They cannot be taught, nor can they be greatly developed. They are born with the child.

Now, coming to the acquired qualifications: First, educational: It is simply a question of our conception of what constitutes an education. According to the present status of our educational system, it consists first of the grammar grades and inclusive of the high school. Every one who contemplates teaching, whether in the grades, in a college of pharmacy or in a university, certainly should have a high school training or its educational equivalent. Next comes the university and college work. According to the present educational standards and conditions, no man or woman is qualified to teach in a college who has merely had the courses of instruction as given in the college in which he or she contemplates to teach. He must have an educational acquisition wider and broader than that given by the college in which he desires to teach. That would mean he must have had more than the college course, or the university course. Some of this can be had in colleges of pharmacy, (the third—or fourth-year courses), in universities, in medical colleges, and in the higher institutions of learning. I do not wish to specify the particular degrees or diplomas which stand for such educational qualifications. Unfortunately, there are no educational institutions which prepare teachers for colleges of pharmacy; neither are there institutions that prepare especially to teach in colleges of medicine. We must simply utilize the educational facilities that are available.

So, therefore, to summarize: First, the inherited qualification referred to; secondly, the educational qualifications very briefly stated; namely, a university degree, say Bachelor of Science, or let us say Doctor of Philosophy. The teacher who contemplates taking charge of the work in the department of pharmacognosy, etc., should have specialized along botanical lines, as that is the only subject taught in a university which is more directly applicable.

So much in regard to the educational qualifications. The one who contemplates teaching pharmacy or chemistry should specialize along chemical lines, completing the regular or required courses in chemistry as taught in a university or some other higher institution of learning, plus some graduate work along chemical lines. The one to teach human physiology should have a course in physiology equivalent to that given in a first-class university of medical college, etc.

This is not all. I have merely outlined the foundation. These are not sufficient. The recent graduate from a university is not yet qualified to take charge

of a department in the college. He must have, in addition, a certain amount of experience. This he can get in many different ways and from many different sources. I believe it would be very desirable for the one who contemplates taking charge of pharmacy, to make a study of drug stores, the manner in which stores are conducted, the manner in which prescriptions are filled, etc. I should say he might get this experience largely as an observer. It would not be necessary for him to spend very much time as an apprentice in the store. It might be well for him to spend, let us say, two or three months as apprentice. The teacher of pharmacy, for example, should visit manufacturing institutions; should get employment, perhaps, for a time in some wholesale manufacturing concern. This would indeed give him very valuable experience. In addition to that, every teacher should be engaged in what is commonly designated as research work. The teacher who has no higher aim than to meet his classes and teach them the routine demanded by the college curriculum is not a satisfactory teacher. He should have sufficient enthusiasm and interest in his work to engage in special laboratory work, or something that stands for research work. That comes under the head of experience. Lastly, and probably most important of all, a teacher should have enthusiasm enough in his work to build up his department. Not merely teach the routine, not merely engage in research work, but *build up his department*. It should be his ambition to make his department the equal or the superior of any of its kind in any other college. He should keep fully abreast with the highest and best advance work in his special line.

I have said that it was not possible for a teacher, whether in a college or university, to enjoy the comforts of life or to provide for his family. This is only too true. The salaries paid are not sufficient. Let us hope that the time will soon come when competent instructors will be paid salaries high enough so that they may without reservation devote their whole time to the work. As it is, the best men are sooner or later compelled to abandon teaching for callings which will net them the absolutely necessary living income.

I believe this sums up what I had in mind as to what constitutes qualifications to teach in a college of pharmacy. It is true that we have instructors in some of our colleges of pharmacy who do not have these qualifications of inheritance, of education, and of temperament who are, nevertheless, eminently successful as teachers. As you know, it is the exceptions which prove the rules.

BUSINESS BUILDING.

Business building is a methodical operation. Put yourself in the customer's place sometimes. Go out, come into the store as if you were a customer and look around. How does the store look? Does it impress you favorably? Are things clean and bright? Is there a gang of loafers at the cigar counter swapping stories and keeping the ladies away? Ask yourself a few questions such as these. Many of us have opportunities that we cannot see. It is not enough to have opportunities. We must be able to see them; and, furthermore, it is well to be able to make them.—W. S. Adkins in *The National Druggist*.

METHOD OF HANDLING STRONGER AMMONIA WATER.

WM. R. WHITE, PH. C., NASHVILLE, TENN.

Perhaps there is no more difficult or aggravating task that the pharmacist comes in contact with than the handling of stronger ammonia water as it is ordinarily done in the drug store, by pouring it from one container into another. On account of the irritating and volatile properties of its gas the difficulty in handling it becomes a very grave proposition when it becomes necessary to transfer to small containers the contents of a tank which usually contains about 800 pounds.

Aside from the physical difficulty encountered in coming in contact with the fumes, the loss of strength incurred is a very important factor to consider. In order to obviate these difficulties as much as possible, the following method has been adopted, which is based on the principle of a syphon started by compressed air.

An iron compression tank with intake and outlet tubes, each having a stop-cock, is filled with air from an air pump operated by hand or by motor power until a pressure of about 20 pounds is obtained. Below the stop-cock on the outlet tube, fitted on with a union couple is a T joint, one end of which is closed by a stop-cock, the other end is threaded about $\frac{1}{4}$ " and is screwed into a threaded hole in the iron bung of the ammonia tank. This tube should not be flush with the inside of the bung, as the contact of it with the ammonia will color the ammonia. Another hole, unthreaded, is bored in the bung, and through it a glass tube is passed to the bottom of the ammonia tank, the top end of which is bent at a right angle, and connected with a rubber tube in which is fastened a pinch-cock. A mixture of hot rosin and wax is poured into the bung to make connections air-tight. In order to draw the ammonia, the outlet cock of the air reservoir is opened and the cock at the end of T joint is closed, the air enters the ammonia tank, with pressure, and causes the liquid to flow through the glass tube from the bottom through the rubber tube into container, when pinch-cock is released. The flow can be shut off by fastening down the pinch-cock. When all is drawn that is needed the cock on outlet tube of the compression tank is closed and the cock on T joint is opened, liberating the air in the ammonia tank, thus releasing pressure on syphon tube. Only a pound or two of pressure will be needed to draw ammonia from a full tank, but it will require about twenty pounds to empty it when low. By getting these holes bored in bungs of different

sizes, and keeping these on hand, tanks with various size bungs can be emptied when received. By this method the drawing of the ammonia is under complete control of the operator, with no risk of suffocation or loss of strength of ammonia gas.

This method is especially applicable to wholesale handlers of stronger ammonia water, but the same principle can be used when it is purchased on carboys, and a bicycle pump can be used to give pressure instead of having a reservoir of compressed air.

As this is a question that confronts every handler of ammonia water, the writer would like to hear this subject discussed by other members of this Association.

DISCUSSION.

Mr. F. W. Nitardy, of Denver, said he would like to state the way he handled ammonia water. He used a rubber tube as a siphon. In order to start the siphon, it was first filled with water, one end inserted in the carboy and the water in the siphon was drawn off into a graduate. He had never experienced any trouble in this. The method was very simple, and did not require anything but a piece of rubber tubing.

A NEW AND SATISFACTORY FORMULA FOR LIQUOR ANTISEPTICUS.

CHARLES H. LA WALL, PH. M., PHILADELPHIA.

The pharmacopœial formula for Liquor Antisepticus has been frequently criticized and justly so, for being a harsh and unpleasant preparation. Solutions of this type should be pleasant and fragrant, as they form valuable adjuncts to the toilet. A formula which is the result of numerous experiments made by a generous user of such preparations and which has been modified from time to time to correct slight deficiencies, is herewith presented as being satisfactory to a larger number of persons than any other similar solution with which the author has had any experience:

Eucalyptol	5.0 Cc.
Methyl salicylate	1.2 Cc.
Oil thyme, white.....	0.3 Cc.
Thymol	1.0 Gm.
Menthol	1.0 Gm.
Sodium salicylate	1.2 Gm.
Sodium benzoate	6.0 Gm.
Boric acid	25.0 Gm.
Fluidextract golden seal.....	2.0 Cc.
Alcohol	300.0 Cc.
Water q. s. to make.....	1000.0 Cc.

Make the solution according to the art of the pharmacist, reserving 60 cc. of the alcohol to add to the clear filtrate.

Kieselguhr or talc may be used as a filtering medium.

A NEW AND SATISFACTORY FORMULA FOR LIQUOR ANTI-SEPTICUS ALKALINUS.

CHARLES H. LA WALL, PH. M., PHILADELPHIA.

The National Formulary preparation bearing this title is unnecessarily high in solids and in alkalinity. The following formula is offered as one which has been well tested and meets all the requirements of such a solution:

Sodium bicarbonate	5.0 Gm.
Sodium benzoate	10.0 Gm.
Sodium salicylate	10.0 Gm.
Sodium borate	30.0 Gm.
Thymol	0.2 Gm.
Menthol	0.2 Gm.
Eucalyptol	0.2 Cc.
Methyl salicylate	0.2 Cc.
Alcohol	40.0 Cc.
Glycerin	150.0 Cc.
Water q. s. to make.....	1000.0 Cc.

This solution should be made according to the art of the apothecary and if it is desired to color the solution red, as is frequently done, cudbear may be used for this purpose; or if it is desired to employ a more resistant color, one which will not bleach out so quickly when the colored solution is dispensed with hydrogen dioxide solution, the color known as vegetable red, used by confectioners and bakers, which is a sulphonated orcin, may be used.

SUPPLYING THE PHYSICIAN.

The typical M. D. seems to think that every purchase he makes from a supply house saves him just that much money. He regards the druggist as a middle man for whose existence there is no excuse as far as he is concerned. He forgets that the supply house is itself a middle man source of supply, that it is rarely an original manufacturer of high-class specialties. He forgets, too, that there is a limit of price below which certain goods cannot be sold. Supply houses cannot keep underpricing one another and the druggist indefinitely without ultimately reaching the bottom. If he were to investigate he would find that supply house qualities are just about on a level with supply house prices. But it is a condition, not a theory, that confronts the druggist. The physicians do buy from the supply houses, and they will continue to do so unless they are sold by some one else. If you want to sell them, instead of sitting back and complaining or wishing, you will have to take off your coat and go after the business as those competing houses do.—*The Spatula*.

Papers Presented at the Sixty-First Annual Convention

"THE ART OF MAKING A SALE."*

ADDRESS OF BEN R. VARDAMAN, DES MOINES, IA.

Gentlemen, I realize it means a great deal for you to be here, at the cost of considerable time and money, that you may come and mingle for a week with your fellow businessmen, and "absorb ideas from one another," as one gentleman has said. I often think when I see men in a convention of this kind that, after all, it is the ideas that we take home that are the all important factors. As I look into your faces, I realize that there is not a man here who is not sitting beside a man that knows just a little more about some particular phase of his business than he himself knows. You cannot be here without taking some ideas home and applying them in your business.

The subject assigned to me this evening is a broad one, "The Art of Making a Sale." We are all engaged in business for the purpose of making sales. And yet, as you well realize, if you have given the thing any thought, the art of making a sale is possibly the subject that is given the least attention in your business. While this is naturally true while you are gathered here in your annual convention, I maintain that it is thoroughly true in your business. I know it is true in the business of the average business man today, strange as it may seem. His business depends on his making sales, and yet it is not given a great deal of thought, as a rule, in his business.

We sometimes become confused in our terms. For instance, I have experimented a great deal, and have asked men to give me a definition of the term "business." It is pretty hard for the average man to do that—to give a concrete definition of the term "business"—"commerce." If I should ask you to do that to-night, the general consensus of opinion would be that "my particular business is just a sort of routine grind." The merchant says, "It means going to work at 7 o'clock in the morning, opening the door, and serving the public all day long." The banker says, "It means going to my bank and serving the public and handling money all day long." Yet, when we think of the term "commerce," how few of us think of ourselves as important elements? We think of the great steamship and railroad systems—the great movement of traffic in the country. We eliminate ourselves. So to-night, in discussing the broad subject of the art of making a sale, I want to eliminate everything else from it, and talk to you for just a little while about the personal element—yourself, and those associated with you, in the act of making sales in your business.

I am going to be brief to-night, because I know you are uncomfortable here in

*Printed from the stenographer's report.

this room, and I am not going to say as many things in the way of general introduction as I might say under other circumstances. I want to try to help you in your own particular line of business. Yet I do not know that I am going to say very much about the drug business. You have that three hundred and sixty-five days in the year. I want to talk to you about the great fundamental principles that lie underneath and about your business. We realize that the business world to-day rests upon the primary wants of humanity. Our whole commercial system rests upon the primary wants of the people. The gathering of sustenance, of food and raiment, is after all, the great problem of modern commerce. Your problem is to learn how to supply that demand, and see that the world gets what it wants.

I am going to talk to you about the art and science of salesmanship. I have heard you gentlemen speak about the Scientific Department of your Association. I have heard some exceedingly interesting papers read here this afternoon on various scientific subjects; and to-night I am speaking to an audience of men not afraid to turn to science. Sometimes I talk to audiences that do not thoroughly appreciate the term "science," because they have not had it drilled into them as you gentlemen have in your particular line of business. I wonder how many of you that have thought of the scientific department of your business realize that the term "scientific department" should cover the selling end of your business, just as it does any other part or phase of your business. A great many say it is impossible to apply it in the selling end of their business. But it is, however, possible to apply it to salesmanship.

Sometime ago I was talking to a retail hardware merchant, and he said, "There is something wrong about my business, and I want you to go through it and see what it is." I spent three hours doing that, and, in examining his stock, I asked him many questions. I said to him at the end, "You have no science in your business; that is all that is the matter with you." He says, "I can't understand your term. I have heard so much about it. It is impossible for me to see how you can apply that term in the hardware business." He said he had a boy in the high school who had been studying science for two years, and he didn't know enough to fly a kite. I said, "He is perhaps trying to fly it with incomplete and piecemeal knowledge." Then I gave him Herbert Spencer's definition of science: "Science is nothing more nor less than thoroughly organized and classified knowledge." To-night, I am sure you gentlemen cannot think of a thing more valuable in your business than thoroughly organized knowledge of your business.

Another illustration: There are several colleges in this city, and some man is designated as Professor of Mathematics in these colleges. That means that he has studied the organized knowledge and science of the subject of mathematics, until he is able to go to the blackboard with a piece of chalk and demonstrate a very complicated problem, so that you can readily grasp and understand it. He is a mathematician, we say, because he understands the great science of mathematics.

To give another illustration: You gentlemen in your business come in contact sometimes with a young man who wants to become a doctor. The law says to him, "You must first attend a medical school and make a study of the organized

science and practice of medicine. You must go into the dissecting-room and take the human system and tear it to pieces, and carefully study it, and analyze every bone and muscle and tendon and artery, and every tissue in the system." After he has gone through this course of study, and passes his examinations, he is granted a certificate, and is given authority to practice medicine. You call in that man when you are sick, and he looks at your tongue, feels your pulse, and asks you a few questions. He has studied the organized knowledge of that subject, the science of it, just as you gentlemen have studied the science of pharmacy. But how far have you studied the science of salesmanship, of business, the thing on which your business depends? It is just as important to have knowledge on the selling end of your business as it is on the chemicals that you supply. The only trouble is, that you have not had your attention drawn to the requirement of knowledge of that kind.

I was going down the street one day and met a real estate salesman, and I said to him, "How did you happen to sell that house and lot on the corner down there?" His reply was, "I hardly know what you mean. A man came into the office and said he wanted to buy a house, and I told him about the size of this house and its location, and said to him, 'That is the house you want,' and he went over there and looked it over, and the price and everything suited him, and he came back and paid for the property, and the deed was made out to him. It was all very simple." I said to him: "But I want you to tell me how to reach the heart-strings of the people that I come in contact with, so that I can create in them the desire for the property that I have for sale. If you cannot do that, you do not thoroughly understand the great science and art of selling real estate."

I was sitting in the office of the president of a large insurance company once, and a man came in and said, "I have made up my mind to take that policy of \$5,000 we have been talking about." I said to him, "How did you do that? It looks like an easy way to make money." He reached into a desk and pulled out a blank and said, "There is the best policy of insurance that is written in the world, and all any one has to do is to find a man that wants insurance, and he takes that policy." I said, "But I am afraid I would starve to death finding people that want insurance. I want to know how to touch the heart-strings of people, to create the desire to take out insurance. If you can't tell me how to do that, you don't understand the great art and science of selling life insurance."

Again, I go into a clothing store across the street and say to the clerk, "Show me how to sell a suit. Show me how it is you lay hold of people and create a desire for the goods you have to sell." And sometimes I wonder if in your own particular business, where you have seen your clerk make a mistake, you have ever called him to the back end of your store, and explained to him what he should have done to appeal to the customer.

There is an art and science in the sale of goods. We fail, sometimes, to go to the bottom of these things. But we have reached that point in our business development—and it is obvious more and more every day—where it is up to the retail merchant to study the organized knowledge of his business, or he is going to have a harder time to exist than he has ever had. A great many merchants to-day are having a hard time to exist. Up to the first of July, over five thousand had gone out of business. And I notice the reports of the rating agencies say

that the great reason for this was incompetency in business. Incompetency! I want to say to you gentlemen that that is a horrible indictment against the methods, the policy of to-day, in the retail world. Incompetency is nothing more nor less than a lack of organized knowledge of the particular business. There is a science and a great art in your business.

I find a great many people who do not appreciate this fact, but who are trying to exist in their business by the "tricks of the trade." Sometime ago, in the city of Detroit, I was talking on this same subject before a great convention. Several hundred men, gathered from all over the country, were assembled there, and I saw a great streamer placed across the lobby of the Cadillac Hotel. The pennant said that I was going to show some of the tricks of selling. I went to the secretary and asked him to take it down. I said, "I am not going to talk about 'tricks,' and I don't want a single man to think that I am going to talk about 'the tricks of the trade.'" I hope there is not a man in all this great convention that is existing in his business because of low-down tricks. I would rather see him exist because of the application of great principles in his business. But sometimes, in some lines of business, I find men resorting to tricks.

A little while ago I was in a shoe store and was talking with the merchant. He carried a stock of \$90,000. I saw that man perform a trick, and make a sale. A woman came into the store, leading a little boy. The boy wanted a pair of hunting-boots. Now, you know there is no such thing as hunting-boots coming from the factories of the country, made for little boys. The little fellow had seen his father wearing hunting-boots, and he wanted a pair, a pair of high-topped boots, water-proof, with viscolized soles, and all that. The merchant knew there was no such thing. The tired mother said she had been to every store in the city, and couldn't find any hunting-boots for the boy. He said to the little boy, "Why, certainly, I can find you a pair, little man." Then he went back to the rear of the store to get a boot that he knew was not there. He brought out the nearest thing to it that the manufacturers made, which was a man's size No. 7 boot. He told the little boy to try them on and he did, but, of course, they were very much too large for him. Then he went back to the rear of the store to get a smaller boot, and put a pair of big felt insoles into it, and brought it back, and still it was too large. The third time he went back to the rear of the store, and put into that boot another heavy felt insole, and had the little boy try that. He stamped his foot and said, "There, Mister, that is all right! That fits me." Then he slipped three soles in the other boot, and let that little boy put those men's boots on, and go stalking up the street with them. After the lady had gone, and he had turned and dropped \$7 into the till, he turned to me and said, "You have got to get the money some way." That poor man believed that he had to get the money "by hook or crook." But I tell you that that man performed a trick when he made that sale, and he made it because he was a moral coward. He didn't know enough about the art and science of his business to sell that little fellow the kind of boot he ought to wear. I was in the store three weeks afterwards, and I asked him if the lady had come back, and he said, "Yes, she came back." He knew when that boy went home with those great, big, heavy boots, that she would come again when she found she

had been wronged; and she brought the boots back, and he lost a customer. He thought he was doing business by that "trick."

Now, some of you are saying: "What is the difference between the science and the trick?" The trick always deceives your customer's mind. By science, you lead and persuade the mind.

I might illustrate this by two common little examples, things that you see every day. Possibly it is done in your own work, I don't know—and maybe you don't know. Possibly you have stepped into a store, and said to the clerk, an unsophisticated young fellow, that has probably not been there very long, "I want 10 cents worth of chocolate creams." The clerk fills the sack and puts it on the scale. Then he stands there and takes out one cream after another and puts them back in the case, and you see that going on until you become convinced that that clerk is a miserable thief, and is taking your chocolates. You will never buy another thing at that store. Then you remember, on your way home, that your wife told you to bring a dollar's worth of sugar home. So you go into old "Uncle Billy" Skinner's and say, "I want a dollar's worth of sugar." Uncle Billy goes behind the counter, and puts a lot of sugar in a bag and puts it on the scales, and he hasn't got enough; then he begins to dip up sugar and put it in the bag, and goes after more sugar, and yet more sugar, until after a while, you begin to wonder if he is going to compel you to carry that whole barrel of sugar home for a dollar. You take it home, and you put it on your scales, and you discover it is a pound short in weight. But no human power could make you say that "Uncle Billy" was a robber, because he had touched a chord that responded just exactly the way he wanted it to respond, while the clerk had touched that same chord, but he had touched it at the other end. One touched it in a positive way and the other in a negative way.

When you have analyzed and come to a thorough understanding of these two little examples, you will have solved the great art and science of salesmanship. It is a simple problem. It is not a vague and mysterious thing. There are only three very common elements in it. But let me impress one thought here:

You gentlemen are here to consider the making of sales. Do not think that there is no connection between the goods you have on your counters and shelves to sell and this idea. The art of making a sale is a great mental problem. I step into a store and say to a salesman, "How many sales have you made to-day?" Nine times out of ten he will pull out his cash register and begin to count his tickets; or perhaps reach for his sales book and say, "Here are the sales I have made to-day." Or maybe he will begin to count the money in the till. I say, "Oh, no, I want to know something about the sales you have made. These things are not the sales. You don't make sales in the cash-drawer, or in the sales-book, or the cash-register, or anything of that kind. They are only the record of your sales."

You make your sales in the minds of your customers. Get that thought and take it home with you, and drive it home to your clerk that when he is making a sale he is dealing with a mental problem. You have never made a sale but that your customer's mind has passed through a certain series or stages of evolutions. I might name quite a number of these stages. For instance, you cannot possibly make a sale without leading a man from what we call the first stage,

that of introduction, to the stage of attention, the stage of interest, the stage of desire, the stage of resolve. You cannot possibly make a sale where your customer's mind does not go through these stages. Sometimes it is done very rapidly, and sometimes it may take a week, or years, to lead a man from one stage to another. Just make a study of the things that go to make up a sale, and see if you cannot detect in your customer's face the workings of his mind.

I want to say to you that there are just three prime elements in the accomplishment of that feat, and they are: First, yourself; second, the thing you have for sale, and third, the other person. That is all there is to it—a very simple problem. Yet no man has studied that problem thoroughly enough to go to the bottom of it. As I look in your faces I know I have before me the most important part of these elements—yourselves; your own individual personality. And yet I say, without the slightest hesitancy, that although this is the principal phase of your business, it is the part you have given the least thought to.

It has been my privilege, during the last fifteen years, to come in contact with practically every leading educational institution in this country, and I have studied their young men. I have made a practical study of the young men in the universities of the country, and I have asked them what they were being taught, regarding their own individuality—themselves, their magnetism, their own personality; and, without one single exception, they have replied that they were not being taught these things in these institutions. I have asked that question everywhere, and have gotten the same answer. I have asked what their parents and guardians were doing regarding the development of their personality, their own individual personal magnetism, and out of a splendid list of a thousand names just three have told me that they had received such instruction. And so I do not hesitate to say that the most important element of all in business, that of individual personality, is the subject that is being given the least thought in our education of to-day.

If I were to advise a young man going out into business to-day, I could not do better than to give the advice given to a class of graduates in a law school by an old, white-haired judge who had taught them. The old man, feeble and infirm, said to them, "Young men, as you go out now into your chosen profession, I want to suggest that when you have found a place that suits you, you should tack your shingle on your office, and look at it from up the street and down the street, and across the street, and find out how it looks to other people." In other words, the first thing for the young man to do, in embarking on his chosen profession, is to learn how he looks in the eyes of the community; how he looks in the eyes of the people upon whom he must depend for his livelihood. And I believe it will be a good thing, when you gentlemen go home, for you to go behind your counters and ask yourselves honestly, "How do I look in the eyes of my community?" Then address yourselves to your clerks and salespeople, and get them to ask, "How do we look to the people about us?" Personality! It is a power, and you know how it radiates. The personality I refer to is not so much the personality we see as that we feel. As I look into your faces to-night, the thing that impresses me the most is not your size or splendid proportions, but that something that comes from inside of your head. I am not going

to talk about the subject of the power of mind over matter—nothing of the kind. But, after all, it is the things that you are thinking that impress people first of all.

If I had the time, I would experiment a little to-night. I would ask some of you business men, and three or four of you who could smile, to come and sit here and smile at this audience while I am talking. You could see the effect and how it would lift you up. Then I would ask them to hold that smile while they thought of the meanest thing they could possibly think of. Not one of them could do it. If you think you can do it, just try it before your mirror, in the privacy of your own room. You will find that just the moment you permit your mind to change from the pleasant thought that induced that smile, and begin to think of low, mean things, that smile will fade. I don't mean a grin. I mean a smile that comes from the very soul of a man; the thing that everybody likes; the thing that you are going to give your customer, when you try to lead and persuade and control that man; the thing you should inspire in your clerks.

As soon as you go home from this convention, try this thing of smiling when you meet your customers, your home people, and just try to see how good you can make them feel, and see how easy it is to sell them, and to bring back trade.

I stopped into a lawyer's office in Detroit, once, and he was out, and I sat down to wait for him. Over his desk was that old motto that reads, "Smile; damn you, Smile!" I wondered why he had that sign up there, and when he came in I asked him, and he said, "Simply to make people smile." He said, "A man comes into the office, and he feels that he is being persecuted. He sits down at the desk and he sees that sign, and he begins to smile, and I know he is being lifted up; then I can help him."

But I must hurry along.

There is another invaluable quality in personality especially, that the salesman loses sight of, and that is memory. Somebody will say, "Can people see my memory?" No, but they can feel it. Several years ago I was in Chicago, and I needed some shirts, some tailor-made shirts, and coming down Dearborn street I saw a little sign that read, "Cobb makes shirts." I said, "If Cobb makes shirts, we ought to get together, because I need shirts." I went in and gave the order, and a little man came from behind the counter, a dapper little gentleman, and he put out his hand and said, "My name is Cobb; I am glad to meet you." Two years later I was in Chicago again, and it occurred to me that I needed some more shirts, and I naturally went back to Cobb. Cobb came in, and reached out his hand, with a big smile on his face, and said, "Why, Mr. Vardaman, how do you do? I am glad to see you." I held his hand and said, "I want you to tell me how you did that." He said it was a part of his business. Yet, it was a magnetic part of his business. I liked that—liked to be remembered; and so do you, and so does everybody. How he reached out there and picked my face out of all the thousands he had seen pass his store in that time, and stuck my name to it, was a marvelous thing to me.

You say you cannot do that. Yes, you have your own memory just as great and powerful as Cobb's was; the only trouble is, that you haven't developed it along that line. You know where all the thousands of articles in your store are; you have that memory, because you have developed that side of it. You can develop your memory just as readily as you can develop the muscles of your

arm; and if you do it, the people about you will pay for it. When people come into your store, and you are able to call them—men, women and children—by their names, and call to mind some little incident that occurred three or four years ago; that is going to draw them to you. It is invaluable, this quality of personal magnetism. There is not a man in this audience to-night, under the age of thirty-five, who cannot broaden his shoulders half an inch, or increase his height half an inch, by applying some of the scientific principles we have been talking about here to-night.

And you men of maturer years, I want to ask you what you have been doing with your clerks, or your salesmen, by way of training them to see things in their business—teaching them to use their eyes. We sometimes think that our eyes are placed in our heads to view the beauties of nature; but I want to tell you that the man who can use his eyes in the right way can bring beads of perspiration onto the brow of the attorney who tries to confuse him on the witness stand. When you have learned how to use your eyes, you can make a sale all right.

An old lawyer said to me once, "I have been practicing at the bar for forty-two years. I would give almost my right arm if I knew how to shake hands with people. Whenever I wish to shake hands with the jury and thank them for their services, I feel my weakness." The politicians know how to do that, as we all know.

But I might continue here for an hour on the subject of your personality. I simply want to say that if you and your salesman will take up some line of that sort and develop it to the fullest degree, the world about you will pay you handsomely in "the coin of the realm."

Now, the second great element in the art of selling is to know what you have to sell. I am only going to touch on that to-night. We all know that the salesman should be an expert adviser in his business, and he cannot be an expert adviser unless he knows the thing he is advising the customer about.

Out in Denver a few days ago I stepped into a store—a drug store—I don't know whether the proprietor is here or not—and I saw a clerk trying to sell a customer a pair of military brushes. The clerk pulled out the drawer and picked up two or three brushes and the customer picked up one particular brush, and was looking at it; he was in a hurry, and he wanted some brushes quickly. He remarked that he had come from home without his brushes, and he had to buy some; and he said to the clerk: "Is this a genuine ebony brush, or is it just a pine board painted black?" The clerk said, "I really don't know, but I imagine it is ebony, from the price." That man went out without buying. These things are happening every day. How long would it have taken that clerk to learn whether that brush was ebony or a pine board painted black? That proprietor could have taken that boy into the back of the store, and, in thirty minutes, have taught him all about his brushes.

I have a shaving brush that I gave 25 cents for. A few days ago I stepped into a store with the idea of buying a "rubber-set" brush, and I asked the clerk what a rubber-set brush was, and he said it was just some way of sticking the bristles in. I asked him what was the difference between a 25-cent brush that

he showed me and a rubber-set brush. His reply was, "I don't know that there is much difference." I said, "I will take the 25-cent brush."

Now, here is a watch (exhibiting same) that I bought several years ago, and paid \$40 for, because the man who sold it to me knew watches. I have always been proud of that watch. And here is the point!—sometimes people say, "Yes, it is a pretty smooth game to sell your customer." But when you know the goods, you can lead your customer to appreciate them before he buys. And I want to say to you that I have carried this watch all these years, because I think so much of it. He put one of those jeweler's magnifying glasses over one of my eyes, and he told me to shut the other eye and look into that watch, while he called my attention to its small spring, and he said, "That one spring in there is worth \$7,500,000 a ton. Then he said, "Those little red objects that you see are ruby jewels." That sounded rich, and I looked with interest. He showed me the whole interior of the watch. Everything else was obscured from me, except what he wanted me to see in it. And all the while he was pouring into my ears just what he wanted me to hear. I was dead to the world, for the time being. I bought the watch. I was afraid he was going to take it away from me. That sale came from the knowledge of how to sell goods.

One time I stepped into a store where a man was trying to sell oranges. He said, "I have bought this pile of oranges, I have tried to sell them, and I can't do it." He was advertising big California oranges at 29 cents a dozen. I said to the man, "Do you really want to sell these oranges?" He said, "I certainly do," and he told me how many cases he had. I said, "This is a big California orange, and nearly everybody knows that, and you are advertising that." They were really large, fine oranges. I asked him what kind of oranges people liked, and he said they liked big oranges. I said, "Do they like juicy oranges? Do they like sweet oranges? Can't you just advertise juicy, sweet oranges? Just say that in your advertisement, and see if the people don't begin to flock in here." He told me afterwards he hadn't lost a single case of oranges; he had sold them all out, by knowing his goods. A man cannot be an expert adviser and not know his goods.

The third great prime element in making sales is to know the people about you. Take the people in your town, and you will discover that the most successful business men, as a rule, are those who know most about sizing up people—who know most about human nature; just the commonplace things about the people we are having to deal with every day. When we have learned what is in the lives of people, it is easy to appeal to them.

But we sometimes have a very erroneous idea of this thing we call human nature; very often the nature of people about us is largely what we make it. That is hard to believe, but there is a great deal of truth in it. Say, for instance, that I come into your town, and decide to buy and made my home there. I go down the street and meet you, and say to you, "I am considering buying this house over here, and I would like to know about the man next door." You say, "To be real honest with you, that man is not the sort of man I would like to be next-door neighbor to." I thank you, and go on farther down the street and meet another citizen, and he says, "I have known that man for twenty-five years,

and I think as much of him as any man in this town." What is the difference? It is largely in what the different individuals have attributed to that man.

I wish I had more time to elaborate upon twenty-five or thirty characteristics of human nature to-night. But I have not the time, and you have not the time to listen to me. I will cut it down to three or four fundamental elements of human nature that the salesman should serve.

The first is, that you cannot drive a man. I mean that you can't argue a man into a thing, but you can lead him. These are universal characteristics, because we find them among people everywhere.

Another is this: People are lazy; and if you are wise, you will cater to that laziness. What I mean is, that people naturally have a desire to go against as little resistance as possible. They move along the lines of least resistance. Yesterday, in coming through Chicago, I went up State street, and stood where I could study the architecture of the great entrance to the Marshall Field store.

That is a wonderful piece of architecture; it is noted the world over. And in studying that, and allowing my eyes to follow the great pillars down from top to bottom, I wondered if the architect had not made a mistake when he placed these pillars there, and forgot to put the threshold in. I felt like going to the manager of that great store and saying to him that the architect had made a mistake in failing to put the threshold there. But had I done so, he would have replied that it had been left out by express direction; that they had told the architect to make it just as easy as possible for people to enter the store—in fact, so easy that they would just fall in. They recognize this principle of human nature.

One time I was in Rochester, Minnesota, and wanted a little 10-cent bottle of perfume, and I went into a drug store to get it. The clerk stood in the back of the store. I walked in 10 or 15 feet and stopped, but he didn't notice me; he was reading the base-ball news or a scandal or something. I stood there for possibly thirty seconds, and then started for the door. He then asked, "Is there something you want?" I said, "No, thank you," and went on out. Down the street a few doors I went into another drug store, where a bright, snappy fellow came up. He knew I wanted something, and he asked, "What can I do for you?" I was about a minute buying that bottle of perfume and paying for it. If I was there to-night I would go in and buy another bottle of perfume, just to see the enthusiasm of that salesman. He made it easy to buy that bottle of perfume; while the other fellow made it so hard I couldn't do business with him. Make it as easy as possible for people to do business with you. People will pay you for it. It is no small part of making a sale.

Another thing for you to remember is, that people are proud and selfish. Every mortal likes "taffy," if you will give it to him the right way. I know a lady who has charge of the family affairs and purchases, because the husband is too busy to give his attention to them. She has some boys, and the salesman where she buys their clothes knows her pride in them. She walks into the store with one of these boys and says to her favorite clerk, "I guess George will have to have a new suit." So he leads George back, selects a coat and slips it on him, leads him over by the mirror, adjusts it so that he can see both front and back, then casually walks over to the mother, turns around and says, "I want to tell you, Mrs.

Blank, there is a son for any mother to be proud of." She is pleased, and she pays the price, just to hear the clerk say these things.

I know an old German merchant in a little town in Iowa who has built up a wonderful business by knowing how to play on some of these characteristics of human nature. He has a stick of candy for every child that comes into the store, and he makes it a point to personally see that each child gets a stick of candy; and it matters not how untidy or unkempt a baby may be, he never permits a mother to come into the store that he does not take up that baby and fondle it, and tell the mother, "How much it looks like papa!" They come to him for fifteen or twenty miles just to hear these little compliments. People like it. Give it to them, and see how easy it is to make sales.

The last point I want to make on this subject of human nature is, that normal men and women are subject to that great thing we call "suggestion." I am not talking about hypnotism, but I want to touch on the fundamental principle of hypnotism. Over here in New York City is a doctor who has given up the practice of medicine, because he has developed that quality to such a marked degree that he can use it for surgical operations where the patient has weak heart action and cannot take an anæsthetic. He tells him that it won't hurt him to undergo the operation, and he tells it to him so emphatically that the man can undergo the operation without serious pain.

I sometimes tell a joke on my wife that illustrates this idea of suggestion. We were coming down the street one cold afternoon, and she was breaking-in a pair of new shoes, with heavy, stiff soles, and her feet got cold. I wanted a particular magazine, and I suggested that we go into a drug store on the corner, and she could warm her feet by the register while I was picking out of the rack the magazine I wanted. She agreed, and we went in, she stood over the register until I finally got through. Then I asked her if she was ready to go, and she said, "Yes," and we started. About that time a clerk came up and said, "I am awfully sorry, lady, but that old furnace of ours has been out of order, and we have not been able to have any heat in it." There was something in the power of suggestion that warmed her feet.

Another time, away out in western Missouri, on a cold, blustery day, twenty-four people besides myself were in a little hot, stuffy station, waiting for a train. Somebody asked when the train was due, and the agent said in about thirty minutes. I thought I would try a little suggestion on the crowd, and accordingly I suddenly reached for my watch, looked at it, snapped it shut, grabbed my grip and hurried out of the station. Every man in that station did the same thing. They thought somebody had said the train was coming around the bend. I pulled up my overcoat collar and went to walking up and down the platform, and they went back feeling sold.

Now, I said I was going to talk to you, in the main, in terms that we could all understand, that I was not going to talk on the art and science of salesmanship in technical terms. But I want to say that, fundamentally, suggestion is possible simply because every normal individual has two mental functions grinding away in his mind all the time. Great and wise scientists tell us that is not true; but, nevertheless, there are certain actions or phases of the mind we are unable to account for on any other hypothesis, except that we have two mental

functions. We call one of these our objective mind, and the other part we call the subjective mind—because it is subject to our objective mind, and that of others, too. I have never found a better illustration of these two qualities than was given me one time in early life by my old father. One rainy day on the farm we were in the barn, and I noticed a stray cat come in, a poor, scrawny, miserable, bobtailed cat; and I asked my father why a bob-tailed cat was always poor. He said there was a good reason for it; that if I would watch a cat creep up on a mouse, I would see that the mouse watched the cat's tail as it lashed back and forth, and the closer the cat got to the mouse, the more furiously the tail lashed; and the mouse watched the cat's tail so closely that it failed to notice the nearer approach of the cat's mouth and claws, until it was too late for him to escape. Of course, he said, a bob-tailed cat was "handicapped." He had no way of taking advantage of the subjective mind of the mouse. And so the salesman must know how to get behind the subjective mind of the customer.

But how are we going to apply these great fundamental principles we have been talking about here. Suppose you are a grocer, and it is along late in the spring, about the time that apples are ready to spoil and become covered with little black specks; and Mrs. Jones comes into the store, and sees a basket of these apples, and says, "Mr. Smith, are these apples the best you have?" What are you going to say? You know they are the best you have, and the best in the market at the time. There are a great many things you might say. But you have a mental problem to solve: it is a mental problem you have to deal with, pure and simple. People have to accept what you tell them, just so long as they haven't a logical reason for disbelieving. Mark that; it is worth a great deal. All right; what are you going to say to her? You may say, "Yes, these are the best I have." She may reply to that, "If they are, they are certainly mighty poor apples." You may say, "Yes, they are the best in the market at this time of the year." She might think it was a mighty poor time to buy apples. But reach down into the basket and pick up one of these apples, split it open, and show her how nice and juicy and white it is, and say to her, "They are the finest apples in the world for cooking." She has never cooked them, and she is compelled, by that great law of nature, to believe that thing. It is her subjective mind. Here is what happens in that mind. It goes back from your store over to her home, into the dining-room there, and sees the big cut-glass bowl there full of juicy apples. She will buy that basket of apples and take it home, and come back and tell you you told the truth. How long would it take you to argue that woman's objective mind into buying apples about to spoil? But you can lead her past that, through her subjective mind, and she will buy them.

Here is another illustration: A customer went into a gentleman's furnishing store to buy a night-shirt. The clerk was new and didn't understand the stock, but he placed a box on the counter and pulled out a shirt with a big red border around the front. The customer smiled and said, "I don't want anything like that; I just want a neat, plain garment." So the clerk turned to the proprietor and said, "What have we in the way of plain night-shirts?" The proprietor replied, "Nothing, they are all coming that way now." The customer was about to leave, when the clerk said, "wait a minute"; and he reached into the box and pulled out a night-shirt identically like the other, but this one he turned over on

the counter. He knew human nature. He knew that a man likes a big, full, roomy, generous garment, and he showed him how long it was, and how broad it was across the shoulders. Now, you will remember, that I said a while ago, if you know how to use your eyes, and make others use their eyes you can accomplish a great deal. He had that man with his eyes down close to that shirt, following a neatly pointed pencil to see the fine stitching of the garment. Finally the customer said, "I believe that is about the garment I am looking for," and he asked the price of it. The clerk said \$1.50. Now, that shirt had that same red border, but the clerk had led him past that. How long would it have taken him to argue that man into the feeling that he wanted to buy a night-shirt with a big red border across the front? He couldn't drive him, but he could lead him past it.

I saw two Italian boys once crying: "Pineapples for sale at seven cents each, or three for a quarter." I thought it was a pity they didn't know how to count money. I sat and watched them make ten sales, and saw seven business men go up and buy pine-apples at three for a quarter, instead of paying seven cents apiece for them, and realized that the boys did know the value of money.

I saw a patent-medicine man one time—one of these fellows you are passing legislation against right along—use this principle on a farmer. He drove up to the farmer's house, and the farmer listened to his story: but he replied, "No, we don't want any more medicine; the whole cupboard is full, out in the kitchen now." Apparently the salesman didn't hear that. He just reached over and tapped this farmer on the knee, and said, "I want you to use one bottle of this, but don't quit using it after two or three days just because it makes you feel so much better!" The old man went down in his pocket for the dollar.

I laughed at a friend of mine some time ago. A druggist was advertising a certain famous medicine—the kind of medicine that, if you are sick, makes you feel so much better; and this man, a great, big, strong, robust fellow, was appealed to by that advertisement, and, with some embarrassment, he went into the drug store and said, "I see you advertise a medicine that makes a sick man feel better, and I wondered if it would make me feel better." That is part of the suggestion.

But sometimes we lose sight of another important factor in suggestion. Sometimes a young man will go into a store, and say, "I reckon you don't want to hire any more clerks in here, do you?" You don't hire him. But this is not half as laughable as to see a great big business man using that kind of negative suggestion in his business right along. I stepped into a big clothing store one day, and saw a man trying to buy a shirt. He said he wanted to buy a fine dress shirt. The proprietor showed him a shirt, and said the price was \$4, and the customer was admiring it. Then the proprietor said to him, "Neighbor, there is one of the greatest pieces of junk I ever sold in my life." That customer immediately saw the old rag man coming down the alley, crying "Rags; old iron!"—that is "junk." He came out of there in a hurry. A few weeks later I saw a notice in the paper that that man's business was in the hands of a receiver. He didn't understand the art of making a sale.

I stepped into a furniture store one time, to buy a folding go-cart for the baby, and the clerk showed me a nice little cart, and persuaded me it was the cart I

wanted. But he wanted to say something more, and he wheeled it across the floor and said, "There is a little cart that has given us the *least trouble* of any we have ever handled." Trouble! I didn't want trouble, I wanted something to wheel the baby in. I expect he wonders to this day why I got out of there. I went down the street to another furniture store, and asked to see a go-cart—and I have always thought that cart was exactly like the one I saw in the first store. The clerk wheeled it up and down, and showed me its strong points, and finally gave it a shove across the floor, and said, "There is a great cart. That cart has given us the greatest satisfaction of any cart we have ever handled in this store." Satisfaction! That is it—satisfaction. I bought that cart, and I have it yet.

Over in Ohio, a gentleman in a jobbing business of some sort told me about this power of suggestion. He said that on every box they shipped out was a tag stating that the article in it was fully guaranteed, and telling the customer if he didn't find it absolutely all right in every respect they would take it back. He said they had 85 percent of such articles brought back—a kick of some kind. A little, scrawny, insignificant man, he said, came in one day, and was nosing around among the boxes, and he said, "What have you got that tag on there for?" He replied, "To make our customers feel better." The little man said, "Take it off." They took them off, and found out that less than 5 percent of the packages they sent out brought back a complaint.

I want to leave this thought with you, that in the art of making a sale you can cause people to see the things you want them to see. I don't want you to understand that you should have any salesman to tell anything but the truth. You cannot build up a permanent business in that way. But the man who properly understands his own nature, the nature of the people about him and the nature of the goods he has to sell, and knows how to apply that great fundamental thing called "suggestion," can make people see the things he wants them to see.

A shoe merchant told me once, "You have given me a thought, and I am going to try it. I have been in business eighteen years, and I have been guaranteeing my goods, and customers have been coming back and complaining about the goods I sell them. I believe I can see why. All these years I have instructed my salesmen that they should impress upon the customer's mind that our shoes were absolutely guaranteed." I said, "Change that, and say something positive about the shoe—that it is "a splendid wearing shoe," or "a neat looking shoe," or, "You will find that an exceedingly comfortable shoe." A year or so later I saw that man again, and he said, "I want to tell you that little change in policy has worked wonders in my business. I very seldom receive a complaint, because people are not looking for things to complain of. They are looking for positive qualities." Apply that in your business.

As I leave this subject with you to-night, I want to lift you up, as I said before, clear out of your business, and make you appreciate the fact that you are dealing with fundamental principles. Do not think that the principles I have been talking about are not applicable to your business, so long as you are dealing with humanity.

A young man in Detroit killed an old woman, snatched her diamond ear rings from her and her rings from her fingers, slipped back across the river and

baffled the police and detectives. After a few weeks, this young man became bold, and said he knew something about that "murder mystery." He was arrested and placed in a cell; whereupon he sent for a public stenographer and dictated the minute details of the horrible crime. He had no money to employ counsel, and one of the great criminal attorneys of that city was appointed to defend him. When he was called upon to plead, in spite of his confession, his attorney arose and said to the court, "Our plea is not guilty." The case was tried before a jury, the young man all through the trial contending that he had killed the woman; the jury was charged, and in two hours there was a rap on the door and the jury was led in, and to the despair and disgust of the court and all the law-abiding citizens of that city, their verdict was, "We find the defendant not guilty." Why? Simply because that great attorney knew some laws that were greater than the laws of the State of Michigan. He knew some of the fundamental laws of human nature. He knew how to say to these men, "Percy didn't commit this crime." These men went out and returned, I believe, a conscientious verdict, because this man knew the power of that great element in human nature—suggestion. I cite this instance to show the extent to which study can develop this insight into human nature.

One time in Chicago a great evangelist was preaching to thousands. One morning a number of representatives of the Associated Press called on him, and interviewed him on his marvelous power over men. They expected him to button his coat up and say, "Gentlemen, that power is simply a manifestation of the great Divine power." But Gypsy Smith said nothing of the kind. He said, "The secret of my power over men is in knowing how to appeal to them. I have studied men. When I see a man in trouble in the audience, I know how to touch him, I know how to appeal to him." So I say to you, if you study the people about you,—as that great lawyer did, and as that great evangelist did,—you will experience a great revival in your business.

But I want to impress upon your minds that your whole problem in any sale is a mental problem. The three great fundamental elements in it are yourself, the goods you have for sale, the people about you; and don't forget that the one great single element is the *man* element.

UNITED STATES PHARMACOPŒIA.

NINTH REVISION.

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS.

Copyright, 1914, by the Board of Trustees of the United States Pharmacopœial Convention.*
All Rights Reserved

PART III—FIRST PROOF.

A third installment of the Abstract of proposed new descriptions and standards and of changes in descriptions and standards is herewith submitted.

This Abstract embraces most of the Waters, Solutions, Spirits, Extracts, Fluid-extracts, Resins, Tinctures and Miscellaneous Galenicals. Where no reference is made to rubrics, formulas, directions, tests or chemical assays, it is understood that the material facts remain the same as in the United States Pharmacopœia, Eighth Revision. In galenical preparations the requirements for alkaloidal content and the proximate assay methods are not included; these will be published later.

Other Abstracts will be submitted later. Comments should be sent to the Chairman of the Revision Committee, Joseph P. Remington, 1832 Pine Street, Philadelphia, before June 1, 1914.

WATERS.

Aqua Aromaticæ.—General process added calling for 2 Cc. of Volatile Oil in 1000 Cc. of Aromatic Water and 15 Gm. of Purified Talc. Purified Siliceous Earth (Kieselguhr) is added to the alternative distributing and filtering media. Recently boiled distilled water is directed. Aromatic Water should not be allowed to freeze.

Aqua.—"Without odor or taste" changed to "practically tasteless and odorless." Odorless when heated nearly to boiling and agitated. Solids limited to 0.03 Gm. in 100 Cc., changed from "0.05 Gm. in 100 Cc." Tests replacing "heavy metal test": Add 1 Cc. of hydrochloric acid to 100 Cc. of Water and then introduce 50 Cc. of hydrogen sulphide T. S. It should show no darkening after standing fifteen minutes (metals). Add 1 Cc. of hydrochloric acid to 100 Cc. of Water and then introduce 1 Cc. of potassium ferrocyanide T. S.; no blue coloration should be produced immediately (iron). New test for limit of chloride: Add 0.5 Cc. of tenth-normal silver nitrate V. S. to 200 Cc. of Water. Filter and add to the filtrate 3 drops of potassium chromate T. S.; a permanent red precipitate should be produced. Modified test for nitrites: Add 1 drop of

*Permission to reprint for purposes of comment can be had on application to the Chairman of the Board of Trustees, J. H. Beal, Scio, Ohio.

hydrochloric acid, 1 Cc. of sulphanilic acid T. S. and 1 Cc. of naphthylamine acetate T. S. to 100 Cc. of Water in a Nessler jar, stirring with a glass rod after each addition. Closely cover the jar with a glass plate and place it upon a white surface and view it from above; no pink coloration should appear within five minutes. Modified test for nitrates: Add 1 Cc. of sodium carbonate T. S. to 100 Cc. of Water and evaporate the liquid in a small porcelain dish just to dryness. Moisten the residue thoroughly with 2 Cc. of phenol-sulphonic acid T. S., gently warm the dish, then add 20 Cc. of ammonia water and sufficient distilled water to measure 100 Cc. Any yellow color produced should not be greater than that obtained by evaporating 0.0021 Gm. of potassium nitrate, dissolved in 3 Cc. of distilled water and 1 Cc. of sodium carbonate T. S. to dryness and treating the residue in the same manner as the residue from the Water; the comparison of colors must be made in Nessler jars of the same diameter and size. In tests for ammonium compounds add 2 Cc. of reagent to 50 Cc. of Water and observe through a Nessler jar.

Aqua Ammonia.—Rubric changed from "10 percent." to "not less than 9.5 percent. nor more than 10.5 percent., by weight, of ammonia." Specific gravity changed from "0.958" to "about 0.958" at 25° C. "Completely volatilized at 100° C." changed to "not more than 0.005 Gm. of residue from 25 Cc. of Ammonia Water when evaporated in a platinum dish at 120° C."

Aqua Ammonia Fortior.—Rubric changed from "28 percent." to "not less than 27 percent. nor more than 29 percent. by weight, of ammonia." Specific gravity changed from "0.897" to "about 0.897" at 25° C.

Aqua Amygdalæ Amaræ.—Recently boiled distilled water directed.

Aqua Anisi.—Recently boiled distilled water directed.

Aqua Aurantii Florum.—Must comply with description and tests under *Aqua Aurantii Florum Fortior*. Dilute with recently boiled distilled water.

Aqua Aurantii Florum Fortior.—Added requirement: It should be free from empyreuma, mustiness and mucilaginous growths. Added test: It should be neutral or show only a slightly acid reaction with litmus and should leave no residue on evaporation.

Aqua Camphoræ.—Recently boiled distilled water directed.

Aqua Chloroformi.—Recently boiled distilled water directed.

Aqua Cinnamomi.—Recently boiled distilled water directed.

Aqua Creosoti.—Recently boiled distilled water directed.

Aqua Destillata.—Amount of distillate collected changed from 800 volumes to 750 volumes. Any other kind of distillatory apparatus may be used if the water complies with the tests given. "Neutral to litmus" changed to "neutral to indicators" (see page —). Heavy metal test replaced by the requirement that 100 Cc. portions should show no alteration on the addition of hydrogen sulphide T. S. or ammonium sulphide T. S. New ammonia test: "Distilled water should show no marked brown coloration when 1 Cc. of Nessler's reagent is added to 100 Cc. of the water. Residue when evaporated to dryness on a water-bath changed from "0.005 Gm. from 100 Cc." to "0.001 Gm. from 100 Cc." In test for

oxidizable substances the requirement that the color should not wholly disappear after ten hours is omitted.

Aqua Destillata Sterilisata.—Freshly Distilled Water, a sufficient quantity. Transfer the necessary quantity of freshly Distilled Water to a flask of hard-glass, of sufficient size, which has previously been cleansed and sterilized as described in paragraph No. 1 under Sterilization. Close the mouth of the flask with a pledget of sterilized purified cotton, boil the contents vigorously for 30 minutes and allow it to cool without removing the cotton plug. Finally protect the mouth of the flask and the cotton pledget from infection with dust by wrapping it in sterilized paper. Sterilized Distilled Water should be used within 48 hours after its preparation wherever practicable.

Aqua Fœniculi.—Recently boiled distilled water directed.

Aqua Menthæ Piperitæ.—Recently boiled distilled water directed.

Aqua Menthæ Viridis.—Recently boiled distilled water directed.

Aqua Rosæ.—Must comply with description and tests given under *Aqua Rosæ Fortior*. Dilute with recently boiled distilled water.

Aqua Rosæ Fortior.—Added requirement: It should be free from mustiness and mucilaginous growths. Added test: It should be neutral or show only a slightly acid reaction with litmus and should leave no residue on evaporation.

SPIRITS.

Spiritus Aetheris.—No change.

Spiritus Aetheris Nitrosi.—Rubric changed from "not less than 4 percent." to "not less than 3.5 percent. nor more than 4 percent. of ethyl nitrite."

Spiritus Ammonia Aromaticus.—No change.

Spiritus Amygdalæ Amaræ.—No change.

Spiritus Anisi.—No change.

Spiritus Aurantii Compositus.—No change.

Spiritus Camphoræ.—No change in formula and directions. Assay will be reported later.

Spiritus Chloroformi.—No change.

Spiritus Cinnamomi.—No change.

Spiritus Gaultheriæ.—No change.

Spiritus Glycerylis Nitratis.—Rubric changed from "1 percent. by weight" to "not less than 1 percent. nor more than 1.1 percent. by weight of Glyceryl Trinitrate. Added test: On heating about 10 Cc. of Spirit of Nitroglycerin on a water-bath with 1 Cc. of potassium hydroxide T. S. until the alcohol is evaporated, and then heating a portion of the residue with about 0.5 Gm. of potassium bisulphate, the pungent odor of acrolein will be evolved. On dissolving the remainder of the residue in 2 Cc. of distilled water acidulated with diluted sulphuric acid, then adding a few drops of diphenylamine T. S. and pouring the solution upon 2 Cc. of sulphuric acid in a test-tube so as to form a separate layer, a dark blue color will be produced at the zone of contact. Modified test: On

mixing 10 Cc. of the Spirit with 11 Cc. of distilled water, both previously cooled to 15° C., the mixture should be slightly opalescent. On adding 1 Cc. more of distilled water, a distinct turbidity should be produced. Assay: Weigh accurately not more than about 5 Cc. of the Spirit, allow it to evaporate spontaneously in a tared dish protected from dust, and dry the residue to a constant weight in a desiccator. The weight obtained should correspond to not less than 1 percent. nor more than 1.1 percent. of glyceryl trinitrate. Statement requiring rejection if specific gravity be above 0.830 or if 10 Cc. be rendered turbid by less than 10 Cc. of water is omitted.

Spiritus Juniperi.—No change.

Spiritus Juniperi Compositus.—No change.

Spiritus Lavandulae.—No change.

Spiritus Menthae Piperitæ and Spiritus Menthae Viridis.—Modified directions: Macerate the Peppermint leaves (and respectively the Spearmint leaves), freed as much as possible from stems, during one hour, in 500 Cc. of water and then strongly express them. Add the macerated leaves to the alcoholic solution of the oil, macerate the mixture during six hours, with frequent agitation, and then immediately filter it. Store the product in amber-colored bottles.

SOLUTIONS.

Liquor Acidi Arsenosi.—Rubric changed from "Arsenous Acid corresponding to 1 percent. of arsenic trioxide" to "Arsenous Acid corresponding to not less than 0.975 percent. nor more than 1.025 percent. of arsenic trioxide." Specific gravity added: "About 1.025 at 25° C."

Liquor Ammonii Acetatis.—Specific gravity added: "About 1.018 at 25° C." "Wholly volatile" changed to "volatile; not more than 0.01 percent. of ash remaining on ignition." Assay added: Weigh accurately about 25 Gm. of Solution of Ammonium Acetate, dilute it with 100 Cc. of distilled water and transfer it to a distilling flask fitted with a safety tube. Render it alkaline with potassium hydroxide T. S. and subject the liquid to distillation until no more ammonia is evolved. The distillate should be received under the surface of 50 Cc. of normal sulphuric acid V. S. contained in a flask. The residual titration with normal potassium hydroxide V. S., using methyl-orange T. S. as indicator, should show not less than 7 percent. of ammonium acetate.

Liquor Arseni et Hydrargyri Iodidi.—Rubric changed from "not less than 1 percent. of Arsenous Iodide and 1 percent. of Mercuric Iodide" to "not less than 0.95 percent. nor more than 1.05 percent. of Arsenous Iodide and not less than 0.95 percent. nor more than 1.05 percent. of Red Mercuric Iodide." Added tests: One Cc. of Solution of Arsenous and Mercuric Iodides, mixed with 10 Cc. of distilled water and to which a few drops of lead acetate T. S. is added, should produce a bright yellow precipitate. Add a few drops of Solution of Arsenous and Mercuric Iodides to a mixture of 0.1 Gm. of zinc and 5 Cc. of diluted hydrochloric acid in a test-tube, and cover the mouth of the test-tube with a filter paper which has been moistened with mercuric chloride T. S. and dried. A yellow colored stain should appear within one minute upon the inner surface of the filter paper. Assays: Weigh accurately about 25 Gm. of Solution of

Arsenous and Mercuric Iodides, mix it with 2 Gm. of sodium bicarbonate and titrate the solution with tenth-normal iodine V. S., using starch T. S. as indicator. It should show not less than 0.95 percent. nor more than 1.05 percent. of Arsenous Iodide. Weigh accurately about 25 Gm. of Solution of Arsenous and Mercuric Iodides, mix it with 5 Cc. of potassium hydroxide T. S. and 5 Cc. of solution of formaldehyde in a flask, and place the mixture upon a water-bath until the mercuric salt has been completely reduced to metallic mercury. Carefully decant the clear, supernatant liquid from the residue of metallic mercury and wash the mercury carefully by decantation, with two successive portions of 25 Cc. each of distilled water. Convert the residue of metallic mercury into mercuric nitrate by the action of 5 Cc. of nitric acid and dilute the solution with 50 Cc. of distilled water. The subsequent titration with tenth-normal potassium sulphocyanate V. S. to the formation of a permanent pink color, should show not less than 0.95 percent. nor more than 1.05 percent. of Red Mercuric Iodide.

Liquor Calcis.—In the process the magma is to be washed with boiling distilled water until the washings show not more than a faint cloudiness with AgNO_3 T. S. Lime Water should be frequently prepared from fresh magma of Calcium Hydroxide and not made by shaking up the sediment with a fresh portion of Distilled Water, unless the product be assayed and found to be of full strength. Requirement that it should conform to the tests under Calx omitted.

Liquor Chlori Compositus.—Rubric changed from "about 0.4 percent. of Chlorine with some oxides of chlorine" to "a mixture of chlorine and chlorine oxides equivalent to at least 0.35 Gm. of chlorine in each 100 Cc. of the solution." Added tests: Compound Solution of Chlorine when evaporated to dryness on a water-bath leaves a white residue of potassium chloride. Add 1 Gm. of potassium iodide to 25 Cc. of Compound Solution of Chlorine in a flask. The subsequent titration with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator, should show not less than 0.35 Gm. of available chlorine in each 100 Cc.

Liquor Cresolis Compositus.—Cresol, 500 Gm.; Linseed Oil, 300 Gm.; Potassium Hydroxide, 80 Gm.; Alcohol, 30 Cc.; Water, a sufficient quantity to make 1000 Gm. Add the Potassium Hydroxide dissolved in 50 Cc. of water to the Linseed Oil, both at 70° C. Incorporate the Alcohol and heat the mixture without stirring until soluble in boiling water; while yet warm add the Cresol, heat at 70° C. until clear and add water to make 1000 Gm.

Liquor Ferri Chloridi.—Test for "absence of salts of the fixed alkalies" changed to "residue on evaporation not more than 0.10 percent." Assay: Weigh accurately about 2 Gm. of Solution of Ferric Chloride, dilute it with distilled water to a volume of about 25 Cc. and mix it with 5 Cc. of hydrochloric acid and about 3 Gm. of potassium iodide. Allow the mixture to stand for 30 minutes at a temperature of 40° C., cool, and then dilute with 100 Cc. of distilled water. The titration of this solution with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator, should show not less than 10 percent. of iron.

Liquor Ferri et Ammonii Acetatis.—Added tests: Acid reaction with litmus. Specific gravity about 1.0385. The solution yields a blue precipitate with potassium ferrocyanide T. S.; ammonia water produces no precipitate. When

Solution of Iron and Ammonium Acetate is heated with potassium hydroxide T. S., ammonia is evolved. On adding 1 Cc. each of sulphuric acid and alcohol to 5 Cc. of the Solution and boiling the mixture, ethyl acetate will be formed, recognizable by its odor.

Liquor Ferri Subsulphatis.—Rubric changed from 13.57 percent. to 13.50 percent. of metallic iron. The test showing "difference from tersulphate" omitted.

Liquor Ferri Tersulphatis.—The test showing "difference from subsulphate" is omitted.

Liquor Formaldehydi.—From 7 to 14 percent. of methyl alcohol added to prevent polymerization. Specific gravity changed from "1.075 to 1.078" to "from 1.070 to 1.095 at 25° C." On evaporating 20 Cc. of Solution of Formaldehyde to dryness on a water-bath, a white, amorphous mass (paraformaldehyde) should remain, and upon igniting this residue the yield of ash should not exceed 0.05 percent. (fixed impurities). Changed from "no residue on evaporation and ignition" to "ash not exceeding 0.05 percent." Test for formic and other acids changed from "absence of not more than 0.1 percent." to "not more than 0.2 percent." Tests for chloride, sulphate, iron, lead, copper and calcium replaced by "ten Cc. of an aqueous dilution of the solution (1 in 20) slightly acidulated with hydrochloric acid should not respond to the test for heavy metals." In assay allow the mixture to stand for thirty minutes instead of ten minutes before titrating back with normal H_2SO_4 V. S.

Liquor Hydrogenii Dioxidi.—(Aqua Hydrogenii Dioxidi, U. S. P. VIII.) Add to rubric: Acetanilide may be used to prevent deterioration and pressure in this solution in an amount not exceeding 0.4 Gm. to each 1000 Cc. Solution of Hydrogen Dioxide in which acetanilide has been used as a preservative sometimes acquires a yellow color or an odor of nitrobenzol. If either of these conditions is noticed the solution should not be dispensed for medicinal purposes. Free acid test replaced by the following: On titrating 25 Cc. of Solution of Hydrogen Dioxide with tenth-normal potassium hydroxide V. S., not more than 2.0 Cc. of volumetric solution should be required to effect neutralization, phenolphthalein T. S. being used as indicator (free acid). Modified tests: Evaporate 50 Cc. of the Solution, previously rendered alkaline by the addition of sodium hydroxide T. S., to dryness on a water-bath and transfer the dry residue to a platinum crucible. Moisten the residue with sulphuric acid, cover the crucible with a watch-glass, the converse side of which is coated with a thin layer of yellow wax and afterwards scratched so as to expose the glass and then cooled by placing water in the concave side and standing in this a small beaker which must be kept filled with cold water. Now heat the crucible and contents in a water-bath for one hour; the surface of the watch-glass after being cleaned should exhibit no sign of corrosion (hydrofluoric acid). On evaporating 1 Cc. of the solution to dryness on a water-bath and dissolving the residue in 10 Cc. of distilled water containing 1 Cc. of diluted hydrochloric acid, the liquid should not respond to the test for heavy metals. Added tests: Add 4 drops of sodium acetate T. S. to 10 Cc. of the solution and follow with 4 drops of calcium chloride T. S. No turbidity or precipitate should be produced within 10 minutes (oxalic acid). Subject 100 Cc. of Solution of Hydrogen Dioxide to the shaking-out process with

two portions of 25 Cc. each of chloroform and evaporate the chloroformic solution to dryness at room temperature in a tared glass dish. A crystalline residue may be obtained which should not weigh more than 0.040 Gm. and which, upon heating with 1 Cc. of sodium hydroxide T. S. and 2 drops of chloroform, will evolve the disagreeable odor of phenyl-isocyanide (presence and limit of acetanilide).

Liquor Iodi Compositus.—Rubric changed from “not less than 5 percent. of iodine and 10 percent. of potassium iodide” to “not less than 4.75 percent. nor more than 5.25 percent. of iodine, and not less than 9.5 percent. nor more than 10.5 percent. of potassium iodide.” Added tests: A drop of Compound Solution of Iodine when added to 1 Cc. of starch T. S., diluted with 10 Cc. of water, produces a deep blue color. Assays: Weigh accurately about 10 Gm. of Compound Solution of Iodine, evaporate it in a tared, porcelain dish on a water-bath, and gently heat the residue over a Bunsen burner. It should leave a residue of not less than 9.5 percent. nor more than 10.5 percent. of a salt corresponding to the identity tests for potassium iodide given under Potassii Iodidum. Weigh accurately about 10 Gm. of Compound Solution of Iodine, dilute it with 25 Cc. of distilled water and titrate with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator. It should show not less than 4.75 percent. nor more than 5.25 percent. of Iodine.

Liquor Magnesia Citratis.—Magnesium Carbonate, 15.0 Gm.; Citric Acid, 33.0 Gm.; Syrup, 60.0 Cc.; Purified Talc, 5.0 Gm.; Oil of Lemon, 0.1 Cc.; Potassium Bicarbonate, 2.5 Gm.; Water, a sufficient quantity. Dissolve the Citric Acid in 150 Cc. of hot water in a porcelain dish, and, having added the Magnesium Carbonate previously mixed with 100 Cc. of water, stir until it is dissolved. Then add the Syrup, heat the mixed liquids to the boiling point, immediately introduce the Oil of Lemon, previously triturated with the Purified Talc, and filter the mixture, while hot, into a strong bottle (previously rinsed with boiling water) of the capacity of about 300 Cc. Introduce enough boiled water to nearly fill the bottle, stopper it with purified cotton until cold, then drop in the Potassium Bicarbonate, and immediately stopper the bottle securely. Lastly, shake the solution occasionally, until the Potassium Bicarbonate is dissolved. Keep the bottle on its side in a cool place, preferably in an ice chest.

Liquor Plumbi Subacetatis.—Change in assay: Warm the clear acidified liquid to 80° C. before titrating with normal potassium permanganate V. S. Reference to tests under Plumbi Acetas omitted. Added tests: Solution of Lead Subacetate, diluted with 10 parts of recently boiled distilled water, yields a black precipitate with hydrogen sulphide T. S., a yellow precipitate with potassium iodide T. S., and a white precipitate with diluted sulphuric acid. Solution of Lead Subacetate should yield with potassium ferrocyanide T. S. a precipitate which should not be perceptibly blue and red (limit of iron and copper).

Liquor Plumbi Subacetatis Dilutus.—No change.

Liquor Potassii Arsenitis.—Rubric changed from “Potassium Arsenite corresponding in amount to 1 percent.” to “Potassium Arsenite corresponding in amount to not less than 0.975 percent. and not more than 1.025 percent. of arsenic trioxide.” Added tests: It shows an alkaline reaction with litmus. On acidulating 4 Cc. of Solution of Potassium Arsenite with nitric acid and adding 1 Cc.

of silver nitrate T. S., a yellow precipitate should be produced free from red or reddish-brown color (arsenate).

Liquor Potassii Citratis.—An aqueous solution containing not less than 8 percent. of anhydrous Potassium Citrate ($K_3C_6H_5O_7=306.34$) (corresponding to about 8.5 percent. of the hydrated salt), with small amounts of citric and carbonic acids. Potassium Bicarbonate, 8 Gm.; Citric Acid, 6 Gm.; Distilled Water, a sufficient quantity to make one hundred cubic centimeters. Dissolve the Potassium Bicarbonate and the Citric Acid, each, in forty cubic centimeters of Distilled Water. Filter the solutions separately, and wash the filters with enough Distilled Water to obtain in each case fifty cubic centimeters. Finally, mix the two solutions, and, when effervescence has nearly ceased, transfer the liquid to a bottle. This preparation should be freshly made when wanted. Modified assay: Weigh accurately about 15 Gm. of Solution of Potassium Citrate, evaporate it to dryness in a platinum vessel, then thoroughly carbonize the residue at a temperature not exceeding red heat, transfer the vessel and its contents to a beaker, and boil them for thirty minutes with a mixture of 50 Cc. of half-normal sulphuric acid V. S. and 50 Cc. of distilled water. Then filter the mixture, wash the residue with hot distilled water until the washings cease to affect litmus, cool the filtrate and subject the washings to residual titration with half-normal potassium hydroxide T. S. It should show not less than 8 percent. of anhydrous Potassium Citrate, methyl-orange T. S. being used as indicator..

Liquor Potassii Hydroxidi.—Rubric changed from "containing about 5 percent.," to "containing not less than 4.5 percent. of Potassium Hydroxide." Instructions for using Potassium Hydroxide of other than official strength omitted. Specific gravity, about 1.046 at 25° C. Added test: Weigh accurately about 20 Gm. of Solution of Potassium Hydroxide and titrate it directly with normal hydrochloric acid V. S., using methyl-orange T. S. as indicator. It should show not more than 5.5 percent. of alkalinity, calculated as potassium hydroxide (limit of carbonate). Modified assay: Weigh accurately about 50 Gm. of Solution of Potassium Hydroxide, transfer it to a 250 Cc. graduated flask, add 20 Cc. of barium chloride T. S. and fill the flask to the mark with distilled water, which has previously been boiled and cooled. Then thoroughly agitate the liquid, pass it through a filter which has not been previously moistened (rejecting the first 20 Cc.) and titrate 100 Cc. of the filtrate with normal hydrochloric acid V. S., using phenolphthalein T. S. as indicator. It should show not less than 4.5 percent. of Potassium Hydroxide, when calculated to the amount of Solution originally taken.

Liquor Sodæ Chlorinata.—Rubric changed from "containing at least 2.4 percent." to "containing at least 2.5 percent. by weight of available chlorine." Modified formula: Monohydrated Sodium Carbonate, 70 Gm.; Chlorinated Lime, 100 Gm.; Water, a sufficient quantity to make 1000 Gm. Triturate the Chlorinated Lime with five hundred cubic centimeters of water gradually added until a uniform mixture results. Dissolve the Monohydrated Sodium Carbonate in five hundred cubic centimeters of hot water, and add this solution to the previously obtained magma in a suitable vessel. Stir or shake the mixture thoroughly, and if it becomes gelatinous warm the vessel very gently until it again liquefies. Then

transfer the mixture to a wetted muslin strainer returning the first portion until the liquid passes through clear and when no more liquid drains from it, wash the precipitate with enough water to make the product weigh one thousand grammes. Specific gravity omitted. Modified assay: Weigh accurately about 7 Gm. of Solution of Chlorinated Soda in a flask, mix it with 50 Cc. of distilled water and add 1 Gm. of potassium iodide and 5 Cc. of acetic acid. The subsequent titration with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator, should show not less than 2.5 percent. of available chlorine.

Liquor Sodii Arsenatis.—Rubric changed from "not less than 1 percent." to "not less than 0.975 nor more than 1.025 percent. of anhydrous Sodium Arsenate." The Exsiccated Sodium Arsenate must be dried to constant weight at 150° C. before weighing. Add to assay: Weigh accurately about 30 Cc. of Solution of Sodium Arsenate, heat the solution to 80° C. and add 10 Cc. of hydrochloric acid and 3 Gm. of potassium iodide. Allow the mixture to stand for 15 minutes at 80° C., cool the mixture and then titrate it with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator. It should show not less than 0.95 percent. nor more than 1.00 percent. of anhydrous Sodium Arsenate.

Liquor Sodii Chloridi Physiologicus.—Sodium Chloride, 8.5 Gm.; Distilled Water, a sufficient quantity to make 1000 Cc. Dissolve the Sodium Chloride in sufficient freshly Distilled Water to measure 1000 Cc. and filter. Then sterilize the filtered solution of Sodium Chloride, preferably in an autoclave, under steam pressure, at a temperature of from 115° to 120° C. for 15 minutes, or by boiling it during at least one hour. The solution should be freshly prepared before it is dispensed.

Liquor Sodii Hydroxidi.—Rubric changed from "about 5 percent." to "not less than 4.5 percent. of Sodium Hydroxide." Instructions for using Sodium Hydroxide of other than official strength omitted. Added test: Weigh accurately about 20 Gm. of Solution of Sodium Hydroxide and titrate it directly with normal hydrochloric acid V. S., using methyl-orange T. S. as indicator. It should show not more than 5.5 percent. of alkalinity, calculated as sodium hydroxide (limit of carbonate). Modified assays: Weigh accurately about 50 Gm. of Solution of Sodium Hydroxide, transfer it to a 250 Cc. graduated flask, add 20 Cc. of barium chloride T. S. and fill the flask to the mark with distilled water, which has been previously boiled and cooled. Then thoroughly agitate the liquid and pass it through a filter which has not been previously moistened (rejecting the first 20 Cc.) and titrate 100 Cc. of the clear filtrate with normal hydrochloric acid V. S., using phenolphthalein T. S. as indicator. It should show not less than 4.5 percent. of Sodium Hydroxide when calculated to the amount of solution originally taken. Each cubic centimeter of normal hydrochloric acid V. S. used corresponds to 0.04001 Gm. of Sodium Hydroxide (NaOH).

Liquor Zinci Chloridi.—Added assay: Weigh accurately about 0.6 Gm. of Solution of Zinc Chloride, in a tared flask, add 20 Cc. of distilled water and 50 Cc. of tenth-normal silver nitrate V. S., shake the mixture well and then add 2 Cc. of nitric acid and 2 Cc. of ferric ammonium sulphate T. S. The residual

titration of this liquid with tenth-normal potassium sulphocyanate V. S. should show not less than 49 percent. of Ziinc Chloride.

EXTRACTS.

Powdered Extracts.—In the preparation of Powdered Extracts, it has been necessary to use solvents that will extract the active principles of the drugs, and only the minimum amount of the inert constituents. Where the drug contains an oily constituent that is extracted by the menstruum directed, it becomes necessary to adopt a method for the separation of this oil so that the product will retain a satisfactory pulverulent form. The concentration of the liquids should be started without delay and undue exposure to heat must be avoided. The limit of temperature as stated in the formulas, should not be exceeded and the use of apparatus for carrying on the concentration under reduced pressure is recommended. The final drying of the soft extract can be greatly facilitated by spreading it upon plates of glass or tinned metal and exposing it to currents of warm air. For the convenience of the prescriber, the standards of strength for the powdered extracts have been so adjusted that each bears a definite relation to that of its respective drug of the average strength and a statement of the standard precedes the formula. For these powdered extracts that can be reliably assayed, alkaloidal standards have been adopted and assay methods are directed for the determination of their strength and to provide for standarization. In standardizing powdered extracts, suitable inert powders must be selected as diluents. In the official formulas, dried starch and magnesium oxide are directed, but it is permissible for the manufacturer to select as inert diluents, sugar, sugar of milk, powdered glycyrrhiza, magnesium carbonate or the finely powdered drug or marc from which the respective extract is made. In completing powdered extracts they must be thoroughly dried, powdered, mixed with the diluent and passed through a fine sieve and should be preserved in tightly-stoppered, small, wide-mouthed, amber-colored bottles, and stored in a cool and dry place. Pilular extracts should be protected from exposure to sunlight and air by keeping them in tightly-covered glass or earthenware jars.

Extractum Aconiti Pulveratum.—One Gm. of the Powdered Extract to represent 4 Gm. of average strength Aconite. Practically exhaust 1000 Gm. of Aconite, in No. 60 powder, by percolation, reserving the first 1000 Cc. of percolate. Use the following menstruum: Menstruum I: Tartaric acid 5 Gm. and alcohol 500 Cc.; Menstruum II: Alcohol. Distil the alcohol first from the second percolate, afterwards adding the reserve and reducing the residue to about 100 Cc. Treat this residue with two successive portions of 250 Cc. each of purified petroleum benzin, discarding the benzin, then add 50 Gm. of dried starch and concentrate the mixture on a water-bath, with frequent stirring. Spread the thick extract on glass plates, dry it in an air-bath at a temperature not exceeding 80° C.; powder the product, assay it and add enough dried starch to make the finished Powdered Extract conform to the required alkaloidal standard. Mix it thoroughly.

Extractum Belladonnæ Foliorum.—One Gm. of the Extract to represent 4 Gm. of average strength Belladonna Leaves. Powder changed from No. 40 to No. 60. Menstruum: Alcohol, 3 volumes, and water, 1 volume. Former menstruum:

Alcohol 2 volumes, water 1 volume. Evaporate percolate at a temperature not exceeding 70° C.; changed from 50° C. Add sufficient glucose, after assay, to make the finished Extract conform to the required alkaloidal standard. Sugar of Milk formerly used as a diluent.

Extractum Belladonnae Foliorum Pulveratum.—One Gm. of the Powdered Extract to represent 4 Gm. of average strength Belladonna Leaves. Practically exhaust 1000 Gm. of Belladonna Leaves in No. 40 powder, by percolation, reserving the first 1000 Cc. of percolate and using alcohol as the menstruum. Distil the alcohol first from the second percolate, afterwards adding the reserve and reducing the residue to a syrupy consistence. Evaporate this thick extract to a pilular consistence, at a temperature not exceeding 80° C., add 50 Gm. of dried starch and again heat at the same temperature, frequently stirring, until nearly dry. Then incorporate 20 Gm. of magnesium oxide and thoroughly dry the mixture in warm air. Powder the product, assay it, and add enough dried starch to make the finished Powdered Extract conform to the required alkaloidal standard. Mix it thoroughly.

Extractum Cannabis Indicae.—Temperature for evaporation of percolate limited to 70° C.

Extractum Cascarae Sagradae Pulveratum.—One Gm. of Powdered Extract of Cascara Sagrada to represent 3 Gm. of the drug. Practically exhaust 1000 Gm. of Cascara Sagrada in No. 20 powder, by percolation, using boiling water as the menstruum. Evaporate the percolate to dryness on a water-bath or steam-bath. Reduce the extract to a fine powder, weigh it, add 25 Gm. of magnesium oxide and enough dried starch to make the product weigh 300 Gm. Mix it thoroughly. Former menstruum: Alcohol, 125 volumes, and water, 875 volumes. Powdered glycyrrhiza formerly used as a diluent in making up the final weight.

Extractum Cimicifugae Pulveratum.—One Gm. of Powdered Extract of Cimicifuga to represent 4 Gm. of the drug. Practically exhaust 1000 Gm. of Cimicifuga in No. 40 powder, by percolation, using alcohol as the menstruum. Distil the alcohol from the percolate and evaporate the residue to dryness, with frequent stirring, on a water-bath, at a temperature not exceeding 80° C. Powder the extract, weigh it, add sufficient dried starch to make the product weigh 250 Gm. and mix thoroughly. Former extract prepared by evaporating the fluid-extract to complete dryness, powdering the product and using powdered glycyrrhiza as a diluent in making up the final weight.

Extractum Colchici Cormi Pulveratum.—One Gm. of the Powdered Extract to represent 4 Gm. of average strength Colchicum Corm. Practically exhaust 1000 Gm. of Colchicum Corm, in No. 60 powder, by percolation, using alcohol as the menstruum. Distil the alcohol from the percolate, at as low a temperature as possible, until the residue measures about 150 Cc. Treat this residue with two successive portions of purified petroleum benzin, discarding the benzin. Evaporate this syrupy residue to a thick extract, in a dish, incorporate 50 Gm. of dried starch, spread the mixture on glass plates and dry it thoroughly in an air bath at a temperature not exceeding 80° C. Powder the product, assay it, and add enough dried starch to make the finished Powdered Extract conform to the required alkaloidal standard. Mix it thoroughly. Former Extract of pilular

consistence. Menstrua formerly used. Menstruum I: Acetic acid 350 Cc., and water 1500 Cc. Menstruum II: Water.

Extractum Colocynthis Pulveratum.—One Gm. of Powdered Extract of Colocynth to represent 4 Gm. of the drug. Practically exhaust Colocynth in No. 20 powder, by percolation, using diluted alcohol as the menstruum. Distil the alcohol from the percolate, evaporate the residue to dryness on a water-bath or steam-bath, powder the extract, weigh it, and add sufficient dried starch to make the product weigh 250 Gm. Mix it thoroughly. Former process called for combined maceration and percolation, and the end-product was not required to be of a definite weight.

Extractum Colocynthis Compositum Pulveratum.—Purified Aloes changed to Curaçao Aloes, 60 Gm. of whole Cardamom changed to 50 Gm. of Cardamom Seed and enough soap used to make 1000 Gm. The other ingredients remain the same, all being mixed by trituration and then reduced to a No. 60 powder.

Extractum Ergotæ.—Exhaust the Ergot with purified petroleum bezin and dry the drug; then practically exhaust this drug by percolation with the following. Menstruum I: Alcohol, 850 Cc., water, 150 Cc., and hydrochloric acid, 10 Cc. Menstruum II: Alcohol, 85 volumes, and water 15 volumes. Evaporate the percolate so obtained, at a temperature not exceeding 70° C., to pilular consistence. The acid is not neutralized as formerly and glycerin is not added to the evaporated extract.

Extractum Euonymi Pulveratum.—One Gm. of Powdered Extract of Euonymus to represent 4 Gm. of the drug. Practically exhaust 1000 Gm. of Euonymus in No. 40 powder, by percolation, using alcohol 4 volumes and water 1 volume as the menstruum. Distil the alcohol from the percolate and evaporate the residue to dryness, with frequent stirring, at a temperature not exceeding 70° C. Powder the extract, weigh it, add sufficient dried starch to make the product weigh 250 Gm. and mix thoroughly. Former Extract prepared by evaporating the fluid-extract to complete dryness, powdering the product and using powdered glycyrrhiza as a diluent in making up the final weight.

Extractum Fellis Bovis Pulveratum.—To replace Purified Oxgall. One Gm. of Powdered Extract of Oxgall to represent 8 Gm. of Oxgall. Add 1000 Cc. of alcohol slowly and with agitation to 800 Gm. of Oxgall contained in a bottle, macerate for two days and then decant the liquid portion. Wash the residue in the bottle with an additional 500 Cc. of alcohol, decant the liquid portion, mix it with the liquid first separated and filter the mixture. Distil the alcohol from the filtrate and evaporate the residue to a thick extract at a temperature between 75° and 80° C. Spread this extract on glass plates and thoroughly dry in warm air, at a temperature not exceeding 80° C. Powder the extract, weigh it, and add sufficient dried starch to make 100 Gm. Mix it thoroughly.

Extractum Gelsemii Pulveratum.—One Gm. of Powdered Extract of Gelsemium to represent 4 Gm. of the drug. Practically exhaust 1000 Gm. of Gelsemium in No. 40 powder, by percolation, using alcohol as the menstruum. Distil the alcohol from the percolate until the residue measures about 500 Cc., transfer this to a dish and evaporate it to a soft extract with frequent stirring, at a temperature not exceeding 70° C. Add 50 Gm. of a mixture of 1 part of magnesium

oxide and 3 parts of dried starch, mix well, spread the mass in a thin layer on glass or tinned-metal plates or in a porcelain dish and continue the drying in an air-bath until thoroughly dry, at a temperature not exceeding 70° C. Powder the extract, weigh it, add sufficient of the mixture of magnesium oxide and dried starch to make 250 Gm., and mix thoroughly.

Extractum Gentianæ.—No change.

Extractum Glycyrrhizæ.—Added requirement: Ash not exceeding 6 percent.

Extractum Glycyrrhizæ Purum.—The menstruum is to be chloroform water instead of water after the ammonia has been used.

Extractum Hydrastis Pulveratum.—One Gm. of the Powdered Extract to represent 4 Gm. of average strength Hydrastis. Practically exhaust 1000 Gm. of Hydrastis in No. 40 powder, by percolation, using the following menstrua: Menstruum I: Tartaric acid 5 Gm. and alcohol 1000 Cc.; Menstruum II: Alcohol. Distil the alcohol from the percolate, and evaporate the residue to a soft extract, with frequent stirring, at a temperature not exceeding 70° C. Add 50 Gm. of a mixture of 1 part of magnesium oxide and 3 parts of dried starch, spread the mass in a thin layer on glass or tinned-metal plates or in a porcelain dish and continue the drying over an air-bath until thoroughly dry, at a temperature not exceeding 70° C. Powder the Extract, assay it and add enough of the mixture of magnesium oxide and dried starch to make the finished Powdered Extract conform to the required alkaloidal standard. Mix it thoroughly.

Extractum Hyoscyami.—One Gm. of the Extract to represent 4 Gm. of average strength Hyoscyamus. Practically exhaust Hyoscyamus in No. 40 powder, by percolation, with the following menstruum: Alcohol 3 volumes, and water 1 volume. Evaporate the percolate to a pilular consistence at a temperature not exceeding 70° C., and, after assay, add sufficient glucose to make the finished Extract conform to the required alkaloidal standard. Former Extract prepared by evaporating the fluidextract to pilular consistence, and adjusting the weight by assay, sugar of milk being used as the diluent.

Extractum Malti.—The temperature for maceration and evaporation not to exceed 60° C., changed from 55° C. Evaporate until of a specific gravity of not less than 1.350, nor more than 1.400 at 25° C.; formerly "to the consistence of thick honey."

Extractum Nucis Vomica Pulveratum.—One Gm. of the Powdered Extract to represent 4 Gm. of average strength Nux Vomica. Practically exhaust 1000 Gm. of Nux Vomica, in No. 20 powder, by percolation, using alcohol 3 volumes, and water 1 volume as the menstruum. Distil the alcohol from the percolate and reduce the residue to about 200 Cc. Treat this residue with a mixture of 150 Cc. of water and 200 Cc. of purified petroleum benzin, separate the benzin layer, again treat the residue with 100 Cc. of purified petroleum benzin and decant as before. Wash the separated benzin with three successive 100 Cc. portions of a mixture made by adding 10 parts of sulphuric acid to 100 parts of water. Collect these acid washings, make alkaline with ammonia water and shake out with three portions of chloroform, 20 Cc., 10 Cc., and 10 Cc. Add the combined chloroform solution to the Extract residue and evaporate the mixture to dryness on a water-bath. Powder the product, assay it, and add enough

of a mixture of magnesium oxide 1 part and dried starch 3 parts to make the finished Powdered Extract conform to the required alkaloidal standard. Mix it thoroughly. Former menstrua: Menstruum I: Acetic acid 500 Cc., and water 1300 Cc.; Menstruum II: Water. Sugar of milk was used as a diluent in making up the final weight.

Extractum Opii Pulveratum.—One Gm. of the Powdered Extract to represent 2 Gm. of average strength Opium. Beat 100 Gm. of Opium in a mortar with 300 Cc. of hot water until a smooth paste is produced, add to this 100 Gm. of clean, white sand, mix it thoroughly and transfer the mixture to a percolator. Practically exhaust the Opium by percolation, using water as the menstruum and evaporate the percolate to dryness in a dish, on a water-bath. Powder the product, assay it and add enough dried starch to make the finished Powdered Extract conform to the required alkaloidal standard. Mix it thoroughly. Former process called for combined maceration and percolation. Sugar of milk was formerly used as a diluent in making up the final weight.

Extractum Rhei Pulveratum.—One Gm. of the Powdered Extract to represent 2 Gm. of average strength Rhubarb. Practically exhaust 1000 Gm. of Rhubarb in No. 40 powder, by percolation, using alcohol 4 volumes, and water 1 volume as the menstruum. Distil the alcohol from the percolate and continue distillation until a residue of syrupy consistence remains; transfer this to a dish and evaporate the mixture to dryness, with frequent stirring, at a temperature not exceeding 80° C. Powder the extract and add 50 Gm. of magnesium oxide and sufficient dried starch to make 500 Gm. Mix it thoroughly. Former Extract prepared by evaporating the fluidextract to pilular consistence.

Extractum Stramonii.—One Gm. of the Extract to represent 4 Gm. of average strength Stramonium. Practically exhaust Stramonium in No. 30 powder by percolating with the following menstruum: Alcohol 3 volumes and water 1 volume. Evaporate the percolate to a pilular consistence at a temperature not exceeding 70° C. and, after assay, add sufficient glucose to make the finished Extract conform to the required alkaloidal standard. Former Extract prepared by evaporating the fluidextract to pilular consistence and adjusting the weight by assay, sugar of milk being used as the diluent.

Extractum Stramonii Pulveratum.—One Gm. of the Powdered Extract to represent 4 Gm. of average strength Stramonium. Practically exhaust 1000 Gm. of Stramonium in No. 40 powder, by percolation, reserving the first 1000 Cc. of percolate. Use alcohol as the menstruum. Distil the alcohol first from the second percolate and reduce it to about 100 Cc., afterwards adding the reserve and reducing the residue to a syrupy consistence. Evaporate this residue in a dish to a soft extract, with frequent stirring, at a temperature not exceeding 70° C., add 50 Gm. of dried starch and continue the heating at the same temperature, with frequent stirring, until the mass is nearly dry. Now incorporate 20 Gm. of magnesium oxide and thoroughly dry it in a current of warm air. Powder the product, assay it, and add enough dried starch to make the finished Powdered Extract conform to the required alkaloidal standard. Mix it thoroughly.

Extractum Sumbul.—Practically exhaust Sumbul in No. 30 powder, by percolation, with the following menstruum: Alcohol 4 volumes and water 1 volume,

and evaporate the percolate to a pilular consistence at a temperature not exceeding 70° C. Former Extract prepared by evaporating the fluidextract to a pilular consistence.

Extractum Taraxaci.—No change.

FLUIDEXTRACTS.

Introductory Statements.—Fluidextracts are concentrated liquid preparations of vegetable drugs, containing alcohol either as a solvent or as a preservative, and bearing a uniform relation to the drug used so that 1 Cc. of the fluidextract approximately represents the activity of 1 Gm. of the air-dried powdered drug. The fluidextracts of this Pharmacopœia, with few exceptions, may be classified according to the menstruum used in the extraction of the drug and the process of manufacture employed. Several drugs require special manipulation to obtain satisfactory fluidextracts, and for these appropriate formulas have been devised and are printed in full in the text. The following type processes are described, and in each formula the process to be used is designated by reference to the type process: Type Process A: In this class are included those fluidextracts that are made with a menstruum of alcohol or a mixture of alcohol and water by the usual process of percolation. Type Process B: In this class are included those fluidextracts in which glycerin or an acid is used in the extraction and two menstrea are successively used. Menstruum I contains the glycerin or acid in definite proportion to the amount of the drug, and Menstruum II, a mixture of alcohol and water intended for completing the exhaustion of the drug. Type Process C: The process of Fractional or Divided Percolation. This is especially recommended for drugs containing volatile ingredients of constituents injured by exposure to heat. This process may likewise be used as an alternative process in the formulas in which Type Process A is directed. Type Process D: In this class are included those fluidextracts in which extraction is effected by infusion and percolation with boiling water, alcohol being added to the concentrated extract as a preservative.

PROCESSES.

Type Process A.—Moisten 1000 Gm. of the powdered drug which is directed with a sufficient quantity of the prescribed menstruum to render it evenly and distinctly damp and to maintain it so after macerating for 6 hours in a tightly covered container. Then pack it in a cylindrical percolator and add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding more menstruum until the drug is practically exhausted. Reserve the first 850 Cc. of the percolate (unless otherwise specified in the formula); recover the alcohol from the remainder and concentrate to a soft extract at a temperature not exceeding 60° C.; dissolve this in the reserved portion, mix thoroughly and finally add a sufficient quantity of the menstruum to obtain 1000 Cc. or the proper volume determined by the assay standard.

Type Process B.—Moisten 1000 Gm. of the powdered drug, which is directed,

with a sufficient quantity of the prescribed Menstruum I, to render it evenly and distinctly damp and to maintain it so after macerating for 6 hours in a tightly covered container; pack it in a cylindrical percolator, add the remainder of Menstruum I, and when this has just disappeared from the surface, gradually add Menstruum II, constantly maintaining a stratum of liquid above the drug. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for 48 hours, and then allow the percolation to proceed slowly, gradually adding Menstruum II, until the drug is practically exhausted. Reserve the first 850 Cc. of the percolate (unless otherwise specified in the formula); recover the alcohol from the remainder and concentrate to a soft extract at a temperature not exceeding 60° C.; dissolve this in the reserved portion, mix thoroughly and finally add a sufficient quantity of Menstruum II to obtain 1000 Cc. or the proper volume determined by the assay standard.

Type Process C.—Divide 1000 Gm. of the drug, which is directed, into three portions of 500 Gm., 300 Gm., and 200 Gm., respectively. Moisten the first portion of the drug (500 Gm.) with a sufficient quantity of the prescribed menstruum to render it evenly and distinctly damp and to maintain it so after macerating for 6 hours in a tightly covered container. Then pack it in a cylindrical percolator and add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for 48 hours and then allow the percolation to proceed slowly, gradually adding more menstruum. Reserve the first 200 Cc. of percolate and continue the percolation until 1500 Cc. of additional percolate have been collected in successive portions of 300 Cc. each. Moisten the second portion of the drug (300 Gm.) with a sufficient quantity of the percolate collected in the preceding operation immediately after the reserved portion, to render it evenly and distinctly damp and to maintain it so after macerating for 6 hours in a tightly covered container. Then pack it in a cylindrical percolator and macerate and percolate in the same manner, using as menstruum the several portions of percolate from the preceding operation in the order in which they have been collected and, if this be insufficient, follow with some of the original menstruum. Reserve the first 300 Cc., continue the percolation and collect the weaker percolate in successive portions of 200 Cc. each. Moisten the third portion of the drug (200 Gm.) with a sufficient quantity of the percolate collected in the preceding operation immediately after the reserved portion, to render it evenly and distinctly damp and to maintain it so after macerating 6 hours in a tightly covered container. Then pack it in a cylindrical percolator and macerate and percolate in the same manner, using as menstruum the several portions of percolate from the preceding operation in the order in which they have been collected and, if this be insufficient, follow with more of the original menstruum. Collect 500 Cc. of percolate and mix this with the two portions previously reserved so as to make 1000 Cc. of finished fluid-extract. When Type Process C is directed for fluidextracts which are adjusted by assay to a definite alkaloidal standard, collect only 420 Cc. of percolate from the third portion of drug instead of the 500 Cc. directed in the Process.

Mix this percolate with the two portions previously reserved, assay a sample of the mixture and then adjust its volume, by the addition of the menstruum directed, so that each 100 Cc. of finished fluidextract will contain the prescribed amount of alkaloid.

Type Process D.—To 1000 Gm. of the ground drug add 5000 Cc. of boiling water, mix thoroughly and allow to macerate in a covered container for 2 hours in a warm place. Then transfer the moist drug to a tinned or enameled metallic percolator and allow percolation to proceed, gradually adding boiling water until the drug is practically exhausted. Evaporate the percolate on a water-bath or steam-bath to the volume specified and when cold add the alcohol directed and mix thoroughly. In the preparation of fluidextracts by either Process A, B, or C, the rate of percolation must be carefully controlled and for the quantities directed in the formulas of the Pharmacopœia, the flow should not exceed ten drops per minute until the reserved percolate is collected and 20 drops per minute thereafter. With careful percolation, most drugs will be practically extracted when 3000 Cc. of percolate have been obtained from each 1000 Gm. of the drug. Fluidextracts should be kept in tightly-stoppered containers for one month and then, if perfectly clear, stored in amber-colored bottles protected from sunlight and extremes of temperature. If sedimentation has occurred, the clear portion should be decanted, the remainder filtered and both liquids thoroughly mixed before storing. The quantity of alcohol in finished fluidextracts is less than the amount of alcohol in the menstrua employed, this is due to loss by evaporation during manufacture, variations in the amount of water in air-dried drugs and the absorption of moisture from the air, hence if the percentage of alcohol in the finished product is desired, it may be determined by the process for Alcohol Determination.

Fluidextractum Aconiti.—Powder changed from No. 60 to No. 40. Prepare by Type Process C, modified as directed for alkaloidal drugs. Menstruum: Alcohol 3 volumes and water 1 volume.

Fluidextractum Apocyni.—Powder changed from No. 60 to No. 30. Prepare by Type Process B. Menstruum I: Glycerin 100 Cc., alcohol 600 Cc., and water 300 Cc. Menstruum II: Alcohol 3 volumes, and water 2 volumes.

Fluidextractum Aromaticum.—Aromatic Powder 1000 Gm. Prepare by Type Process C. Menstruum: Alcohol.

Fluidextractum Aurantii Amari.—Powder changed from No. 40 to No. 20. Prepare by Type Process C. Menstruum: Alcohol 3 volumes and water 1 volume. Former menstruum: Alcohol 2 volumes and water 1 volume.

Fluidextractum Belladonnæ Radicis.—Powder changed from No. 60 to No. 40. Prepare by Type Process A, modified for alkaloidal drugs. Reserve the first 800 Cc. of percolate instead of 850 Cc., as there directed. Menstruum: Alcohol 5 volumes and water 1 volume. Former menstruum: Alcohol 4 volumes and water 1 volume.

Fluidextractum Buchu.—Powder changed from No. 60 to No. 40. Prepare by Type Process A. Menstruum: alcohol. Former menstruum: alcohol 3 volumes and water 1 volume.

Fluidextractum Cannabis Indicae.—Prepare by Type Process A. Menstruum, alcohol.

Fluidextractum Cascarae Sagradae.—Prepare by Type Process D; evaporate to 750 Cc. and add 250 Cc. of alcohol. Former menstruum: alcohol 2 volumes and water 4 volumes.

Fluidextractum Cimicifugae.—Powder changed from No. 60 to No. 40. Prepare by Type Process A. Menstruum: alcohol.

Fluidextractum Cinchonae.—Powder changed from No. 60 to No. 40. Prepare by Type Process B, modified for alkaloidal drugs. Menstruum I: glycerin 100 Cc., diluted hydrochloric acid 100 Cc., and alcohol 800 Cc. Menstruum II: alcohol 4 volumes and water 1 volume. Former menstruum I: glycerin 100 Cc., alcohol 800 Cc. and water 100 Cc.

Fluidextractum Colchici Seminis.—Powder changed from No. 50 to No. 40. Remove the fat by percolation with purified petroleum benzin and then proceed by Type Process A, modified for alkaloidal drugs. Menstruum: alcohol 2 volumes and water 1 volume.

Fluidextractum Digitalis.—Powder changed from No. 60 to No. 30. Prepare by Type Process A. Menstruum: alcohol 5 volumes and water 1 volume. Former menstruum: diluted alcohol.

Fluidextractum Ergotae.—Powder changed from No. 60 to No. 40. Prepare by Type Process B. Menstruum I: hydrochloric acid 20 Cc. and diluted alcohol 980 Cc. Menstruum II: diluted alcohol. Former menstruum I: acetic acid 20 Cc. and diluted alcohol 980 Cc.

Fluidextractum Eriodictyi.—Powder changed from No. 60 to No. 30. Prepare by Type Process A, reserving the first 800 Cc. of percolate instead of 850 Cc. as there directed. Menstruum: alcohol 4 volumes and water 1 volume.

Fluidextractum Eucalypti.—Powder changed from No. 40 to No. 30. Prepare by Type Process A, reserving the first 800 Cc. of percolate instead of 850 Cc. as there directed. Menstruum: alcohol 3 volumes and water 1 volume.

Fluidextractum Gelsemii.—Powder changed from No. 60 to No. 40. Prepare by Type Process A. Menstruum: alcohol 4 volumes and water 1 volume. Former menstruum: alcohol.

Fluidextractum Gentianae.—Prepare by Type Process A. Menstruum: diluted alcohol.

Fluidextractum Glycyrrhizae.—New process: Practically exhaust the Glycyrrhiza with a menstruum made in the proportion of ammonia water, 1 volume and chloroform-water, 9 volumes, after moistening and macerating 48 hours. Reserve the first 500 Cc. of percolate, evaporate the remainder on a water-bath to a soft extract, dissolve it in the reserved portion, add water to make 750 Cc. and a few drops of ammonia water, if necessary, for solution. Then gradually add 250 Cc. of alcohol, allow it to stand for 7 days, decant the clear liquid, filter the remainder and wash the filter with a mixture of alcohol, 1 volume, and water, 3 volumes, to make 1000 Cc.

Fluidextractum Granati.—Prepare by Type Process B. Menstruum I:

glycerin 100 Cc., alcohol 500 Cc. and water 400 Cc. Menstruum II: diluted alcohol. Former menstruum I: glycerin 100 Cc. and diluted alcohol 900 Cc.

Fluidextractum Grindeliæ.—Prepare by Type Process A. Menstruum: alcohol 3 volumes and water 1 volume.

Fluidextractum Guaranæ.—Prepare by Type Process A, modified for alkaloidal drugs. Reserve the first 800 Cc. of percolate instead 850 Cc. as there directed. Menstruum: alcohol 3 volumes and water 1 volume. Former menstruum: diluted alcohol.

Fluidextractum Hydrastis.—Powder changed from No. 60 to No. 40. Prepare by Type Process B, modified for alkaloidal assay. Reserve the first 750 Cc. of percolate instead of 850 Cc. as there directed. Menstruum I: glycerin 100 Cc., alcohol 600 Cc. and water 200 Cc. Menstruum II: alcohol 2 volumes and water 1 volume. Former menstruum I: glycerin 100 Cc., alcohol 600 Cc. and water 300 Cc.

Fluidextractum Hyoscyami.—Powder changed from No. 60 to No. 40. Prepare by Type Process A, modified for alkaloidal drugs. Menstruum: alcohol 3 volumes and water 1 volume. Former menstruum: alcohol 2 volumes and water 1 volume.

Fluidextractum Ipecacuanhæ.—Powder changed from No. 80 to No. 60. Prepare by Type Process B, modified for alkaloidal drugs. Reserve the first 800 Cc. of percolate instead of 850 Cc. as there directed. Menstruum I: diluted hydrochloric acid 100 Cc., alcohol 200 Cc., and water 200 Cc. Menstruum II: alcohol 2 volumes and water 3 volumes. Former menstruum: alcohol 3 volumes and water 1 volume.

Fluidextractum Lobeliæ.—Powder changed from No. 50 to No. 30. Prepare by Type Process B. Menstruum I: acetic acid 50 Cc., alcohol 500 Cc., and water 450 Cc. Menstruum II: diluted alcohol. Former menstruum: acetic acid 275 volumes and water 725 volumes.

Fluidextractum Nucis Vomicae.—Prepare by Type Process A, modified for alkaloidal drugs. Reserve the first 800 Cc. of percolate instead of 850 Cc. as there directed. Menstruum: alcohol 3 volumes and water 1 volume. Former menstruum I: acetic acid 50 Cc., alcohol 750 Cc. and water 250 Cc. Former menstruum II: alcohol 3 volumes and water 1 volume.

Fluidextractum Pareiræ.—Powder changed from No. 40 to No. 30. Prepare by Type Process A. Menstruum I: diluted alcohol. Former menstruum I: glycerin 100 Cc., alcohol 600 Cc. and water 300 Cc. Former menstruum II: alcohol 3 volumes and water 2 volumes.

Fluidextractum Pilocarpi.—Powder changed from No. 40 to No. 30. Prepare by Type Process A, modified for alkaloidal drugs. Reserve the first 800 Cc. of percolate instead of 850 Cc. as there directed. Menstruum: alcohol 2 volumes and water 1 volume. Former menstruum: diluted alcohol.

Fluidextractum Podophyli.—Prepare by Type Process A. Menstruum: alcohol. Former menstruum: alcohol 4 volumes and water 1 volume.

Fluidextractum Rhei.—Prepare by Type Process A. Menstruum: alcohol 4 volumes and water 1 volume.

Fluidextractum Sabal.—Sabal, in No. 20 powder. Prepare by Type Process A. Menstruum: alcohol 4 volumes and water 1 volume.

Fluidextractum Sarsaparillæ.—Powder changed from No. 30 to No. 20. Prepare by Type Process A. Menstruum: diluted alcohol. Former menstruum: alcohol 1 volume and water 2 volumes.

Fluidextractum Sarsaparillæ Compositum.—Sarsaparilla powder changed from No. 30 to No. 20. Glycyrrhiza powder changed from No. 30 to No. 20. Mix the powders and prepare by Type Process B. Menstruum I: glycerin 100 Cc., alcohol 500 Cc. and water 400 Cc. Menstruum II: diluted alcohol. Former menstruum I: glycerin 100 Cc. and diluted alcohol 900 Cc.

Fluidextractum Senegæ.—Powder changed from No. 40 to No. 30. Practically exhaust the Senega with a menstruum made in the proportion of alcohol, 2 volumes, and water, 1 volume, after moistening and macerating the drug for 48 hours. Reserve the first 800 Cc. of percolate, evaporate the remainder to a soft extract, and dissolve this in the reserve. Add ammonia water until the liquid is faintly alkaline and then enough of the menstruum to make 1000 Cc. Former menstruum I: solution of potassium hydroxide 30 Cc., alcohol 600 Cc. and water 300 Cc. Former menstruum II: alcohol 2 volumes and water 1 volume.

Fluidextractum Sennæ.—Prepare by Type Process A, reserving the first 800 Cc. of percolate instead of 850 Cc. as there directed. Menstruum: alcohol 1 volume and water 2 volumes. Former process: The drug was exhausted with alcohol, the percolate being discarded. The fluidextract was then prepared with a menstruum of diluted alcohol.

Fluidextractum Spigeliæ.—Prepare by Type Process A. Menstruum: diluted alcohol.

Fluidextractum Staphisagriæ.—Powder changed from No. 40 to No. 20. Prepare by Type Process A. Menstruum: alcohol. Former menstruum: alcohol 4 volumes and water 1 volume. Remove the oil from the freshly prepared fluidextract by adding 20 Gm. of purified talc and filtering the mixture.

Fluidextractum Stillingiæ.—Powder changed from No. 40 to No. 30. Prepare by Type Process A. Menstruum: diluted alcohol.

Fluidextractum Sumbul.—Prepare by Type Process A. Menstruum: alcohol 4 volumes and water 1 volume. Former menstruum: alcohol 3 volumes and water 1 volume.

Fluidextractum Taraxaci.—Prepare by Type Process B. Menstruum I: glycerin 100 Cc., alcohol 500 Cc. and water 400 Cc. Menstruum II: diluted alcohol. Former process: Menstruum: diluted alcohol; 5 percent. of solution of sodium hydroxide was added to complete the fluidextract.

Fluidextractum Tritici.—Prepare by Type Process D. Evaporate to 800 Cc. and add 200 Cc. of alcohol.

Fluidextractum Uvæ Ursi.—Prepare by Type Process B, reserving the first 800 Cc. of percolate instead of 850 Cc. as there directed. Menstruum I: glycerin 100 Cc., alcohol 300 Cc. and water 500 Cc. Menstruum II: alcohol 1 volume and water 2 volumes. Former menstruum I: glycerin 300 Cc., alcohol

200 Cc., water 500 Cc. Former menstruum II: alcohol 2 volumes and water 5 volumes.

Fluidextractum Veratri.—Powder changed from No. 60 to No. 40. Prepare by Type Process A. Menstruum: alcohol.

Fluidextractum Viburni Prunifolii.—Powder changed from No. 40 to No. 30. Prepare by Type Process A. Menstruum: alcohol 2 volumes, water 1 volume.

Fluidextractum Xanthoxyli.—Powder changed from No. 40 to No. 30. Prepare by Type Process A. Menstruum: alcohol 3 volumes and water 1 volume.

Fluidextractum Zingiberis.—Powder changed from No. 50 to No. 40. Prepare by Type A. Menstruum: alcohol.

RESINS.

Resina Podophylli.—Added test: On adding 0.4 Gm. of Resin of Podophyllum to 3 Cc. of 60 percent. alcohol, introducing 0.5 Cc. of potassium hydroxide T. S., and gently shaking the mixture, it should not gelatinize (difference from Resin of Podophyllum obtained from P. Emodi). Ash not exceeding 1.5 percent. changed from "1 percent."

Resina Jalapæ.—Modified tests: "Not more than 12 percent. of Resin of Jalap should be soluble in ether," changed from "15 percent." Added test: The requirement that the ammonia water solution should not become gelatinous on standing has been added to the test for rosin, guaiac and other resins. Melting point omitted. Added tests: Water triturated with the Resin should not have a bitter taste (aloin). Dissolve 0.02 Gm. of Jalap in 2 Cc. of glacial acetic acid and add a few drops of sulphuric acid; the mixture should not acquire a pink color (resin). Modified test: Shake 0.02 Gm. of Resin of Jalap with 5 Cc. of ether, filter and evaporate the ethereal solution on a piece of filter paper. No greenish-blue color should be produced by the addition of a drop of ferric chloride T. S. to the filter paper (guaiac). Test for limit of saponifiable substances omitted.

Resina Scammonii.—Modified tests: "Not less than 95 percent. should be soluble in ether (distinction from resin of jalap and resin of false scammony)," changed from "almost completely soluble in ether and chloroform." When triturated with water, it does not alone form an emulsion. Percolate Scammony Root, in No. 30 powder, until the percolate produces only a slight turbidity when dropped into water. Distil the alcohol from the percolate, reducing it to the consistence of thin syrup, and pour it slowly with constant stirring into 1000 Cc. of hot water. Decant the supernatant liquid, wash the precipitated Resin twice, by decantation, with fresh portions of 1000 Cc. each of hot water and dry the Resin on a water-bath. Added tests: Its solution in alcohol does not give a blue color with ferric chloride T. S. or with solution of hydrogen dioxide (guaiac). Sulphuric acid should not gradually turn red when stirred in a porcelain dish with an equal weight of Resin of Scammony (rosin).

TINCTURES.

Tinctura Aconiti.—Powder changed from No. 60 to No. 40. Continue the operation until the percolate measures 950 Cc., assay it, and add enough men-

struum to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Aloes.—"Purified Aloes" changed to "Socotrine Aloes."

Tinctura Arnica.—Moisten 200 Gm. of Arnica with 500 Cc. of diluted alcohol, and, without pressing the powder, allow it to stand in a well covered percolator for 24 hours, then pack it with moderate pressure and allow the percolation to proceed slowly, adding diluted alcohol until the percolate measures 250 Cc. Now stop the flow, macerate the drug for an additional twenty-four hours, and then continue the percolation until the total percolate measures 500 Cc. Again interrupt percolation, macerate the drug for another twelve hours and afterwards collect an additional 250 Cc. of percolate. Again macerate the drug for twelve hours and then percolate slowly, pouring on sufficient diluted alcohol to make 1000 Cc. of Tincture. The former process required maceration, expression and filtration.

Tinctura Asafetida.—No change.

Tinctura Aurantii Amari.—No change

Tinctura Aurantii Dulcis.—The Sweet Orange Peel is to be "grated from the fresh fruit" instead of "in thin shavings and cut into narrow shreds from the fresh fruit."

Tinctura Belladonnae Foliorum.—Continue the operation until the percolate measures 950 Cc., assay it, and add enough diluted alcohol to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Benzoini.—No change.

Tinctura Benzoini Composita.—"Purified Aloes" changed to "Socotrine Aloes."

Tinctura Calumbæ.—No change.

Tinctura Cannabis Indica.—No change.

Tinctura Capsici.—No change.

Tinctura Cardamomi.—150 Gm. of Cardamom Seed replaces 200 Gm. of Cardamon (U. S. P. VIII, fruits and seeds).

Tinctura Cardamomi Composita.—20 Gm. of Cardamon Seed replaces 250 Gm. of Cardamon (U. S. P. VIII, fruits and seeds).

Tinctura Cinnamomi.—Use the proportion of glycerin, alcohol and water as a menstruum throughout, which was used in the former process for the first 1000 Cc. There the percolation was completed with a menstruum of alcohol 675 volumes, and water 250 volumes.

Tinctura Colchici Seminis.—Continue the operation until the percolate measures 950 Cc., assay it, and add enough menstruum to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Ferri Chloridi.—Rubric changed from "not less than 13.28 percent. of the anhydrous salt, corresponding to 4.6 (4.58) percent. of metallic iron" to

"not less than 13 percent. of anhydrous Ferric Chloride corresponding to 4.48 percent. of iron." Specific gravity changed from "about 1.005" to "about 1.000" at 25° C. Modified assay: Weigh accurately about 5 Gm. of Tincture of Ferric Chloride in a tared weighing-bottle, and evaporate it to dryness in a porcelain dish on a water-bath, add 2 Cc. of hydrochloric acid and 5 Cc. of solution of hydrogen dioxide to the residue and again evaporate the mixture to dryness. Dissolve this residue in 25 Cc. of distilled water, mix it with 3 Cc. of hydrochloric acid and about 1 Gm. of potassium iodide in a 250 Cc. glass-stoppered flask, and allow the mixture to stand for 45 minutes at a temperature of 40° C. The resulting solution, when cooled, diluted with 100 Cc. of distilled water and titrated with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator, should show not less than 4.48 percent. of iron.

Tinctura Gambir Composita.—No change.

Tinctura Gelsemii.—No change.

Tinctura Gentianæ Composita.—Cardamom Seed replaces Cardamom (U. S. P. VIII, fruits and seeds). Menstruum I: glycerin 100 Cc., alcohol 500 Cc. and water 400 Cc. Menstruum II: diluted alcohol. Former menstruum alcohol 3 volumes and water 2 volumes.

Tinctura Guaiaci.—No change.

Tinctura Guaiaci Ammoniata.—No change.

Tinctura Hydrastis.—Menstruum changed from alcohol 65 volumes and water 35 volumes to alcohol 2 volumes and water 1 volume. Continue the operation until the percolate measures 950 Cc., assay it, and add enough menstruum to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Hyoscyami.—Continue the operation until the percolate measures 950 Cc., assay it, and add enough diluted alcohol to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Iodi.—Modified assay: Evaporate 10 Cc. of Tincture of Iodine in a tared, porcelain dish on a water-bath and gently heat the residue over a Bunsen flame to volatilize the Iodine; it should leave a residue weighing not less than 0.45 Gm., which should correspond to the identity tests given under Potassii Iodidum. Mix 5 Cc. of Tincture of Iodine with 25 Cc. of distilled water and titrate it with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator; it should show not less than 6.75 Gm. nor more than 7.25 Gm. of Iodine in each 100 Cc. of Tincture.

Tinctura Kino.—Pour 500 Cc. of boiling water on 100 Gm. of Kino in a capacious flask, agitate the mixture thoroughly and then heat it on a water-bath, containing boiling water, for one hour, shaking it frequently. Cool, add enough recently boiled water to make 500 Cc. and then add 500 Cc. of alcohol. Stopper the flask, set it aside in a cool place for 24 hours and decant the mixture through cheese cloth. Preserve it in a cool and dark place, in small bottles, tightly

corked. Former Tincture contained 5 Gm. of Kino for 100 Cc. Former menstruum contained 15 percent. of glycerin and 65 percent. of alcohol by volume.

Tinctura Lactucarii.—No change.

Tinctura Lavandulae Composita.—No change.

Tinctura Limonis Corticis.—The Lemon Peel is to be "grated from the fresh fruit" instead of "in thin shavings and cut into narrow shreds from the fresh fruit."

Tinctura Lobeliae.—No change

Tinctura Moschi.—No change.

Tinctura Myrrhae.—No change.

Tinctura Nucis Vomicae.—Percolate Nux Vomica in No. 40 powder, with a menstruum of alcohol 3 volumes and water 1 volume until the percolate measures 950 Cc., assay it, and add enough menstruum to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was prepared by dissolving 20 Gm. of the Extract in enough of a mixture of alcohol 3 volumes and water 1 volume to make 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Opii.—Continue the operation until the percolate measures 950 Cc., assay it, and add enough menstruum to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Opii Camphorata.—No change.

Tinctura Opii Deodorati.—Wash the residue on the filter with enough water to make the filtrate measure 950 Cc., assay it, and add enough water to make the finished Tincture conform to the required alkaloidal standard. The residue on the filter was washed with enough water to make 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Physostigmatis.—Continue the operation until the percolate measures 950 Cc., assay it, and add enough alcohol to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Pyrethri.—No change.

Tinctura Quassiae.—Menstruum: alcohol 1 volume and water 2 volumes. Former menstruum: alcohol 35 volumes and water 65 volumes.

Tinctura Rhei.—30 Gm. of Cardamom Seed replaces 40 Gm. of Cardamom (U. S. P. VIII, fruits and seeds). Menstruum I: glycerin 100 Cc., alcohol 500 Cc., and water 400 Cc. Menstruum II: diluted alcohol. Former Menstruum I: no change. Former Menstruum II: alcohol 5 volumes and water 4 volumes.

Tinctura Rhei Aromatica.—Menstruum I: glycerin 100 Cc., alcohol 500 Cc., and water 400 Cc. Menstruum II: diluted alcohol. Former Menstruum I: no change. Former Menstruum II: alcohol 5 volumes and water 4 volumes.

Tinctura Scillae.—Prepared by percolation, changed from maceration.

Tinctura Stramonii.—Continue the operation until the percolate measures 950 Cc., assay it, and add enough diluted alcohol to make the finished Tincture conform to the required alkaloidal standard. The former Tincture was percolated to 1000 Cc. without the adjustment of the final volume by assay.

Tinctura Strophanthi.—Powder changed from No. 60 to No. 40. Percolate the 100 Gm. of *Strophanthus* with purified petroleum benzin until the percolate no longer leaves a greasy stain when evaporated from filter paper. Then dry the drug so treated and afterwards percolate it with a menstruum of alcohol to obtain 1000 Cc. of Tincture. The former Tincture was prepared by percolating with a menstruum of alcohol 65 volumes and water 35 volumes to make 1000 Cc. of Tincture.

Tinctura Tolutana.—No change.

Tinctura Valerianæ.—Powder changed from No. 60 to No. 40.

Tinctura Valerianæ Ammoniata.—Powder changed from No. 60 to No. 40.

Tinctura Vanilla.—Macerate 100 Gm. of Vanilla, cut into small pieces, with 500 Cc. of alcohol in a stoppered container, in a moderately warm place, for 2 days, with frequent agitation; then transfer it to a plain filter and reserve the filtered liquid. Dry the drug on the filter by exposure to air until all of the alcohol has evaporated, then grind the Vanilla and 200 Gm. of coarse sugar to a uniform powder, pack this in a percolator and slowly percolate it first with a mixture of the reserved filtrate and an equal volume of water and then with sufficient diluted alcohol to make 1000 Cc. of Tincture. Former Menstruum: alcohol 65 volumes and water 35 volumes. Formerly prepared by macerating 100 Gm. of Vanilla in 500 Cc. of the menstruum during 12 hours, draining off the liquid, reserving it and beating the Vanilla and 200 Gm. of sugar in a mortar to a uniform powder. Then percolate the mixture with the reserved liquid and enough of the menstruum to make 1000 Cc.

Tinctura Veratri.—"Veratrum" (U. S. P. VIII, *Veratrum Viride* or *Veratrum album*) changed to *Veratrum Viride*.

Tinctura Zingiberis.—Powder changed from No. 50 to No. 30. Added tests: Tincture of Ginger should yield not less than 90 percent. of absolute alcohol by volume when tested as described under Alcohol Determination. Evaporate 10 Gm. of Tincture of Ginger to dryness, in a tared dish on a water-bath; the yield of residue should not exceed 2 percent. When treated with 20 Cc. of cold distilled water, not more than 15 percent. of this residue should dissolve. Evaporate 10 Cc. of Tincture of Ginger to dryness in a small flask. Add 5 Cc. of half-normal alcoholic potassium hydroxide V. S. and boil the mixture gently for 30 minutes under a reflux condenser. Remove the condenser and evaporate the alcohol on a water-bath. Then add 50 Cc. of distilled water to dissolve the residue, transfer this aqueous solution to a separatory funnel and shake it out with 25 Cc. of ether. Evaporate the separated ether solution spontaneously by adding it, a few drops at a time, to the center of a watch glass and cautiously apply the tip of the tongue to the dry residue. The taste should be slightly camphor-

aceous but not sharp or biting-pungent (capsicum or similar pungent substitute for ginger).

MISCELLANEOUS GALENICALS.

No material change to be made in the Eighth Revision text for the following articles:

Acetum Scillæ	Oleoresina Cubebæ
Emulsum Amygdalæ	Pilulæ Aloes
Emulsum Asafœtidæ	Pilulæ Asafœtidæ
Gelatinum Glycerinatum	Pilulæ Catharticæ Compositæ
Glyceritum Amyli	Pilulæ Ferri Carbonatis
Glyceritum Boroglycerini	Pilulæ Ferri Iodidi
Glyceritum Phenolis	Pilulæ Phosphori
Infusum Sennæ Compositum	Pilulæ Rhei Compositæ
Linimentum Belladonnæ	Potassii Citras Effervescens
Linimentum Calcis	Pulvis Cretæ Compositus
Linimentum Chloroformi	Pulvis Effervescens Compositus
Massa Ferri Carbonatis	Sodii Phosphas Effervescens
Mistura Cretæ	Triturationes
Mucilago Tragacanthæ	Trituratio Elaterini

Caffeina Citrata Effervescens.—No change in formula and process. Rubric added: It should contain not less than 1.9 percent. of anhydrous Caffeine, as determined by the method given below. Assay: Dissolve about 5 Gm. of Effervescent Citrated Caffeine, accurately weighed, in 10 Cc. of hot distilled water. When effervescence has ceased, add an excess of sodium hydroxide T. S., cool the mixture and shake it in a separator with three successive portions of 20 Cc., 10 Cc. and 5 Cc., respectively, of chloroform, or more if necessary to complete the extraction. Evaporate the combined chloroform extracts on a water-bath and dry the residue to a constant weight at 80° C. The weight obtained is that of the anhydrous Caffeine in the weight of Effervescent Citrated Caffeine taken. The Caffeine so obtained should respond to the identity tests and have the melting point given under Caffeina.

Collodium.—No change in formula. Modified directions: Add the alcohol to the pyroxylin in a suitable bottle, shake the mixture thoroughly, then introduce the ether, and again shake the mixture until the pyroxylin is dissolved. Formerly the ether was added to the pyroxylin, the mixture allowed to stand 15 minutes, the alcohol added and the bottle shaken until solution resulted. Added description and tests: A clear, or slightly opalescent, syrupy liquid; colorless, or slightly yellowish; having the odor of ether and highly inflammable. Exposed to the air in a thin layer it leaves a transparent, tenacious film. Specific gravity 0.765 to 0.775 at 25° C. When mixed with an equal volume of distilled water, a viscid, stringy mass separates; the mixture should not show an acid reaction with litmus. Assay: Weigh accurately about 10 Cc. of Collodium in a well-stoppered flask, warm it on a water-bath and add 10 Cc. of distilled water, drop by drop, with constant stirring. Evaporate the mixture on a water-bath and dry the residue to constant weight at 110° C. The pyroxylin so obtained should correspond to

not less than 5.1 percent. of the Collodion taken, equal to about 4 Gm. of pyroxylin in 100 Cc. of Collodion at the standard temperature. The pyroxylin obtained should burn rapidly, with a yellow flame.

Collodium Cantharidatum.—No change in formula. No material change in directions.

Decocta.—Added directions: "Decoctions shall be freshly prepared from the drug, etc."

Emulsum Olei Morrhuae.—No change in formula. No material change in directions.

Emulsum Olei Terebinthinæ.—New formula. Rectified Oil of Turpentine 15 Cc.; Expressed Oil of Almond; 5 Cc.; Syrup, 25 Cc.; Acacia, in fine powder, 10 Gm.; Water, a sufficient quantity to make 100 Cc. Mix the Rectified Oil of Turpentine with the Expressed Oil of Almond; rub the Acacia, contained in a dry mortar, with the oils until uniformly mixed; then add at once 15 Cc. of water and triturate lightly and rapidly until a thick homogeneous emulsion is produced; to this add the Syrup, with enough water to make the product measure 100 Cc. and mix thoroughly.

Glyceritum Acidi Tannici.—No change in formula. Modified directions: Weigh the glycerin into a suitable tared, wide-mouthed bottle, place it in a water-bath of cold water and apply heat until the water boils for a few minutes. Discontinue the heat, add the Tannic Acid to the hot glycerin in small, successive portions, and agitate the mixture until the Tannic Acid is dissolved. Former directions required trituration of the Tannic Acid with glycerin, followed by heating in a dish on a water-bath until dissolved.

Infusa.—Added directions: "Infusions shall be freshly prepared from the drug, etc."

Infusum Digitalis.—Added requirement: "Infusion of Digitalis should be freshly prepared."

Linimentum Ammoniacæ.—Ammonia Water, 250 Cc., Oil of Sesamum, 750 Cc.; to make 1000 Cc. Agitate the Ammonia Water with an equal volume of the Oil until a uniform mixture is obtained, then gradually add the remainder of the Oil and mix well. Ammonia Water changed from 350 Cc. to 250 Cc. Oil of Sesamum replaces the alcohol, cotton seed oil and oleic acid.

Linimentum Camphoræ.—No change in formula. The directions require to heat the Oil in a suitable flask or bottle on a water-bath, add the Camphor, stopper the container and dissolve the Camphor by agitation without further heat. The Camphor was formerly dissolved in the Oil in a loosely-stoppered flask, on a water-bath with occasional agitation.

Linimentum Saponis Mollis.—No change in formula. No material change in directions.

Linimentum Terebinthinæ.—Added directions: "If thickened by cold, the Liniment should be warmed sufficiently to render it fluid before dispensing, otherwise no change in formula or directions."

Massa Hydrargyri.—The Mercury is added to 1 Gm. of Oleate of Mercury in a warm mortar, a small amount of Honey of Rose added and the Mercury extin-

guished in the mixture. The other ingredients are subsequently incorporated to make a uniform product. The Oleate of Mercury was not in the formula of the Eighth Revision.

Mistura Glycyrrhizæ Composita.—No change in formula. The Extract and Acaciâ are directed to be dissolved in warm water; the former text did not specify that it should be warm.

Mucilago Acaciæ.—The amount of Acacia is changed from 340 Gm. to 350 Gm., the lime water omitted and distilled water directed to make 1000 Gm. No material change in the directions.

The former solvent acetone is changed to ether in the following:

Oleoresina Aspidii

Oleoresina Zingiberis

Oleoresina Capsici

Oleoresina Piperis

Pulvis Aromaticus.—No change in formula or directions. Added microscopic descriptions: Light reddish-brown; with a strong, distinct, aromatic odor; consisting chiefly of the characteristic starch grains of Ginger, being ellipsoidal or ovoid, slightly beaked and from 0.005 to 0.060 mm. in diameter; numerous yellowish-brown, brownish-red and occasional blackish fragments, the cellular structure of which is not distinct; occasional stone cells, the lumen being filled usually with a reddish-brown amorphous substance or containing air; occasional fragments with sclerenchymatous fibers; calcium oxalate crystals; short raphides few.

Pulvis Glycyrrhizæ Compositus.—No change in formula or directions. Added microscopic description. Greenish-yellow to greenish-brown with an odor suggesting that of fennel; when mounted in water or hydrated chloral T. S. and examined under the microscope Compound Powder of Glycyrrhiza shows fragments of Glycyrrhiza with their characteristic yellow fibers associated with crystal-fibers, large tracheæ with elliptical, bordered pores and cells containing numerous, spherical starch grains varying from 0.002 to 0.020 mm. in diameter; also fragments of Senna as shown by their characteristic, more or less bent, unicellular, non-glandular hairs from 0.100 to 0.350 mm. in length; fragments of epidermis with elliptical stomata and their 2 neighboring cells and fragments with crystal-fibers; upon the addition of potassium hydroxide T. S. to aqueous mounts of the powder, some of the fragments are immediately colored a yellowish-red, changing to a reddish-brown. Add 0.100 Gm. of Compound Powder of Glycyrrhiza to a test-tube, moisten it with 2 Cc. of alcohol and then add 10 Cc. of water and boil, allow it to cool and then filter, the filtrate should be of a pale yellowish-brown color, which changes immediately to a yellowish-red on the addition of a drop of potassium hydroxide T. S. Compound Powder of Glycyrrhiza should be free from an odor of hydrogen sulphide.

Pulvis Ipecacuanhæ et Opîi.—No change in formula or directions. Added microscopic description: Grayish-white or very light brown; consisting mostly of coarse, angular, frequently more or less cone-shaped, colorless fragments from 0.030 to 0.400 mm. in length; very slowly soluble in water and hydrated chloral T. S., and which strongly polarize light with a strong display of colors (fragments of sugar of milk); numerous starch grains of Ipecac, their presence con-

firmed by the addition of iodine T. S., and varying from 0.003 to 0.017 mm. in diameter; occasional fragments of tracheids of Ipecac; and occasional fragments with the more or less tabular, characteristic stone cells of the capsules of the Opium Poppy, with their light brown, porous and strongly lignified walls.

Pulvis Jalapæ Compositus.—No change in formula or directions. Added microscopic description: Very light brown; consisting of numerous, sharp-angular, colorless fragments mostly somewhat rectangular and with straight edges varying from 0.030 to 0.300 mm. in length, slowly soluble in water or hydrated chloral T. S. and which strongly polarize light with a strong display of colors, (fragments of crystals of potassium bitartrate); numerous starch grains of Jalap, readily distinguished without the use of iodine T. S., usually single, occasionally 2- to 3-compound, and varying from 0.003 to 0.035 mm. in diameter; occasional fragments of laticiferous vessels and parenchyma with yellowish-brown walls, or tracheæ with bordered pores, and rosette aggregates of calcium oxalate from 0.010 to 0.035 mm. in diameter, that occur in Jalap.

Pulvis Rhei Compositus.—No change in formula or directions. Added microscopic descriptions: A pinkish-white, mobile powder, becoming darker on exposure to air; consisting of fine particles of magnesium oxide, numerous starch grains and characteristic fragments of vegetable tissues; starch grains of Ginger, more or less elliptical or ovoid, frequently with a prominent beak, from 0.005 to 0.060 mm. in diameter; starch grains of rhubarb, single or compound either spherical or polygonal, often with a central cleft, from 0.002 to 0.020 mm. in diameter; mounts made with hydrated chloral T. S. show a strong effervescence and more clearly, the fragments of reticulate trachea, the reddish-brown parenchyma of rhubarb with numerous small starch grains or rosette-aggregates of calcium oxalate, varying from 0.050 to 0.100 mm. in diameter; with solutions of the alkalies many of the fragments become of a deep red color.

Suppositoria.—Added general directions: If the process of cold compression is preferred, mix the medicinal substance in a suitable mortar with about an equal weight of grated Oil of Theobroma, as above directed, then thoroughly incorporate it with the remainder of the Oil of Theobroma, previously finely grated, chilling the mortar, if necessary, to preserve the pulverulent form of the mixture. Insert the powdered mass into the cylinder of an appropriate suppository compressor and by the use of this apparatus prepare the desired number of compressed suppositories.

Suppositoria Glycerini.—No change in formula. Add to the directions that the dish in which the reaction occurs be thoroughly immersed in the boiling water of the bath with the contents protected as much as possible from the steam.

A COLORIMETRIC METHOD FOR THE DETERMINATION OF CITRAL IN EXTRACTS OF LEMON AND IN OIL OF LEMON.

L. D. LITTLE, PH. G., STRYKER, OHIO.

There have been various methods suggested and worked out for the assay of Citral in Extract of Lemon and for Oil of Lemon, gravimetric as well as colorimetric. Of the methods so far suggested, the Hydroxylamine, Fuchsin Sulphite, Sulphanilic Acid, Phenylhydrazine, Metaphenylenediamine methods, all seem to have some objectionable or uncertain features which make them not uniform in results in the hands of many operators.

The Fuchsin Sulphite method of Dr. Chace, (Jour. Amer. Chem. Soc., 28, 1472, 1906), has received the most attention by chemists working with citral extracts.

The Metaphenylenediamine method of Mr. Hiltner, (Jour. Ind. & Eng. Chem, 1906), which is generally preferred at the present time has good features for convenience and rapidity in manipulation, and can be conducted at room temperature.

As is well known to chemists working with citral, it possesses the characteristics of the aldehydes, and as it combines with phenylhydrazine, with ammonia and with hydroxylamine, upon these all colorimetric methods have been based. The following have been suggested:

The fuchsin sulphite reagent which was primarily used for the determination of acetaldehyde in alcohol, etc.; and metaphenylenediamine hydrochloride which is used in the fuchsin method for the decomposition of acetaldehyde in the alcohol used in the Chace method; therefore the two methods may give higher results in an extract of lemon containing acetaldehyde, which would be calculated as citral, while with the diaminophenol hydrochloride reagent only the citral is estimated, as this compound does not react with acetaldehyde and, as far as I have been able to determine, does not react with other compounds present in oil of lemon, except that in the presence of citronellal a violet coloration is produced proportionate to the amount of citronellal present. Of the various reagents suggested for the colorimetric estimation of citral aldehyde they bear a similarity in containing an "amino" group which combines with the citral.

In phenylhydrazine C_6H_5, NH_2, NH, HCl we have one amino and one imino radical.

In fuchsin

we have three amino groups.

In metaphenylenediamine hydrochloride, $C_6H_4(NH_2)_2, 2HCl$ there are two amino groups.

In hydroxylamine hydrochloride, NH_2, OH, HCl there is one amino group while in diaminophenol hydrochloride, $C_6H_3(NH_2)_2 OH, HCl$ there are two

amino groups, which appear to combine readily with citral and evidently form a definite compound, the product of which I have not fully worked out but have under investigation.

The following colorimetric method I have used for the past year in making Citral determinations parallel with other methods, with concordant results.

The method is of easy manipulation and can be conducted at room temperature:

Reagent: Dissolve .200 gram diaminophenol hydrochloride, (commercially known as Amidol) in 100. cc. of 65 percent by volume alcohol, preferably distilled over potassium hydroxide. The use of aldehyde-free alcohol does not seem to make any difference in the results, as acetaldehyde has no apparent effect upon the reagent. I find in making a large number of assays for citral the use of Mallinckrodt's recently distilled absolute alcohol to be sufficiently exact, as the reagent remains clear and colorless for several hours. The reagent is very readily soluble in 65 percent alcohol.

Standard Citral Solution: A solution of pure citral in fifty percent alcohol, containing .001 gram per cc.

Solution of Extract of Lemon: Weigh any quantity of the extract for examination, 15 or 25 grams, and dilute to 30 or 50 cc. with 50 percent alcohol, if a terpeneless extract, making a 50 percent solution.

Manipulation: Similar to the Chace method, except that it can be conducted at room temperature.

Place 2 cc. of the standard citral solution measured from an accurately graduated pipette, in a 250 mm. colorimeter tube, (using preferably an O. Schreiner colorimeter) add 20 cc. of 65 percent alcohol, and 15 cc. of diaminophenol reagent and make up to 50 cc. with 65 percent alcohol. Place 2 cc. of the extract in the other tube with 15 cc. of the reagent and make up to 50 cc. with 65 percent alcohol as before, mixing the contents of both tubes thoroughly and allowing both tubes to remain for 5 to 10 minutes at room temperature, when the maximum color is reached in both the citral tube and the extract under examination. The reading and calculation are made at once or a reading can be made at the expiration of fifteen or twenty minutes in duplicate. The calculation of percentage of citral content in the extract is made by placing the standard citral tube at the 30 mm. mark and adjusting the tube containing the extract under examination so that the two small disks of color as observed through the two immersion tubes are similar in tint.

Assuming that the extract tube was at 40, the calculation of percentage is made as follows: $30 \times 2 \div 40 = 0.150\%$.

The form of colorimeter which I have used is a modification of the O. Schreiner Colorimeter, which has some conveniences in manipulation over the ones obtainable from the instrument supply houses. The two immersion tubes are placed in the holders about 13/16 inch apart and adjusted parallel with each other, and the two mm. graduated tubes are attached to two movable slides at the back of the instrument, and movable upwards or downwards by a rack and pinion adjustment which moves them in a parallel position. In front of the

frame, covering the tubes while under observation, is a hinged front inclosing the tubes in a black box open at bottom, thus excluding all side lights or reflections.

The observation mirror at top instead of being made with a flat plane surface is divided in the center and mounted backwards at center, at an angle of about 3° or about 1/12 inch for each two -inch piece, making the mirror four inches in length, which converges the rays of light through the tubes and brings both images within the line of optical axis.

For the assay of oil of lemon the following is suggested as giving very good and comparative results. Dissolve 1 gram of the oil in sufficient 85% alcohol to make 20 cc. of solution and filter clear. Eighty-five percent alcohol will have about the same density as the oil. Make a 50% solution. Weigh out 15 grams and dilute to 30 cc. with 85% alcohol, or make a solution of 1 gram of the oil with sufficient 85% alcohol to make the volume 40 cc., and assay.

In the following tables I give the results of examination of both terpeneless extracts and extracts made from oil of lemon, covering a period of two years,

in parallel with Chace and the Hiltner methods and with diaminophenol hydrochloride:

TABLE No. 1.

		Chace Method.		Diaminophenol Method.

While extreme accuracy is not claimed for the above method it is submitted with the hope that it may be of assistance to the pharmacist or chemist in making a comparative estimate of value or citral content of Extract of Lemon or Oil of Lemon for which it is given.

THE DETECTION OF ADDED METHYL SALICYLATE.*

WITH SPECIAL REFERENCE TO A NEW COLOR TEST AND THE CLAIM OF UNITED STATES GOVERNMENT CHEMISTS TO HAVE DEVISED A METHOD.

The article which appeared in the Record of January, 1914, page 4, on the above subject has brought us so many inquiries and communications that we think it well to make further reference to the matter, especially as considerable interests are involved.

It will be recollected that it was claimed that the "specialists" of the Bureau of Chemistry are able to detect the addition of synthetically manufactured methyl salicylate in the natural product. We pointed out the importance of this, especially in view of the difficulties which previous workers had experienced in the task.

*Reprinted from Perfumery and Essential Oil Record, Feb., 1914, p. 60.

We are informed that all applications to the United States Department of Agriculture for particulars of the test have been met with the statement that the test used is under further investigation, and will be communicated by the Department in due course. We presume that there is some reticence, as the test has been used in connection with legal proceedings under the Food and Drugs Act.

We have been experimenting continuously since our last publication, and suggest that a test which may be eventually found to be useful is a color test, which so far as our observations have gone appears to be of some reliability. We have employed the test upon what we have every reason to believe to be true oil of *Gaultheria procumbens*, true oil of *Betula lenta*, oils, about which we have certain suspicions, and upon methyl salicylate. As, however, is usual with all color tests, they must be accepted with reserve, and it is absolutely essential that identical conditions should obtain in every test.

The application of the test as we have made it has been on the following lines:

"To five drops of the oil in a test tube add five drops of a 5 percent alcoholic solution of vanillin and 1 cc. of alcohol. Shake well and add 2 cc. of concentrated sulphuric acid and mix thoroughly."

The following table indicates the results of our examination of typical samples, which we have described above:

Oil of <i>Gaultheria procumbens</i>	Intense crimson
Oil of <i>Betula lenta</i>	Deep blood red
Doubtful (a)	Reddish brown
Doubtful (b)	Reddish brown
Methyl salicylate (synthetic)	Yellow

By this intensity of coloration there can be no question that one can see a difference between oils that are pure and oils that are grossly adulterated, but whether it can be made into a colorimetric test is, of course, difficult to say. One remembers only too well how that the intensity of color produced by the action of sulphuric acid on cod liver oil, namely, the dark violet coloration, was used by a public analyst as an indication of the freedom or otherwise of the cod liver oil from certain other added fish oils.

We make no further comment until we are favored with full particulars of the "official" test, but, at the same time, one can see that it is important that a publication should be made as promptly as possible, especially if the test is to be thoroughly investigated before its inclusion in the new United States Pharmacopœia.

INFECTION AND IMMUNITY—A REVIEW.

N. S. FERRY, PH. B., M. D., RESEARCH LABORATORY, PARKE, DAVIS & CO.,
DETROIT, MICH.

1. CONDITIONS OF INFECTION. Infection is the successful invasion of the body by living parasites. The broader sense of the term, however, conveys to our minds, not only the process of invasion and multiplication of the micro-organisms, but also the results of their specific functions upon the tissues of the body, the pathological process. Infection, therefore, results from the entrance into the body of living, pathogenic micro-organisms, and its symptoms or manifestations depend upon influences relative to invading micro-organisms as well as the body which they invade. Anything modifying either the micro-organisms or the host must necessarily have its effect upon the final result. There are, therefore, many conditions, some of which are recognized, that control, to a certain extent, infectious or diseased processes.

Infecting Agent. The conditions which modify infection, as regards the infecting agent, are *virulence*, the *number of micro-organisms gaining entrance to the body* and the *mode of entrance*.

Virulence may be defined as the power of micro-organisms to multiply within the body and produce disease. If the virulence is increased, if in some way the power of a certain micro-organism to produce a specific disease is intensified, then the dose or the number of invading micro-organisms need not necessarily be so large to produce a like infection. We have, at present, very little knowledge of Nature's way of modifying the power of micro-organisms to produce disease, although in the laboratory, under experimental conditions, we may increase and decrease their virulence by several methods. The most common methods of increasing the virulence, are by passing a pure culture of a pathogenic micro-organism through an animal, growing the organisms upon culture media containing unheated body fluids, such as blood, serum or ascitic fluid, or in a collodion sac within the body cavity of an animal. The value of these methods depends upon the fact that the micro-organisms, while developing, come in contact with some of the properties derived from the living animal, and, therefore, approach Nature as closely as possible. The virulence of the virus of rabies is increased by passing it successively through rabbits, as is also the case of many known bacteria, as the pneumococcus, streptococcus and others. The virulence of the glanders bacillus, the diphtheria bacterium and other micro-organisms are strengthened by passage through guinea pigs. On the other hand, the virulence of micro-organisms may be decreased by removing them from their natural environment and regular source of food supply and growing them on artificial culture media. It is found, as a rule, that under these conditions the growth of the micro-organisms will gradually become more luxuriant at the expense of their virulence.

There are occasions, however, when the virulence of an organism or virus is decreased on passing through an animal. While the virus of rabies will increase

on passing through rabbits, it decreases on being passed through monkeys. This is well illustrated by the smallpox virus, which presumably decreases its virulence by passing through a heifer, and we have as a result a much milder infection. We cannot state this as an absolute fact, as the nature of the virus of smallpox or cowpox is unknown. By making use of the cowpox virus, or the smallpox virus in its altered state, we have a means of protecting against the disease in its natural state, as the smallpox vaccine will immunize against either smallpox or cowpox.

Under ordinary conditions, given the dose large enough, and the organisms virulent enough, to produce a specific infection, the results will depend, in a large part, on the path taken by the invading micro-organisms. The portals of entry, or the paths by which micro-organisms gain entrance to the body, are the broken skin, the digestive tract, the respiratory tract, the genital tract and the conjunctiva. Many of the causal organisms of the acute infections are very selective in their methods, producing their specific diseases only when allowed to enter the body by certain paths. The typhoid bacillus as well as the cholera spirillum have chosen the alimentary tract as their portal of entry, and will infect the individual in no other way. The gonococcus elects the urogenital mucous membrane, or the conjunctiva, and there is no evidence at hand to prove that specific symptoms may be produced through the skin, alimentary tract or respiratory tract. The tetanus bacillus produces its deadly results through the broken skin or mucous membrane, while the diphtheria bacterium prefers the mucous membranes of the pharynx, and is seldom found in any other situation.

Subject of Infection. Pathologic bacteria are rather underhanded in their methods of warfare for, although they are ever present, they rarely attack the body unless its natural defenses and protections are disabled or broken down; or, as we say, the resistance is lowered and the individual is susceptible. In this case, the normal equilibrium being in some way disturbed, the dormant but virulent micro-organisms, taking advantage of the situation and rapidly increasing in number, produce the infection. Susceptibility or lowered resistance, or in other words, imperfect or impaired reactive powers, are, as a rule, brought about by one or more of the following conditions: fatigue, exposure to cold, heat or dampness, poor hygiene, noxious gases, drugs, trauma and operation, other diseases, improper diet, thirst and age. How these various conditions affect the normal defenses of the body we are at a loss to explain.

2. VARIETIES OF INFECTION. The results of the growth of pathologic bacteria within the body manifest themselves in an infinite variety of ways. After the micro-organisms gain entrance to the body, they may remain at or near the point of entrance, or may find their way—by means of the blood stream, lymph channels or contiguous tissues—to some remote spot; in either situation they may multiply and produce an infection. This form of infection is termed local, and may be either acute or chronic, depending upon the length of time the morbid process has continued. Cerebrospinal meningitis, diphtheria, tetanus, the early manifestations of gonorrheal infection, as well as the ordinary pus infections, are typical local infections.

A general infection, on the other hand, is one in which the micro-organisms are found disseminated throughout the entire system. This is termed a bacteremia

or a septicemia. Typhoid fever and pneumonia are typical general infections. The primary focus of the infection is to a certain extent localized (in the lungs in pneumonia and in the intestines in typhoid), but the bacteria may be isolated, in the majority of cases, from many of the internal organs as well as from the blood stream. This condition must be distinguished from that of diphtheria and tetanus (the toxemias), in which case, although the infection is localized, the toxins and not the bacteria are found diffused throughout the system, the symptoms resulting from the action of these toxins alone. It is impossible to draw a sharp line between the local and general infections, or the bacteremias and toxemias, for in many of the local infections blood cultures may show the casual organism in the circulating blood stream, and in all infections, both local and general, there is always some general intoxication produced.

A primary infection is an original or initial infection, which is often followed by a secondary. It is, as a rule, the principal infectious process, invading the body at one time, although it may prove not to be the one to cause the death of the individual.

A secondary infection is a condition found when some other infectious process is implanted upon or associated with a primary infection. Secondary infections are usually caused by the pus organisms. When the susceptibility of the body, due to its lowered resistance, following the primary infection, is increased, the secondary organisms, which may have been present in the normal body in a quiescent state, begin to multiply, and cause symptoms typical to themselves.

Mixed or concurrent infections occur when two or more different bacterial species are found associated. Acute rhinitis, an ordinary "cold in the head," as it usually manifests itself, is a typical example of a mixed infection.

Terminal infections are found in the chronic organic diseases; as, heart disease and Bright's disease. In such cases, one or more pathogenic micro-organisms gain entrance to the body, and, encountering no resistance, due to the already decreased vitality of the body, multiply with great rapidity and produce death within a short time. The primary disease might have resulted fatally in time, but it is the secondary infection which terminates the case. Pneumonia is one of the most frequent terminal infections. The terms "mixed" and "secondary," or "secondary" and "terminal" are often used interchangeably, for there is no hard and fast line of distinction between them, except that a terminal infection always results in death.

3. MODES OF BACTERIAL ACTION. It is generally believed that in all infections the chief symptoms are due to the injurious nature of the products formed by the bacteria, and not to the invasion of the bacteria alone. In many cases, however, the intoxication is absolutely dependent upon the invasive power of the micro-organisms, and unless this is strong enough to overcome the resistance of the body, infection will not result. On account of the poisonous nature of these products they are termed toxins. These toxins are presumably of two classes, the extracellular or exotoxins (diphtheria, tetanus), and the intracellular or endotoxins (typhoid, pneumonia and others). A few bacteria, such as the tetanus bacillus and the diphtheria bacterium, with very limited invasive powers, eliminate highly active specific toxins, which produce typical symptoms of the disease, even when separated from the bacteria. These toxins may be found in solution

in the liquid culture media containing the growing micro-organisms, or in the body, after being formed by the bacteria; in which case they enter the circulation and act upon parts of the body remote from the bacteria themselves. The symptoms of the diseases are due to the toxins. Unlike ordinary chemical substances, most of the true toxins act only after a definite length of time, or incubation period. Other varieties of micro-organisms, with invasive powers less limited than the former, may be found growing in some localized area, but exciting actively destructive reactions in the tissues with which they come in contact. These are the staphylococci, streptococci, gonococci, meningococci, and others. Still another variety may be found either in a limited invasion, or in a general infection where the severe symptoms are also due to toxins, as in pneumonia, typhoid fever, and cholera. Lastly, we have a variety of micro-organisms that depend entirely upon the general invasion before the toxin can produce the injurious symptoms, as with the anthrax bacillus. The toxins, however, in all of the last three varieties are endotoxins. They are not found in the culture media in which the organisms grow, are isolated with difficulty from the micro-organisms, and then only after their death, and do not produce symptoms of the specific disease if injected subcutaneously or otherwise, although they may produce severe symptoms and even death. The toxic power of these bacteria is intrinsic, and is dependent in great part upon their invasion.

4. NATURAL DEFENSES OF THE BODY AGAINST THE INVASION OF MICRO-ORGANISMS. Nature, with its unlimited resources, has endowed the human body with many wonderful and varied devices and means for defending and protecting itself against the invasion of micro-organisms, and for neutralizing the deadly poisons as they are formed during the growth of these bacteria within the body.

The External Defenses. For preventing the bacteria from entering the body we have the skin and mucous membranes. On those parts most exposed to injury, such as the soles of the feet and palms of the hands, we find the epidermis or cuticle much thicker and tougher than in other parts. The bacteria gain entrance through these parts only by means of an injury to them. For those parts of the body that are not so much exposed to external influences, and, on account of their situation it is necessary that their surfaces rub together continually, nature has provided a lubricant to prevent them from erosion. The lubricants are the products of the secretions from the salivary, the gastric, the lacrimal, the mucous, and the serous glands. Aside from the protection afforded by the lubrication of the surfaces, as well as an aid in washing away the bacteria, these fluids have, to a certain extent, germicidal or at least antiseptic properties. Under normal conditions, the pathogenic micro-organisms, if not killed, are checked in their growth, and often prevented from multiplying and producing disease. We are still in the dark as to the nature of these antiseptic properties. We do know, however, that although we are unable to use any of the ordinary disinfectants on these surfaces, operations upon the eye, mouth, stomach or anus are rarely followed by infection due to entrance of bacteria at the field of operation. The respiratory tract, which is constantly invaded by foreign particles, as dust, coal and other debris, carrying many hundreds of bacteria with them, is protected, not only by the mucous of the lining membrane, but also by little hair-like processes called cilia. These are continually moving in one direction,

making it possible for any foreign particles, which may lodge upon the surfaces, to be gradually swept away from the lungs toward the exterior of the body.

The Internal Defenses. A study of the internal defenses of the body brings us at once to the subject of immunity. Immunity is that condition of the body whereby it resists the development of infectious or morbid processes. The external defenses oppose the entrance and retard the invasion of micro-organisms; while the internal defenses resist their development, or protect the body tissues against their poisonous products, if, by chance, the micro-organisms manage to find their way past the external defenses. As we are dealing with the products of bacteria (toxins) as well as the bacteria themselves, we must distinguish between an antimicrobial and an antitoxic immunity. One is an immunity to an infection, while the other is an immunity to an intoxication. An individual may possess an immunity to a certain micro-organism or to its toxin, or both, but the possession of one property does not necessarily imply the possession of the other. The inoculation of an animal with a large number of *Bacterium diphtheriæ* will not necessarily cause the appearance of unfavorable symptoms, although the injection of a very small quantity of toxin eliminated by the same strain of organisms invariably means death. On the other hand, an animal might be immunized against the endotoxin of a virulent strain of an organism such as the pneumococcus, and at the same time succumb to the injection of a small number of the live organisms.

From an early period in the history of immunity, there has been a tendency for investigators to be divided into two schools relative to the methods pursued by the body in protecting itself against the ravages of pathogenic micro-organisms; one dominated by the idea that the body fluids are chiefly concerned (the "humoral" view), the chief supporter of which is Ehrlich; the other, championed by Metchnikoff, attributing the most important role to certain cells of the body (the cellular view). More recent work has shown that these views are not necessarily antagonistic, but that both seem to have their part to play in the study of the processes of immunity, and one cannot be accepted to the exclusion of the other. Both have their faults, and yet both are founded on certain demonstrable facts.

The first attempt at an explanation which gave the slightest ray of hope to the solution of the problems of acquired resistance of the body against the invasion of foreign substances was suggested by that brilliant investigator, Metchnikoff. He studied the behavior of the white blood cells, and attributed the destruction of bacteria in the body to their activities. Others had previously noted that bacteria were at times found in these cells, but Metchnikoff made an exhaustive study of the fact, and upon this founded the Theory of Phagocytosis. The cells which took up and devoured or digested the bacteria were called phagocytes, and of these he recognized two groups—the small phagocytes or white blood cells, and the large phagocytes or cells derived from the endothelial and other tissues of the body. The small phagocytes or "microphages," as Metchnikoff termed them, seem to attempt to defend the body against the acute infectious diseases, while the large phagocytes or "macrophages" pay more attention to the animal parasites, and to the microorganisms which cause chronic infections.

Ehrlich's theory, the Side Chain Theory, on the other hand, is based on the idea

that the process of immunity is of a chemical nature; and that the antibody arises from the normal body cells, and has nothing to do with the phagocytes. He believes that the normal body cell consists of a central complex protoplasm, giving it definite and special properties. With the complex protoplasm are associated other combinations, similar to those in the benzol ring in chemistry, which have the function or property of combining with extracellular or outside material, and are called receptors or side chains. In performing the normal and every-day functions, as the assimilation and absorption of food after digestion, certain of these cells in the body have their part to play in the act. The assimilation is due to a chemical union between the receptors of the cell, on the one hand, and the nutrient material on the other, brought to them by the blood and lymph from the digestive apparatus. By means of this chemical union of a receptor and nutrient material, the protoplasm of the cell is fed. As in chemistry, in order for a certain molecule to enter the ring or to be assimilated by the protoplasm of the cell, it must be able to satisfy the affinity of some receptor; so in the every-day functions of the body the nutrient material must find its corresponding receptor, or side chain, before it can enter the cell. Ehrlich's theory, therefore, depends upon the supposition that toxins or poisons, like food or nutrient material, can combine with certain receptors and then enter the cell and destroy it. Ehrlich found that the property of the diphtheria toxin to combine with the antitoxin was constant, while the property of producing disease was variable, and from this was led to believe that the toxin molecule had two parts or groups—the toxic part or toxophore group, and the non-toxic part or haptophore group. He demonstrated, also, that the toxin molecule combined with certain cells, by means of this haptophore group attaching itself to the receptor of the cell. The haptophore group, therefore, is the link which attaches the toxic part of the toxin molecule to the receptor or side chain of the cell, and without it the toxin molecule would have no effect whatever upon the cell. The haptophore group, or combining group, is always constant; while the toxophore group, or disease-producing group, is variable. If the toxin, after attaching itself to the cell, damages it to any great extent, it causes the cell to die. If enough of the cells are thus damaged, the body as a whole is overcome by the poison and fatal results follow. On the other hand, if the cell is lightly affected, as is found in producing artificially active immunity, the cell in losing one receptor proceeds at once to generate and produce others. In this process of regeneration there is an overproduction of these receptors, which are cast off into the system, and find their way to the blood stream, lymph channels and possibly the tissue juices. Although these receptors are cast off from the cells, they are still able to combine with the toxin molecule. The cast-off receptors or side-chains are the antibodies or antitoxins, and by combining with toxin, either in another animal body or in the test tube, will neutralize it and produce a chemically inert substance. The receptor, therefore, becomes an antitoxin as soon as it is cast off, but not until then. These receptors may remain in the individual or animal in which they are formed, and continue to protect the body. This is the active immunity we see following infectious diseases and called naturally acquired immunity, or following forced immunity, as seen in an animal immunized against diphtheria toxin or the tetanus toxin, called the artificially acquired immunity. These receptors

may be transferred to another animal body, producing a condition recognized when an individual is injected with antitoxin, either for prophylactic or curative purpose, called passive immunity. In order to satisfy other conditions of immunity, Ehrlich found it necessary to distinguish three orders of receptors. The side-chain theory, in fact, is built up on such an ingenious plan that almost any condition imaginable in immunity may be accounted for by producing other orders of receptors. In the first order we find the simple receptor, which combines with the haptophore group of the toxin molecule. In this order are placed the anti-toxins. Agglutinins and precipitins are included in the receptor of the second order, and the cytolytins, including the bacteriolysins, are of the third order.

5. IMMUNITY. We will first divide immunity into Natural, Inherited and Acquired. Natural immunity is the inherent, innate insusceptibility to disease. It is difficult, therefore, according to our present knowledge, to discriminate between natural and inherited immunity. It is a well known and recognized fact that certain species, races and individuals, under apparently the same conditions, are very resistant to some infections, and that others are extremely susceptible to the same infections. Typhoid fever, cholera, diphtheria, scarlet fever, measles, whooping cough, mumps and other diseases occur in man only; animals are naturally immune. Some of the diseases which are found in animals alone are hog cholera (swine), contagious pleuropneumonia (cattle), equine influenza (horses and mules), and blackleg (sheep and heifers). Diseases common to both man and animals are tuberculosis, anthrax, glanders, pyemia, tetanus, plague, actinomycosis, cowpox and many others. There are also exceptions to these. The goat and dog are considered naturally immune to tuberculosis. While ordinary sheep are susceptible to anthrax, Algerian sheep are resistant. Rats are immune to anthrax, while most birds are susceptible. Snake venom is extremely poisonous to both man and animals, with one exception; hogs are immune. The field mouse is very susceptible to the glanders bacterium, while the white mouse is immune. Another very interesting fact which may be considered an example of natural immunity is found in the mosquito. The *Culex* does not harbor the parasite of malaria, while the *Anopheles* is its common host. The ability to transmit yellow fever is limited to one particular species of mosquito, the *Stegomyia calopus*. Individual differences in immunity, or the natural power of resistance under similar existing conditions, occur every day. In an epidemic of typhoid fever, due to a contaminated water supply, some individuals become infected while others do not; and this may occur in the same family. Again, with whooping-cough, scarlet fever, measles or any of the acute contagious diseases of childhood, one of the children in a family may become infected, while the others will remain well. The immunity is oftentimes carried through the lifetime of the individual.

Acquired Immunity. An acquired immunity is that form of immunity gained by a susceptible individual during the life of that individual. It differs from the natural immunity, in being less certain and having a variable duration. We have two varieties of acquired immunity—naturally acquired and artificially acquired.

Naturally Acquired Immunity. Naturally acquired immunity is established

as the result of the spontaneous cure of an infectious disease. This is termed by some accidental infection.

Recovery from some of the acute infectious diseases confers a lifelong immunity to the individual, while an attack of others results in a decreased resistance. Smallpox, scarlet fever, typhoid fever, measles, whooping-cough, mumps and other infections produce an immunity which is, as a rule, lasting; although a few cases are recorded of a second and even a third attack, as the length of the immunity does not depend upon the severity of the infection. On the other hand, pneumonia and influenza not only do not produce an immunity, but usually render the individual more liable to subsequent attacks. Some diseases, therefore, produce an increased resistance, while others an increased susceptibility.

Artificially Acquired Immunity. Artificially acquired immunity is produced by intentional inoculation. This may be either for experimental or therapeutic purposes, but always with some definite end in view. This sort of immunity may be active or passive.

Active Immunity. In the active form, the immunized individual gains its power of resistance by the unaided reaction of its own tissues, or in other words, it manufactures its own antibodies. In every case the immunity depends upon specific reactions on the part of the cells and tissues of the individual. The best example of this form of immunity is illustrated in the horse which has been immunized with diphtheria toxin to produce the antitoxin. The animal is injected with a dose of toxin not large enough to prove fatal, but toxic enough to produce a reaction. The horse becomes ill and recovers, the symptoms lasting but a few days. This process is repeated until the animal is able to stand an amount of toxin many hundred times the fatal dose. After the first injection something has changed in the animal, for it will not again react in the same way to the same dose. The cells or tissues of the body have acquired a new property by their own physiological activity, and this is termed active artificially acquired immunity. Such immunity is always gained at the expense, and often at the risk, of the individual acquiring it. There are many different ways of producing this form of immunity. It may be produced either by means of the bacteria themselves or their products. Experimentally we may use the live virulent, the attenuated, or the dead bacteria, but therapeutically the live virulent bacteria are not injected into the body on account of the danger attendant upon such treatment. Wherever possible, for prophylactic purposes, the attenuated organisms are preferable to the dead, because the symptoms are the result of a mild infection, calling forth more of a specific reaction on the part of the tissues and cells of the body, thereby resulting in a more lasting immunity. In preparing these attenuated organisms for the production of active immunity, the more of their natural characteristics they are allowed to retain, with safety to the patient, the more potent will be the result.

Micro-organisms may be attenuated by mechanical or natural means. The mechanical methods are heat, chemicals, desiccation and dialysis. The organisms are washed or scraped off the solid culture media, are thrown down by centrifugation from the liquid culture media or else are taken as they grow in the liquid culture media and are heated just enough to retard their growth or diminish their virulence. The tissues of the animal body in which the bacteria

are growing may be allowed to undergo the same treatment. A typical example of an attenuated product of this last sort is blackleg or symptomatic anthrax vaccine. Subjecting the bacteria in a similar manner to certain chemicals or their fumes may produce the same results. We may also attenuate bacteria, while still growing in the culture media, by subjecting them to heat or chemical influence as in the production of Pasteur Anthrax Vaccine. In growing under these artificial or unnatural conditions, some sort of a change takes place in the micro-organisms. They become less virulent, and when injected, the resulting symptoms are atypical of the disease. The Pasteur vaccine for rabies is attenuated by desiccation. Whether this is in fact an attenuation of the organism or merely a dilution of the virus caused by the death of many of the organisms is a question. We may also attenuate or modify a virus by dialysis. In this manner the immunizing substance, whatever it may be, is allowed to remain intact at the expense of the toxin part of the virus which is apparently dialyzable. The natural method of attenuation is by passing the micro-organisms through certain animals. This is rarely accomplished, but it has been done, as in the case of the passage of the rabies virus through monkeys. The gradual cessation of an epidemic after weeks or perhaps months of the most virulent types of infection is probably often the result of a natural attenuation of the causal organism.

In preparing dead bacteria for immunizing purposes, we strive to kill the micro-organisms, but not destroy their products. Among these products are the endotoxins. We heat the bacteria, or cause them to come in contact with certain chemicals in the form of solutions or gases, just to the point of stopping their growth. Heat has been the generally accepted agent for killing the bacteria used for therapeutic purposes, although suspensions of the bacteria may be made with dilute germicides, as the coal-tar products or other antiseptics, just strong enough to kill them, not to produce an injurious effect upon the therapeutic value of the vaccine or upon the patient receiving the treatment. Here again it must be borne in mind that the more injury to which we subject the organisms, one way or another, the less will be the production of immunity. Heat being recognized as antagonistic to those functions of bacteria which have to do with the production of immunity, it behooves us to use as little heat as possible in the process of devitalizing the organisms. Suspensions of dead bacteria, especially those intended for prophylactic purposes, prepared without the aid of heat, are being recognized more and more as superior to those treated according to the original method. Therapeutically these suspensions of dead bacteria are used in dilute form, and are called bacterial vaccines or bacterins. These vaccines may be used either prophylactically to prevent the invasion of bacteria, or curatively to assist nature in fighting an infection after the invasion of pathogenic bacteria has already been accomplished. It is claimed by some of the best authorities that the older the strain of organisms, the less will be their immunizing properties; therefore, those autogenetic micro-organisms isolated recently from a diseased process are considered preferable to those grown for a considerable length of time away from their natural environments. This is known not to be true for all organisms, especially the typhoid, and it may not hold for any. That the immunizing properties or toxin producing properties of bacteria do not go hand in hand with their disease producing properties is an already known fact. The best toxin

producing strain of the diphtheria bacterium with which we are familiar is known to be practically avirulent. If this holds true for the extracellular toxin producers, the same should pertain to the endocellular toxin producers. It is not necessary for an organism to be virulent and young in order to be a toxin producer, and therefore, why should it have to be freshly isolated and virulent to be an immunizer? It is also claimed that certain organisms which are allowed to remain for variable lengths of time in contact with their homologous antiserums will retain their immunizing properties while losing their pathogenic properties. The process of neutralizing the toxic properties of the organism with the antitoxin, termed sensitization, appears to attenuate the organisms without the aid of heat or chemicals.

The bacterial products, or the toxins, which are employed experimentally and practically, for the production of immunity in animals in the preparation of antisera, are the exotoxins and the endotoxins. Of the few exotoxins, only two are used to any great extent, the diphtheria and tetanus. We are unable to use these soluble toxins directly for therapeutic purposes, on account of their extremely harmful specific nature. Immunity is produced with them, as has already been explained in the case of the horse in the preparation of antitoxin serums, but this immunity is forced and at the risk of the individual immunized, so that for therapeutic purposes the treatment would be even more dangerous than the disease itself. A process somewhat analogous to sensitization of bacteria may be mentioned in this connection. It is known that active immunity may be produced by a soluble toxin as the diphtheria toxin, so long as it has been sensitized or even over-neutralized by its own antitoxin before injection. The toxic portion of the toxin molecule is neutralized or rendered inert without apparently modifying the immunizing properties. This principle, which has lately been applied by Behring to the active prophylactic immunization of the human against diphtheria, has been used in this country several years for the production of active immunity in animals, especially the horse, and was suggested several years ago by Smith for use in the human. The idea is not original with Behring. By far the greater number of pathogenic bacteria do not produce soluble toxins in the liquid culture media in which they are grown, but do liberate poisonous products, when the bacterial cells are disintegrated. These poisonous or toxic products are termed the endotoxins, and when injected into animals, immunize them to a certain extent against the invasion of the specific micro-organisms from which the endotoxins were obtained. The serum of the thus immunized animal has become antibacterial. Experiments have shown that it will kill the specific bacteria, by causing them to break up (a condition recognized as lysis) either in the animal or the test tube. It is termed a bactericidal serum with properties called bacteriolytic. Besides containing these substances which kill bacteria, the serum has been endowed with some properties which cause the bacteria to clump together or agglutinate, called agglutinins, and others which render the bacteria more readily ingested by the phagocytes, called the opsonins, and still others which produce a precipitate of the specific or homologous bacterial proteins by means of substances called precipitins.

Active immunity is produced artificially not only with bacterial toxins, but also with animal poisons, as snake venom, spider toxin and eel serum; and plant

poisons, such as those extracted from abrin, ricin, cotin and the poisonous mushrooms. From these poisons, which are soluble toxins, antitoxins may be obtained by immunizing animals with them. Of all these animal and plant poisons, snake venom is the only one used for therapeutic purposes. By means of this, an antitoxin is produced which has marked prophylactic properties against snake bites, and is used extensively in countries where the poisonous snakes abound.

Passive Immunity. Passive immunity is that form of immunity which depends upon defensive factors not originating in the animal protected, but artificially supplied to it. The protective material or antibody is furnished ready made at the risk of another animal, and, although the effect is secured at once, the immunity is only temporary. The best illustration is of that immunity produced by the injection of antidiphtheric serum. The diphtheria organisms are grown in bouillon to produce the diphtheria toxin. The horse is injected with this diphtheria toxin and becomes actively immunized to the toxin. The serum which contains the antibody, formed by the tissues of the horse, is injected into the patient suffering with the disease caused by the diphtheria organisms. The antibody is carried from the horse, by means of this serum, to the patient, who becomes immunized to the diphtheria toxin at once. The tissues and cells of the patient, therefore, are absolutely passive in the transaction, for the immunity is actually forced upon them. It is not the result of their physiological activity, hence the term passive immunity. The animal furnishing the defensive material must previously have been actively immunized. Passive immunity may be produced by injecting the following substances which contain defensive materials:

1. Blood serum of animals actively immunized by artificial methods.
2. Blood serum of animals actively immunized by natural methods.

Although the introduction, into susceptible animals, of blood serum of animals actively immunized by natural methods, such as those recovering from an infectious disease, raises their resistance to a certain degree, the immunity is not pronounced, nor is it lasting. The best results are obtained from those animals which are artificially immunized, especially in the production of diphtheria and tetanus antitoxin. The antitoxic serum is formed by the repeated injection of toxin during an extended period of time, while the quantity is pushed to the limit, so that the antitoxic strength or potency (antitoxin units per cc.) of the serum is as high as possible.

Passive immunity may be of two kinds, antitoxic and antibacterial, depending upon whether the individual was immunized with antitoxic or antibacterial serum. The antibacterial serums are not as specific as the antitoxic, and therefore, have not the same relative therapeutic value.

The antitoxic serums are the antidiphtheric and antitetanic. The antibacterial serums are antigonococcic, antimeningitic, antistreptococcic and antitubercular.

(To be continued.)

Papers Presented to Local Branches

THE LABORATORY EQUIPMENT OF THE PHARMACIST.*

HENRY B. FLOYD, WASHINGTON, D. C.

During the past six years and a half I have tried to make a study of the business methods employed by all of the pharmacists with whom I have come in contact. In addition to noting the general manner in which their business is conducted, the means each employs for the up-keep of his stock and for keeping his accounts, and how each handles his help, I have observed the facilities possessed for the carrying-on of the business in which he is engaged.

I do not wish to dwell upon what I have believed to be insufficient accounting systems or poor store methods, but will confine my remarks to the equipment and lack of equipment I have noted.

Let it be understood from the beginning, however, that I am not broaching this subject with malice or with the idea of exposing to criticism any pharmacist with whom I may have been associated.

It would seem logical, from the very nature of the business in which the pharmacist is engaged, to believe that he would possess a Pharmacopœia and a National Formulary, yet my observations lead me to assert that but two in five drug stores in the District of Columbia possess the eighth revision of the Pharmacopœia, and but one in every five can boast of the last edition of the National Formulary.

And with the conviction that I am absolutely right, I will say that but one in eight of the local pharmacies possesses both the latest Pharmacopœia and National Formulary.

This deficiency is infrequently partially made up by a dispensatory, but, as each of you well know, a dispensatory is not a pharmacopœia. Again, many druggists appear to accept Remington's Pharmacy as a substitute for the Pharmacopœia, the Formulary, and the dispensatory combined. With its peculiar arrangement, its brevity, and many necessary omissions, it makes a somewhat unsatisfactory reference work, and certainly can not be accepted in lieu of any one of the books mentioned, much less all three.

Only recently I was called upon to do some relief work in a store where the only reference books were a Remington, second edition, which I think was printed fifteen years ago, and a District Formulary, which, if I remember correctly, was published in the year 1870. And in one store in which I have visited within the past year there were no books whatever.

I did not venture to ask the proprietor of either of the last-mentioned stores

*Read before the City of Washington Branch, February 18, 1914.

by what means he knew the ingredients and proportions of the preparations he had occasion to make, but I am sure they could not get all of this information from the labels of the fluid-extract bottles, to which each must refer for guidance in making tinctures and some syrups. One of these druggists recently made up eight fluid ounces of tincture of nux vomica from the fluidextract, for a food and drug inspector while the inspector waited. He followed the directions given by the manufacturer of the fluidextract very carefully, and when questioned as to what process he had employed in its manufacture, he informed the inspector (in absolute good faith) that it had been made strictly according to the official process. Further comment is unnecessary.

Scales of many varieties and weights of every character, I have seen in use.

Whether the inspector of weights and measures has control of the prescription balances of a pharmacy I do not know; but if he has, I do not believe he exercises such control to the proper extent.

Some of the balances I have been forced to use actually were not sensitive to a grain, while others required a decided overweight before they would operate at all. Such instruments are not found in every store, but they are not rare.

It has not been unusual to discover a piece of tin foil or other substance on the pan-supports of scales for the purpose of making them balance, and I have actually found one pharmacist who boasts of using for the past twenty years an army prescription balance, original value about \$3.75, with which it is necessary to fasten the pan supports with string.

Conditions of a similar nature with regard to weights have been observed. Any number of pharmacists have no way of weighing less than one grain, and some not less than five. It behooves the proprietors of such stores to use dispensary tablets or to divide quantities of powerful medicines with a spatula.

Weights have not been found to be wholly accurate. For example, some have been allowed to corrode and collect dirt until, in one instance, a drachm weight actually weighed 71.6 grains. The reverse condition frequently occurs when the weights have been polished with a wearing material. Mr. Bradbury, too, has had at least one similar experience. In a store where a new set of balances had just been installed at a cost of \$35.00, he discovered that some of the weights ran 3 to 15 percent over-weight and others correspondingly under-weight. Twice, too, I have had to stop junior clerks from cleaning weights with a strong solution of nitric acid.

Glassware, especially that of a less expensive manufacture, is frequently inaccurate. Since the last meeting I dispensed a two-ounce mixture which could not be gotten into any two-ounce bottle in the store. Yet all of these bottles were graduated for drachms and centimeters, were of good quality glass, and had been made by a reputable firm.

Much has been said in favor of British and German graduates. Yet, few druggists stop to consider that these vessels are graduated for British or Imperial measure, which differs radically from the Apothecary's measure. Repeatedly inaccuracies arise from this cause.

At this point I wish to state that I have on several occasions seen the *avoirdupois* and apothecary's ounces used interchangeably without regard to their difference of $42\frac{1}{2}$ grains. The average druggist does not possess an apothecary's

weight heavier than two drachms, and it must seem logical to him to use the ounce weights which he possesses, namely, avoirdupois, wholly forgetting that they belong to a different system of weights. Not long ago a most conscientious local druggist was found selling camphorated oil below standard. A discussion of its manufacture showed that he had used avoirdupois ounces for troy when weighing his camphor.

Repeatedly, too, I have been in stores with one and two spatulas, one mortar, one graduate, and no percolators, each condition named certainly being a most marked and unquestioned deficiency. Yet, I have heard proprietors of such stores complain that they were not getting their share of the prescription business. Does any one understand why they should get any prescription business whatever?

I do not attribute these delinquencies to anything but thoughtlessness and a desire to spend as little money as possible in the conduct of the business. But should such negligence and carelessness be tolerated?

It can not be prevented under the present laws governing the practice of pharmacy in the District of Columbia, and never will be corrected until we have an adequate pharmacy law.

New York regulates the equipment of a pharmacy to a limited extent, the following being the rules in force:

a. Every pharmacy and drug store shall own and have on file at all times the eighth decennial revision of the Pharmacopœia and the latest edition of the National Formulary, and no registration certificate shall be issued to a pharmacy or drug store until it complies with this rule.

b. Every registered pharmacy and drug store is required to have the following minimum equipment of utensils:

One base scale capable of weighing one grain or less.

One set of accurate troy weights from one grain to two drachms.

One set of metric weights from 50 milligrams to 20 grams.

A set of graduated glass measures, two or more in number, capable of measuring from 10 minims to 16 fluid ounces.

A set of glass graduated measures from 5 cubic centimeters to 500 cubic centimeters.

Why were these regulations promulgated? Because they were necessary for the welfare of the public and for the good of pharmacy.

It would be impracticable to embody all the regulations necessary for the control of the practice of pharmacy into one or several laws, but the formation of a Board of Pharmacy composed of practicing pharmacists, five, seven, or nine in number, whose rules and regulations would completely govern local pharmacy conditions, appeals to me. Such a board, with its legal advisor, and aided by two or three inspectors, who should be pharmacists, could enforce remedial regulations which would raise the standard of our pharmacies to the proper plane. I know of no other way in which this can be done.

THE PATENT MEDICINE PROBLEM.*

M. I. WILBERT, WASHINGTON, D. C.

The patent medicine problem, as it presents itself to American pharmacists today, is neither novel or popular and its continued growth has long since been recognized as a menace to the development of pharmacy as a desirable occupation. The business itself has developed as the joint off-spring of cupidity and credulity and from a very early period has been the one object regarding which members of the various branches of the drug trade have differed on more frequently and more widely than on any other.

While it is generally recognized that the manufacture, sale and use of so-called patent medicines should be considered primarily as a public health problem, the business from the drug trade point of view also involves economic questions which cannot well be ignored and which have at times at least, quite overshadowed all public health considerations. That the economic feature of the problem is on the increase rather than decrease is evidenced by an editorial in the *National Druggist*, (1912, v. 42, p. 414), which asserts that the number of establishments engaged in the manufacture of patent and proprietary medicines in 1899 was 2,154 and in 1909 was 3,642. The value of the products at the factories in 1899 was \$88,791,000 and in 1909 was \$141,942,000, an increase of approximately 70 per cent in ten years.

Whether the public health or the economic side of the problem is to be given the preference in the near future is a question that is well worth considering, and one which by the recent action of the American Pharmaceutical Association is once more set squarely before the American pharmacists for reply or action.

The patent medicine problem as it is now before the members of the American Pharmaceutical Association for discussion, was outlined in an editorial by the general secretary of the Association, in the *Journal* for April, 1913, (p. 425-428). This editorial points out that the duty of the pharmacist to himself and to the public, in connection with patent medicines, is to define, if possible, the legitimate status for remedies of this kind and to differentiate between acceptable and non-acceptable preparations.

This proposition was presented to the Council of the American Pharmaceutical Association at the Nashville meeting and after considerable discussion it was agreed to appoint a Commission on Proprietary Remedies to consider the following general propositions:

1. To inquire into and report to the Council from time to time upon the general subject of proprietary medicines, in their relations to pharmacy, medicine and the public health.

2. To inquire whether any of the proprietary medicines, commonly known as patent medicines, contain alcohol or narcotic drugs in sufficient amount to

*Read before the City of Washington Branch, February 18, 1914.

render them liable to create a drug habit, or to satisfy such habits where otherwise created.

3. To inquire whether, or to what extent, the commonly advertised patent medicines contain potent drugs in sufficient amount to render them dangerous in the hands of the laity.

4. To inquire into the extent to which patent medicines are fraudulently advertised, or differ in properties or origin from the claims made for them, and the extent to which they are advertised for the cure of diseases generally recognized by the medical science as at present being incurable." (J. Am. Pharm. Assoc., 1913, v. 2, p. 1195.)

As the Commission has so far as known, made no report to the Council of the American Pharmaceutical Association, there is as yet, no indication as to what will or will not be the attitude of this Commission toward the preparations now on the market or to be marketed in the future. Some idea of the stand that must be taken by the members of the Commission, if they desire to make for progress rather than retrogression is evidenced by what has already been accomplished, not alone by the American Pharmaceutical Association, but also by other related organizations, particularly the American Medical Association.

Not to go too extensively into the history of the agitation relating to the manufacture and sale of patent medicines, more popularly designated as nostrums, we may well confine ourselves to the published records of the two national associations directly interested; the American Pharmaceutical Association and the American Medical Association, both organized over sixty years ago.

The American Medical Association almost annually, from the time of its preliminary meeting in the city of New York in 1846, to its reorganization at Saratoga Springs in 1902, adopted resolutions condemning nostrums and secret remedies of all kinds and pointed out objectionable features connected with them. Previous to the reorganization of the Association on the present basis, however, little or nothing of practical value was accomplished.

The American Pharmaceutical Association has also devoted considerable time and space to the discussion of problems connected with the manufacture and sale of patent and proprietary remedies. A cursory review of the proceedings of the Association suggests the rather interesting fact that this agitation appears to have developed in cycles and to have been markedly acute in decennial waves; the maximum height of the agitation being evidenced in the early years of the decennium. Thus, beginning with the Proceedings for 1853, the second meeting of the Association, we find the following resolution, which was on a motion of Joseph Laidley, substituted for one previously offered by C. B. Guthrie, and adopted by a majority of the members present:

"Resolved, That the American Pharmaceutical Association believes that the use and sale of secret or quack medicines is wrong in principle and is in practice attended with injurious effects to both the profession and the public at large, and believes it to be the duty of every conscientious druggist to discourage their use."

"Resolved, That this Association earnestly recommend to our pharmaceutical brethren to discourage by every honorable means the use of these nostrums; to

refrain from recommending them to their customers; not to use any means of bringing them into public notice; not to manufacture or to have manufactured any medicine, the composition of which is not made public; and to use every opportunity of exposing the evils attending their use, and the false means which are employed to induce their consumption." (Proc. Am. Pharm. Assoc., 1853, p. 17.)

The agitation in the next decennium was largely centered about the manufacture of fluidextracts and the development of proprietary rights in preparations of this type, and ten years later we find a similar line of activity developing in connection with elixirs, which at that time were so popular. At the end of another decennium, however, the attention of members of the Association was again directed to patent medicines of the nostrum type by a resolution offered by Prof. A. B. Prescott, of Ann Arbor, to the effect that a committee of three members be appointed to agree upon the most feasible and suitable legislation to secure a sufficient statement of the composition of proprietary medicines on the package of the same, and that more feasible and efficient action be taken by the Association in regard to the matter. The committee appointed consisted of Albert B. Prescott, Frederick Hoffmann and Charles Rice. This committee at the succeeding meeting of the Association presented a lengthy report on the nature of desirable legislation regarding the manufacture and sale of proprietary remedies, and also a draft of an act regulating the sale of proprietary medicines. The committee in its report offered a resolution which was subsequently adopted by the members of the Association present, to the effect "that it is the deliberate opinion of this Association that labels of proprietary medicines ought to carry a statement of their constituents." (Proc. Am. Pharm. Assoc., 1885, v. 33., pp. 394-398.) As evidence of the need for action along these lines the committee said in part:

"All medicines, and articles used as such, concern the health of those who use them and put dependence upon them. By action or failure of action, a medicine is liable to prove hurtful when misapplied. Therefore it is the right of a purchaser of a medicine to receive information of its constituents, their names and proportional quantities. And it is a legitimate act of the State—so far as it deems expedient—to see to it that such information, in printed form, is placed upon each package of articles of medicines, as a condition of their legal sale.

"Moreover, legislation requiring the composition of medicines to be given to the consumer is entirely in accord with the spirit of the institutions of the United States, because it is legislation to secure to him the means of self-preservation. If the purchaser of a medicine is provided with a record of its constituents, given in terms defined by published standards: now he may guide himself, in his own discretion or with professional aid, by the information given in the record of constituents, or he may neglect to so guide himself, and depend upon advice given on the wrapper of the medicine, in the exercise of his personal responsibility. The State has done its duty, and given the individual the opportunity for the exercise of discretion. The opportunity has an educational value to the individual."

The following year the Committee on Legislation, in its report of progress,

(Proc. Am. Pharm. Assoc., 1886, v. 34, pp. 10, 154-155) included a resolution to the effect that:

"Whereas, All medicines concern the health of those who use them; and

"Whereas, The purchaser of a medicine selected by himself has the right to receive information of its constituents and their quantities; and

"Whereas, The report and the draft of a law regulating the sale of proprietary medicines, which was accepted by the American Pharmaceutical Association at its meeting held in September, 1855, embraces a method whereby the above mentioned object may be secured; therefore be it

"Resolved, That the President and other officers of the Association be authorized and instructed to present printed copies of the reports and of the action had in this Association upon said reports, to the Governors, to the Speakers of the Senates and Houses of Representatives, and to the State Boards of Health, of the different States of the United States; also to offer any services wherein these authorities may consider the co-operation of this Association desirable or useful."

This preamble and resolution were vigorously discussed and a motion that they be stricken from the minutes of the Association was defeated. The report of the Committee was then on motion accepted, and finally on motion of C. Lewis Diehl, seconded by C. S. N. Hallberg, the preamble and resolution were adopted.

Despite the endorsement given the report of the Committee of Legislation, little or nothing of a practical nature appears to have been done. During the early years of the succeeding decade a few isolated papers on patent medicine abuses, from a public health point of view, were presented but their readers found no following and the resolutions they offered appear to have been overlooked or ignored while much of the time of the Association was devoted to the discussion of a plan or plans to remedy the "cutting of prices." The seriousness with which time was wasted on the discussion of the several plans that were suggested at that time serves well to illustrate the comparative importance that has been accorded the purely economic side of this problem by various branches of the drug trade.

At the semi-centennial meeting of the American Pharmaceutical Association, in 1902, several papers were again presented, bearing on existing abuses in connection with patent and proprietary remedies. These papers dealt principally with the abuse of so-called proprietary medicines and their use by physicians and, perhaps, contributed somewhat at least to the renewed interest on the part of the American Medical Association in matters relating to the use of secret or semi-secret remedies by medical practitioners.

At the meeting of the American Medical Association in New Orleans in 1903 a number of papers were presented criticizing medical journals for the nature and kind of advertising carried by them, and a resolution adopted by the then Section on Materia Medica and Pharmacy condemned much of the advertising then carried in the Journal of the Association itself. At this meeting of the Association provision was also made for pharmaceutical membership in the American Medical Association and at the meeting in Atlantic City the following

June a number of pharmacists were elected and the discussion on materia medica subjects, with the resolutions adopted at Atlantic City in 1904, no doubt were directly responsible for the inauguration of a Council on Pharmacy and Chemistry, the object of which was to endeavor to differentiate between good and bad proprietary remedies used by or offered to physicians.

A preliminary meeting of persons interested was held in Philadelphia on December 29, 1904, and the Council itself was organized in Pittsburg on February 11, 1905. This Council was immediately set to work and by June of the same year the comprehensive and at that time startling report on the acetanilide mixtures was published in the Journal of the American Medical Association and, as was expected, precipitated the wrath, not alone of pharmaceutical manufacturers, but also of medical journals that depend so largely on their advertising pages for existence. The so-called acetanilide report served, however, to arouse the better class of medical men to an appreciation of their duty as professional men and the endorsement thus secured has contributed much to maintain the Council despite the attacks of moneyed interests within and without the membership of the Association.

The work of the Council was later in the year efficiently augmented by the series of articles originally published in Collier's Weekly by Samuel Hopkins Adams, on the "Great American Fraud," and subsequently reprinted in pamphlet form by the American Medical Association. The Food and Drugs Act of June 30, 1906, also contributed its share in support of the work of the Council. These several agencies have been further augmented by the stand taken by the Commissioner of Internal Revenue in regard to alcohol-containing nostrums and by the assistance given by various state officials entrusted with the enforcement of local food and drug laws, so that at the present time there is considerable evidence to show that the efforts of the Council on Pharmacy and Chemistry have made a distinct impression on thinking laymen as well as on the more progressive members of the American Medical Association.

Following the inauguration of the Council on Pharmacy and Chemistry, the American Medical Association organized a chemical laboratory in the Association building and this laboratory in addition to the work on "Proprietary Remedies," has devoted considerable time to the examination of so-called "patent medicines" or "nostrums." The resulting analyses are usually published in the Journal and have been in part at least, compiled in book form in a volume entitled, "Nostrums and Quackery."

This book has recently been reprinted in enlarged form and its increasing circulation among well informed laymen will contribute much to a better understanding of the patent medicine problem from a public health point of view and should serve to prevent any possible retrogressive action on the part of the American Pharmaceutical Association as an Association.

In summing up this brief and admittedly incomplete survey of recent accomplishments to solve the "patent medicine" problem, it would appear that the questions involved are not to be considered as being answered until they are answered correctly and that from the point of view of the public the influence of "patent medicines" on the health and welfare of the individual is the only factor deserving of consideration. Bearing this latter fact in mind, it would appear de-

sirable that all branches of the drug trade give the patent medicine problem renewed and serious consideration and make an honest effort to adjust their interests in accord with the interests of the public and thus effectually counteract the frequently made assertion that the economic questions involved must outweigh all others so far as the drug trade may be concerned.

PETROLATUM LIQUIDUM, U. S. P. VIII.*
(Paraffinum Liquidum. White Mineral Oil.)

S. L. HILTON, WASHINGTON, D. C.

The U. S. P. VIII provides that this substance shall conform to the following description:

"A mixture of hydrocarbons, chiefly of the methane series, obtained by distilling off most of the higher and more volatile portions from petroleum and purifying the liquid residue.

"A colorless, or very slightly yellowish, oily transparent liquid without odor or taste but giving off, when heated, a faint odor of petroleum."

Sp. G., .870 to .950 at 25° C. Tests are given for solubility, acid impurities, fixed oils or fats, either animal or vegetable and readily carbonizable impurities.

It is proposed for the U. S. P. IX, to change the official title to Paraffinum Liquidum, which seems to be wise and in conformity to modern standards. The description, allowing a very slight yellow color, is a mistake as there is no difficulty in obtaining a colorless oil, except the oils of this kind that are produced in this country. The new requirement that it shall be free from fluorescence is proper and not necessarily exacting.

From a careful study of a number of samples of White Mineral Oil, obtained from various sources, the appended table shows that the official requirements can be met without much difficulty, it is further demonstrated that an oil that is usually above the Sp. G. .870 will show more or less solid paraffin when subjected to a temperature of -4° C., yet in the table two samples, each of the Sp. G. of .875 remained perfectly clear after being subjected to this temperature for eight hours. It is therefore evident that in the process of purification chilling was not thorough or carried on for a sufficient length of time and the final filtration was not performed at the same temperature. The desire to have as heavy oil as possible for internal administration as recommended by Dr. Lane, of London, is no doubt accountable for such a large number of samples with a specific gravity lower than .875, becoming opaque or milky at this temperature.

With proper manipulation and care an oil of the Sp. G. .8755 should show no separation of paraffin on chilling; some standard covering this point should be provided, that is, a minimum specific gravity that will show no separation of paraffin when the oil is subjected to a temperature of at least 0° C.

None of the samples showed an admixture of fixed oils or fats, either animal

*Read before the City of Washington Branch, March 18, 1914.

or vegetable; the test is one that must be carefully applied; the neutralizing of the alkali with strong sulphuric acid, after digestion, is violent unless it is added very slowly.

The results of the Sulphuric Acid Test are most interesting, showing almost every shade of brown, and in several cases the oily layer became opaque and colored, and not conforming to the requirements of the U. S. P., the British Pharmacopœia or the German Pharmacopœia.

As to the internal administration of Paraffin Oil, a number of specialists of this city have used it for several years. The principal method followed by them is to administer from 15 to 60 cc. at bed-time; in obstinate cases of constipation 15 cc. administered about one hour before meals, so as to avoid interfering with digestion. With these methods of administration good results have been produced; there are however, many cases of complaints that the oil will pass out of the intestinal tract involuntarily very much to the discomfort of the patient, even when given in very small doses. This trouble seems to be more frequent with the administration of one of the popular brands of the market which shows a specific gravity of less than .860.

Paraffin oils of a specific gravity of .880 or more are rather more difficult of administration than those of .870 to .875. They adhere to the mouth very closely and to some are disagreeable and suggestive of Castor Oil.

An oil aromatized or flavored with some essential oil or combination of oils seems to be growing in demand. I submit ten samples, any of which no doubt would be agreeable to some. Personally, peppermint seems to be the most pleasant and agreeable, cardamon a close second; no doubt many would prefer spearmint, owing to the chewing gum craze.

The flavoring of paraffin oils must be done with care; from 5 to 25 drops of an essential oil will be found sufficient for 500 cc. While this small amount may not give a pronounced odor, it must be remembered that the dose administered, 15 to 60 cc., will be sufficient to give a fairly pronounced taste. The samples submitted contain in each 500 cc. the following amounts of essential oils: almond 15 drops; clove 10 drops; anethol 10 drops; cinnamon 5 drops; peppermint 15 drops; spearmint 15 drops; sweet birch 25 drops; wintergreen 25 drops; and aromatic, using the oils constituting spirit aurantii comp. 15 drops.

Another interesting phase of the examination is the various prices charged for these paraffin oils, those with fancy coined names commanding very much more than other oils on the open market and all or nearly all coming from the same source and possibly from the same importer. As pointed out by Mr. Wilbert, the better or finer grades come from Russia, hence the name Russian Mineral Oil. The American oil usually has a fluorescence, is slightly yellow in color and has a more pronounced petroleum odor when heated. The best grades of Russian oil can be purchased for about 80c a gallon, while those with trade or coined names will cost from 40c to 60c a pint.

Pharmacists are able to supply physicians and their patients with an oil of high quality, reasonable in price and should avail themselves of the present opportunity. An oil of at least Sp. G. .8750, that is colorless, tasteless and free from fluorescence, that will not show more than a pale brown color with the sulphuric acid test, free from admixture with animal or vegetable oils and

remains clear when subjected to a temperature of 0° C. for four hours seems to be the oil most desired, and if demanded, can readily be obtained.

THE RENEWED INTEREST IN PARAFFIN OIL.*

M. I. WILBERT, WASHINGTON, D. C.

Within recent years renewed interest is being taken in paraffin oil for internal administration in the treatment of intestinal stasis or chronic constipation. This renewed interest is largely due to the fact that a noble English surgeon, Sir W. Arbuthnot Lane, in his experimental work to prevent the formation of adhesions after surgical interference in the intestinal tract found that paraffin oil served as an intestinal lubricant and was of material assistance in overcoming persistent constipation.

This use of paraffin oil is by no means new, however, and dates back many years to the introduction of refined petroleum products by Chesebrough and others about 1872.

Previous to this date the residues in petroleum stills had little or no commercial value and were used almost exclusively as lubricants, more particularly axle grease. The possibility of producing an odorless and practically colorless oil and heavier fat by comparatively simple methods, presented the peculiar problem of establishing a market for products of this kind and for some years at least the substances were used largely, if not exclusively, for the adulteration of other fats and oils and it is this use of vaseline and of vaseline oil as adulterants that later led to experiments to demonstrate their possible food value and the presence or absence of harmful or toxic ingredients. Experiments carried on by N. A. Randolph, Philadelphia, about 1884, not only demonstrated that the heavier petroleum products were not absorbed from the intestinal tract but also showed that they served to act somewhat in the nature of foreign material and might have some value in the treatment of certain forms of constipation. It was also thought that these products appeared to inhibit fermentation and would, therefore, be of value in the treatment of certain forms of diarrhoea. Some fifteen years later Robert Hutchison, of England, reported practically the same observations and this led to the then quite extensive use of petrolatum and of paraffin oils for various intestinal disorders.

The at one time widespread use of purified petroleum products in the treatment of pulmonary disorders is, to some extent, traceable to the administration of the naturally occurring petroleum products in various countries and at various times. Crude petroleum has been used from time immemorial as a medicine and perhaps largely because of its disagreeable odor was from very early times used in the treatment of diseases of the respiratory tract. In this country Seneca oil had considerable vogue from time to time and was frequently put out in the form of proprietary or "patent preparations" for the treatment of various diseases. After the introduction of purified petroleum products these were offered as substitutes for the formerly used crude oil and even at the present time the advertising matter put out in connection with some of the popularly exploited prepa-

*Read before the City of Washington Branch, March 18, 1914.

tions of petroleum do not satisfactorily designate whether or not the crude or the purified product is being advocated.

During the past three or four decades, purified petroleum products have been marketed under scores if not hundreds of proprietary names and the misleading claims and statements made in connection with these several preparations are far from being a credit to the owners or to the persons who act as distributors for the several articles. That there is some element of truth in the claims that have been made for petroleum products is evidenced by the fact that the use of petroleum, crude and refined, has persisted in all parts of the world and has at times, like the present, reached amounts that were quite considerable.

With the renewed interest in paraffin oil that is in evidence at present, the time appears to be particularly opportune for pharmacists who are willing to assist in making for true progress to do missionary work and to point out to physicians in a rational and sensible way that paraffin oil and other petroleum products, while they may be useful, must have limitations, that the claims made for the proprietary articles are unfounded and not based on fact, that in the event that the physician does wish to experiment with the product, non-proprietary oils of high quality are readily available and finally, that these non-proprietary products can be sold to the patient at a very much lower figure than can the proprietary article and still yield the retail druggist a more satisfactory profit.

As intimated above, the products that are available at the present time are many, or at least appear to be numerous because of the varied trade names under which they are offered. On studying the nature of these products, however, it appears that there is no very great difficulty in establishing certain, at times perhaps arbitrary, lines of demarcation between them and identifying them as belonging to one or the other class of commercially available oils readily obtainable by any pharmacist.

The bulk of the available supply of heavy mineral oil comes from two sources and the products differ materially in chemical composition. The American oil is obtained from paraffin base petroleum and consists essentially of hydrocarbons of the methane series having the general formula C_nH_{2n+2} .

The so-called Russian oil, obtained largely, if not entirely, from the oil wells in the Baku district, consist chiefly of monocyclic polymethylenes or naphthenes having the general formula C_nH_{2n} . These latter products have been described as hydrated aromatic hydrocarbons and while they behave with reagents very much in the same way as do the hydrocarbons of the methane series, they are more readily purified and generally occur in commerce as water white oils that are quite free from fluorescence or odor. The American paraffin or methane oils usually have a distinct color and are seldom quite free from fluorescence or a peculiar dichroic effect that is particularly noticable when the preparation is viewed by reflected light. Apart from the appearance, however, there is no evidence that the two products differ in their effect on the animal organism and one has perhaps as many advocates and users as the other.

The density of the commercially available products also varies and the fact that it is proposed to extend the present U. S. P. limits of specific gravity, 0.9870 to 0.940 at 25°, to read 0.845 to 0.940 at 25°, clearly indicates that the members

of the present Committee of Revision are themselves not convinced as to the properties that should be inherent in a mineral oil for medicinal use.

The paraffin oil official in the Pharmacopœias of the Continent of Europe are usually of the denser variety, 0.875 or higher at 15°, but this is probably due to the fact that there the oil is largely used as a basis for ointments and the various other uses are only now being developed.

In this country paraffin oil or, as it is better known, liquid petrolatum, has long been in use as a basis for oil sprays in the treatment of affections of the nose and throat and for this purpose the lighter and more limpid oil appears to be preferred. For internal administration Sir A. W. Lane prefers the heavier, European type of oil and this is now available in this country and is being introduced by a number of manufacturers and dealers, under proprietary titles, to be sold at fancy prices. Even for internal use, however, there appears to be a definite limit to the solid paraffin that an oil can hold in solution and be palatable or readily taken. At comparatively low temperatures some of these oils are nearly solid and even at ordinary temperatures they are so viscid that they do not readily leave the mouth when taken internally.

I will not undertake to discuss the various commercially available products in detail or to point out to you the reasons why these heavier oils are objected to by many. Mr. Hilton has made a comparative study of a number of products which he promises to report on and he will also have something to say in regard to methods of administration and the possible flavoring of the oil to make it more palatable.

One further question that may be discussed briefly is the dose. One firm, the owner of the product most widely used in this country, says:

"Excellent results are obtained by giving the oil in small doses. In mild cases a tablespoonful at night gives prompt relief. In longer standing cases make it almost a part of the diet and give one or two teaspoonfuls just after meals."

Dr. Lane and many of his followers, on the other hand, give the oil in much larger doses and insist that it be given shortly before meals so as not to interfere in any way with the digestion of food which it probably would if as proposed above it were given with or immediately after meals and thereby intimately mixed with the stomach content.

Bastedo, in his book on materia medica, pharmacology, therapeutics and prescription writing, states that the oil is only mildly laxative and should be given in doses of 30 cc. two or three times a day. Other authorities advise even larger doses, and Robinson (Medical News, 1900, v. 77, p. 56), reports that he frequently administered nearly a pint in a few hours without any indications of discomfort and no untoward results of any kind. Robinson also asserts that he was able to duplicate the experiments reported by Randolph and reclaim all of the oil that was ingested. Some recent German experimenters, however, appear to believe that a part, at least, of the oil is changed or absorbed in the intestinal tract, and while the bulk of it passes through unchanged it is not possible to reclaim absolutely all of the oil as taken. At the present time, the preferred dose is from one to two tablespoonfuls one hour before meals or from two to four tablespoonfuls on retiring. The oil may be flavored to make it less objectionable,

and several authorities appear to prefer administering the product in the form of an emulsion, though others claim that the emulsion is not so satisfactory and does not give the same uniform good results.

In addition to its use internally as a lubricant or laxative, paraffin oil is also given in the form of rectal injections, and is being exploited more recently as a dressing for wounds, both recent and chronic. In connection with chronic ulcers it is being extolled as a dressing to protect the skin around the focus of suppuration. The oil in these cases not alone protects the skin against irritation from oozing, thus warding off eczema, but also keeps the dressings from sticking.

The use of liquid petrolatum as a soothing application in the form of a spray to inflamed membranes of the nose and throat is well-known, as is the use of the same product in cosmetics, such as skin creams or pomades, and the use of this product for these several purposes need not be discussed.

In conclusion then, the object of this communication is to call attention to the renewed interest that is being manifested by medical men in paraffin oil for internal administration, and as an adjuvant dressing for wounds, and to suggest to pharmacists that they acquaint themselves with the properties of the available material for the purpose of pointing out to physicians the nature and the kind of material that is available as well as the limitations that probably exist.

NEW EQUIPMENT.

A Baltimore druggist had a fine set of black walnut fixtures, twenty years old and good for fifty. His counters were three feet wide and he had six feet of floor space between them. His store was long, dark, narrow, and looked not unlike a tunnel. His wall cases were deep and massive. Everything about the place was gloomy and ponderous. He was persuaded to scrap the whole outfit and put in complete new equipment. In place of the old, heavy black walnut fixtures, new fixtures of a light color were installed. Three-foot counters gave way to counters eighteen inches wide; wall cases were made narrower. He gained six feet of sorely needed floor space. This gave plenty of room for soda-water tables, something he had never been able to use before.

The new store looked 50 percent lighter and had a roomy effect greatly different from that of the old tunnel. The druggist had been urged by the fixture salesman to keep statistics, and did so to the best of his ability. Soda business increased about 100 percent the first month, and was still showing a steady increase at the end of the first year. The general business showed an increase of 60 percent at the end of three months, when the first balance was figured, and an increase of 110 percent at the end of the first year. The equipment this druggist threw away was all fairly good, some of it in prime condition, but it was out of date. It didn't fit in with the times, and here is an important reason why new equipment does increase business.—W. S. Adkins in *The National Druggist*.

Of General Interest

NATIONAL ASSOCIATION OF BOARDS OF PHARMACY.

The joint meeting of the Executive and Advisory Examination Committees of the National Association of Boards of Pharmacy was opened at the Tampa Bay Hotel, Tampa, Fla., February 20, at 11 a. m. At the meeting of the Executive Committee President Berger occupied the chair and, in the absence of Mr. Sala on account of illness, Mr. C. E. Zinn was elected temporary secretary.

Mr. Ben Freer, of the Tampa Druggists' Association, welcomed the members of the National Association in a cordial address, to which Mr. Zinn responded. Mr. J. C. Burton, chairman of the Executive Committee, reported that the committee had secured incorporation for the association; that the Kansas State Board had affiliated with the association and detailed the activities of the committee during the past year. The secretary was instructed to mail to all members of boards of pharmacy in the U. S. a copy of the report of the Executive Committee. The Advisory Examination Committee was directed to take up the work of visiting boards of pharmacy during the examinations of such boards. The secretary was instructed to call in all reciprocal blanks and to reimburse the amounts paid for same. It was also ordered that new blanks be immediately printed and that they should be obtained of the national secretary and that a fee of \$5 must accompany order for same.

At 10 o'clock on February 21 the meeting of the Advisory Examination Committee was called to order by Chairman Christensen. An interesting discussion took place upon the variance of examination-questions of Boards of Pharmacy, and Chairman Christensen presented two examination papers to show the wide difference between these questions. One he characterized as too elemental and the other as too technical, both "entirely lacking in balance or distribution and practically use-

less in so far as to determine the fitness of the candidate." He said that much work had been done looking toward the preparation of questions and it was voted expedient to hold a meeting at St. Louis that questions might be tabulated and methods of improvement devised. On the 23d a joint conference was held, with President Berger presiding. It was the sense of this meeting that many changes must be made by a number of state boards in order to produce that uniformity which should precede reciprocity, and the Advisory Examination Committee were instructed to meet at the earliest possible date to study that question and to notify members of Boards of Pharmacy of the completion of their work and that the questions were available upon request.

A vote of thanks was extended to President Berger, the druggists of Tampa, and to the daily press for courtesies extended the delegates to the Convention.

<>

NATIONAL FOOD TRADES CONFERENCE.

A very important conference was convened at the Waldorf-Astoria Hotel, New York City, on February 27, last, at the meeting of the National Food Trades Conference.

This Convention was called to consider subjects of general interest to those concerned in the manufacture, sale and use of food products, to encourage the greater uniformity of efficient food-control laws and to aid generally in attaining purer and better foods, honestly and properly labelled and advertised.

There were present at the meeting representatives from many national and state associations composed of those interested in food products, among them being the National Civic Federation, the National Wholesale Grocers' Association, the National Retail Grocers' Association, the National Coffee Roasters' Association, the American Spe-

cialty Manufacturers' Association, the National Confectioners' Association, the U. S. Brewers' Association, the National Association of Macaroni and Noodle Manufacturers, the Wholesale Grocers' Association of Pennsylvania, New Jersey and Delaware, the Association of Manufacturers of Products from Corn, the Cocoa and Chocolate Manufacturers' Association, the Millers' National Federation, the Oyster Growers' and Dealers' Association and also from many firms of national prominence, among whom were the Shredded Wheat Co., the Franco-American Food Co., the Pacific Coast Borax Co., the Welch Grape Juice Co., Borden Condensed Milk Co., and Merck & Co. In addition to these many persons of national prominence were in attendance.

The Convention was called to order by Mr. Louis Runkle, the President of the American Specialty Manufacturers' Association. In his opening remarks he said the purpose of the conference was to afford "a forum where our pure food laws might be considered by all interested, to the end that uniformity of these laws may be advanced and better food products be insured to the consumer." He said that the conference was originally called by the American Specialty Manufacturers' Association, for it was, and is, believed that through its medium a spirit of harmonious, cordial and sympathetic co-operation might be evolved to the great benefit of the American people. Uniformity of laws means a strengthening of all legislation, both federal and state, and more efficient administration to the end that a single and best standard would be provided for all, and that equal protection which all citizens of the country should receive and enjoy. He closed his remarks by saying, "Let us therefore confer together in common counsel, and by this conference accomplish a real work in aiding in bringing our laws and their enforcement to that highest point of efficiency throughout this entire nation, so that our national efficiency may be enhanced, both for ourselves and our posterity."

Communications expressing approval of the objects of the conference were read from John A. Wallace, New Castle, Pa., and from many others of national prominence in the movement.

The President of the Board of Health of Greater New York, Dr. S. F. Goldwater, welcomed the conference to the city. He

said that conference was particularly to be welcomed because it promised unity of effort in the direction of pure food legislation, a spirit of co-operation among manufacturers and the public and the representatives of the state law-making power and administrative power. He was encouraged to believe that the results of the conference would reduce the activities of the board of health to a minimum, if it asked the hearty and active co-operation of the manufacturers and producers to join hands in doing what the interests of the community demand.

Mr. George L. Flanders, counsel of the Department of Agriculture of New York, and President of the National Dairymen's Union, addressed the Convention and spoke of the great difficulties of attaining concordant opinions in regard to laws which should be passed and also as to their construction by courts when they were formulated into law. The same law had been declared constitutional in New York and unconstitutional in Pennsylvania, and in the States of Michigan and Minnesota the same disagreement had appeared. The Supreme Court of Minnesota had declared a law relative to the bonding of commission merchants constitutional, while the highest court of Minnesota decided the same law unconstitutional. This state of things might be attributed to the fact that the constitutions of these states were different, and from this fact would naturally result non-uniformity in legislation. Speaking of the difficulty of controlling the use of preservatives in food, he instanced the decision of the courts of New York that, "To preserve food products for the human family is a laudable purpose and any law that says you shall not preserve a food-product contravenes the fundamental principles of our constitution." He referred to the illegal delegation of powers by legislatures to boards and commissions, to make laws and condemned the practice as not only unwise, as tending to further a chaotic state and not a cosmic one, but also as one which would undoubtedly be declared unconstitutional by the courts. If you want standards, get them in the laws, he said, and then get decisions of your courts upon those laws, and if the laws are not right, change them.

The report of the Secretary giving an outline of the action leading to the conference was read and approved.

The report of the Executive Committee was

accompanied by several resolutions as follows, all of which were adopted by the Convention:

Resolved, That the National Food Trades Conference does hereby recommend the appointment of a competent Federal Commission by the President by and with the consent of Congress authorized and directed to investigate the pure food and drug laws of such foreign nations as may appear most advisable, and their administration and enforcement and to report fully the result of such investigation, which report shall include a statement of the existing laws, regulations, standards, methods and such other information as may be of interest, which report shall be published and made available for general use.

Resolved, That this National Food Trades Conference hereby earnestly urges that every effort be made to the end that such uniformity may be as fully realized as possible, in the interest of the general public welfare.

Resolved, That the National Food Trades Conference directs its duly appointed Committee on Collaboration to give this recommendation careful and thorough consideration and to confer with the National Food Control Officials and the Association of American Dairy, Food and Drug Officials and render a complete report thereon at the next meeting of this conference.

Resolved, That the National Food Trades Conference hereby records its warm approval of any changes in the administration of the Federal Food and Drugs Act of June 30, 1906, which may render the operation of that act more effective and extends to the Secretary of the United States Department of Agriculture and the officials co-operating with him in this work this expression of their confidence and best wishes and offers its heartiest co-operation.

Resolved, That the National Food Trades Conference earnestly recommends that the pure food laws of the several states not now so providing be amended so as to incorporate the amendment of the Federal Food and Drugs Act of June 30, 1906, requiring the statement of the net weight, measure or numerical count in the case of packaged food and providing that variations, due to natural or mechanical causes beyond reasonable control, shall be permitted and tolerances and exemptions as to small packages established by rules and regulations.

Resolved, That the National Food Trades Conference hereby recommends that an additional provision be inserted in such state law, if it is not already provided, to the effect that the rules and regulations permitting reasonable variations and establishing tolerances and exemptions as to small packages be in harmony with the similar rules and regulations established under the Federal law.

Resolved, That the Secretary of this conference be and he hereby is authorized and directed immediately to communicate this resolution to the proper officials of the sev-

eral states whose legislatures are now or will shortly be in session, and earnestly urge compliance therewith.

Resolved, That this conference hereby directs its duly appointed Committee on Collaboration to confer and co-operate with the officials of the several states and legislatures of which will be in session during 1915 and with the Association of American Dairy, Food and Drug Officials to the end that the purpose of this resolution may be most fully realized.

Resolved, That the National Food Trades Conference hereby extends to the National Civic Federation in the inception of this important work its very best wishes and suggests and directs its duly appointed Committee on Collaboration to offer its sincerest co-operation.

Resolved, That the National Food Trades Conference hereby strongly endorses an amendment of the Federal Food and Drugs Act of June 30, 1906, which will provide against such an exposure of food to contamination or insanitary conditions as would render it unwholesome and unfit for consumption and requests and directs its duly appointed Committee on Collaboration to confer with the Federal Food and Drug Control officials and with the Association of American Dairy, Food and Drug Officials, to the end that such an amendment may be accomplished at the earliest date and the laws of the several states amended in a similar manner.

Resolved, That the National Food Trades Conference does hereby earnestly endorse these efforts and directs its duly appointed Committee on Collaboration to co-operate with the above named officials to this end.

Resolved, That the National Food Trades Conference hereby offers to the Association of American Dairy, Food and Drug Officials its heartiest co-operation and requests and directs its duly appointed Committee on Collaboration to confer and co-operate with this above named association, in every way, so as to accomplish the most equitable, efficient and uniform food control laws and regulations and enforcement thereof, Federal and state.

Resolved, That the National Food Trades Conference hereby requests and directs its duly appointed Committee on Collaboration to confer with the Federal Food and Drug Control Officials and with the Association of American Dairy, Food and Drug Officials to the end that such action may be taken which may be necessary and proper to qualify, define or limit the use of the guaranty legend as will best fulfill the purpose and operation of the Federal Food and Drugs Act of June 30, 1906.

Mr. Fred R. Drake, of Easton, Pa., former President of the National Wholesale Grocers' Association, read a paper on "National Standards and the Metric System," in which he stated the position of the National Wholesale Grocers' Association to be strongly in favor

of "the compulsory adoption of the metric system in simplification not only of interstate but of international commercial transactions. Dr. Reichmann, Superintendent of Weights and Measures of the State of New York, spoke on "Weights and Measures." Mr. Charles T. Terry spoke of the work of the Commissioners on Uniform State Laws; Miss Mary Wood spoke for the New York State Federation of Women's Clubs in a very clever and interesting address, and Mr. Porter, the President of the Shredded Wheat Co., also spoke on "Uniformity of Legislation," and Mr. T. P. Sullivan spoke of the work of the Illinois Food Commission.

The Convention then adopted a code of rules and regulations based upon that of the National Drug Trades Conference, and elected the following officers:

President—Louis Runkel, American Special Manufacturers' Association.

First Vice President—H. W. Hoops, National Confectioners' Association.

Second Vice President—Theo. F. Witmarsh, National Wholesale Grocers' Association.

Third Vice President—W. M. McCormick, Flavoring Extract Manufacturers' Association.

Fourth Vice President—C. F. Mueller, Jr., National Association of Macaroni and Noodle Manufacturers.

Secretary-Treasurer—John A. Green, National Retail Grocers' Association.

EXECUTIVE COMMITTEE.

The above officers and Mr. A. P. Husband, Millers' National Federation; William B. Harris, National Coffee Roasters' Association; Representative of Oyster Growers' and Dealers' Association of North America.

COMMITTEE ON COLLABORATION.

The above officers and Charles Wesley Dunn, American Specialty Manufacturers' Association; Helen Louise Johnson, Chairman, House Economics Department, General Federation of Women's Clubs; Mary Wood, Chairman of the Legislative Committees, respectively, of the New York State Federation of Women's Clubs and the New York City Federation of Women's Clubs.

The Convention then adjourned, subject to the call of the Chair.

NATIONAL ASSOCIATION OF MANUFACTURERS OF ME- DICINAL PRODUCTS.

The third annual meeting of the Association was called to order at 10:30 a. m. on Tuesday, February 10, at the Waldorf-

Astoria Hotel, New York, by President Frank G. Ryan, of Detroit. After the calling of the roll, the reception of delegates from allied bodies occurred. Prof. Joseph P. Remington brought to the convention the greeting of the American Pharmaceutical Association in a very interesting and eloquent address. He said in part, that the American Pharmaceutical Association sent a warm greeting to her younger sister, and wished her "God speed," for both associations stood for the best in drugs and in medicines; both were a unit in desiring and standing firmly for "whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely and whatsoever things are of good report." He spoke of the particular work of the A. Ph. A. in bringing into common fellowship the members of the different branches of the trade and said that its "very catholicism had been one of its greatest assets." The spirit of union and co-operation shown in the work of the National Drug Trade Conference, which was born from this intimate association augurs well for the future of pharmacy. He expressed the earnest hope that the two associations should co-operate to even a much greater extent to advance and uplift pharmacy.

Mr. Frank E. Holliday spoke for the National Wholesale Druggists' Association, Mr. Harry B. Thompson for the Proprietary Association of America and Mr. George C. Hall for the American Association of Pharmaceutical Chemists. President Ryan responded to these addresses, referring particularly to the address of Prof. Remington.

Dr. A. R. L. Dohme occupied the chair during the delivery of the president's address, which comprised a great range of subjects of interest to the members. He referred particularly to the recently enacted tariff and currency bills and said that with these great questions settled we might look forward with confidence to the prosperity of all legitimate business interests. The other subjects discussed in the address were the indefiniteness with which laws were worded, both Federal and State, and the consequent difficulty of their interpretation; the attempt to repeal the "variation clause" of the Food and Drugs Act; the Harrison Bill, which he strongly approved; the Supreme Court decision in regard to the regu-

lation of prices by the manufacturers, which he criticized; the laws, Federal and State, which were not in harmony; international trade-marks; one cent postage, which he favored, and the remission of dues to the members for the coming year.

The Secretary, Charles M. Woodruff, reported a membership of thirty for the association, a net gain of one, and discussed both national and state legislation very exhaustively. The report of the Committee on Legislation commended the veto of the Governor of Maine of an "Act relative to Misleading Advertisements"; discussed uniform drug legislation, insecticide legislation, and the "variation clause," stigmatizing the effort to repeal the latter as one whose object was to destroy manufacturing pharmacy. It condemned the Sabath bill (H. R. 4653), and said it "should receive the earnest opposition of every well-wisher for pharmaceutical justice and progress," and that it was time to call a halt in all drug legislation. It advised the passage of the following resolution:

"Resolved, That the National Association of Manufacturers of Medicinal Products earnestly recommend that no new laws relating to the subjects be enacted during the present year, unless it be by State Legislatures for the purpose of bringing the State law into conformity with the present Federal law."

The report of the delegates to the National Drug Trade Conference was a very complete review and analysis of the work done by that conference in the framing and the passage of the Harrison bill. It touched on bichloride of mercury legislation, price-protection, the mailing of poisons and the proposed repeal of the "variation clause."

The Executive Committee's report discussed the operation of the laws relating to the licensing of establishments manufacturing viruses, serums, toxins and analogous products and the proposed incorporation of the association. On Tuesday afternoon Prof. Remington addressed the convention on "The Present Status of the Pharmacopœia." He said in part, "The work is going on rapidly now and a large number of the pages of the work are ready to go to press." There never has been a revision in the U. S. P. which has been so thorough and which has been so open. The Food and Drugs Act has been the cause of renewed interest, and "when one's pocket-book

is affected the talk becomes loud." He spoke of the impossibility of the introduction of copyrighted names into the Pharmacopœia and asked, "Will the manufacturers be willing to permit their preparations to be admitted to the Pharmacopœia, with tests for purity and identity under another name?" He spoke of the tests for volatile oils and said that plants at different seasons of the year, or gathered under different conditions of the weather and climate, produced products which vary greatly. Any one reading the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION will keep in touch with the new Pharmacopœia until the book is on the press. The question of including corrosive chloride of mercury tablets had been passed and some method should be devised for distinguishing them. He requested suggestions as to the form this should take. President Ryan spoke of the difficulty of wrapping these tablets and said that girls employed in such work were obliged to wear rubber gloves to prevent corrosion of the skin of the hands.

Ernest W. Bradford addressed the convention on the Kahn bill, now pending in Congress, which is intended for the protection of exhibitors from foreign countries at the San Francisco exhibition. This bill he criticized as defective and likely to make trouble for our people. He said that the Bulkley bill would eliminate the bad features of the Kahn bill.

The Executive Committee presented a memorial respecting the operation of the Federal serum laws and a resolution asking that the memorial be sent to the Secretaries of Agriculture and Treasury and to the Senate and the House of Representatives. The resolution was adopted by the convention.

Mr. Wayland Stearns called attention to the fact that Dr. Alsberg, the government chemist, had believed it possible that a board might be established to pass upon the labels and other printed matter of manufacturers, but that as yet nothing had developed along that line. In the State of Montana this was made the duty of the State Board of Health.

On Wednesday Mr. Samuel C. Henry addressed the convention as the representative of the N. A. R. D. In his address, after comparing the pharmaceutical products of a quarter century ago with those of today

much to the advantage of the latter, he sharply criticized the practice of selling supplies to dispensing physicians. This practice was not an injury alone to the druggists, but to the public and to the manufacturers also.

Resolutions were adopted urging the retention of "the variation clause" in future legislation of Federal and State Legislatures, approving the Harrison anti-narcotic bill, one-cent letter postage, the mailing of medicinal products containing poisons, and one giving approval and support to the National Drug Trade Conference. John F. Queeny, of the Monsanto Chemical Works, submitted a resolution concerning the ruling of the Referee Board in regard to the use of saccharin in food products and the resolution was adopted.

The following officers were elected:

President, Henry C. Lovis, of Seabury and Johnson, New York.

Vice-president, J. K. Lilly, of Eli Lilly & Co., Indianapolis.

Treasurer, Franklin Black, of Charles Pfizer & Co., N. Y.

Secretary, Charles M. Woodruff, Detroit, Michigan.

Executive Committee, A. R. L. Dohme, Adolph G. Rosengarten and the President, Secretary and Treasurer, *ex officio*.

The convention then adjourned *sine die*.

About seventy covers were laid at the Waldorf-Astoria on Wednesday evening for the annual banquet of the association. The after-dinner speakers were Hon. Herbert A. Metz, William F. Bennett, Judge Isaac F. Russell, and C. A. Mayo, the newly-elected President of the A. Ph. A. Ex-President Ryan acted as toastmaster.

CONVENTION OF THE AMERICAN DRUGGISTS' SYNDICATE.

The eighth annual convention of the American Druggists' Syndicate was held at Madison Square Garden the week of January 19 last, and was attended by about four thousand members. Tuesday morning the convention was formally welcomed by Dr. William C. Anderson, who delivered a forceful address in which he spoke of the wonderful growth of the organization in the eight years of its life, and likened its achievement to that of the fathers of the republic

in their struggle against unjust and inequitable conditions. He made a brilliant speech which was frequently interrupted with applause.

Mr. Henry W. Merritt responded to Dr. Anderson's address. In his remarks he strongly condemned those members who treacherously violated their agreements with the company, by which disloyalty the very life of the organization was threatened.

President Frailey, in his annual address, discussed the advantages of co-operation and said that abilities which were latent, were often stimulated into useful activity when occasion was presented for their use, and urged all to an active loyalty to the principles and policies of their co-operative organization in order that it might be developed into a combination of greater force and value.

The report of Secretary Goddard reviewed the work of the previous year and said that notwithstanding the general complaint of "dull business" it had been the "banner year" of A. D. S. history. He reviewed the accomplishments of the company, among the latter being the purchase of the real estate formerly occupied under lease, which comprised thirteen city lots in Brooklyn and the acquirement of a factory for the manufacture of absorbent cotton, sanitary napkins and goods of like nature. He advised also the purchase of the Blanchard Building, now occupied by the company under lease. He discussed the admission of other lines to the work of the company, and said it might find a profitable field in supplying grocers and stationers with their goods. While he favored such extension himself, he deferred to the opinion of the small number of the members (about 15 percent) who thought it unwise, and advised delay in deciding this matter. In an analysis of the condition of the drug trade, he said, there were forty-three thousand stores in the United States. Of these, nine thousand were owned by jobbers, ten thousand which were barely existing and one thousand controlled by the chain-store interests. Of the remaining twenty-three thousand the A. D. S. might expect to add to its stockholders not more than five or six thousand. There was need then of providing for new fields of work and suggested Canada, Central and South America as offering almost unlimited opportunities. He advised the establishment of a
